22469 (MLM–3628-OP) **Ignition of HMX [cyclotetramethylenetetranitramine] using low energy laser diodes.** Ewick, D.W.; Beckman, T.M.; Holy, J.A.; Thorpe, R. EG and G Mound Applied Technologies, Miamisburg, OH (USA). [1990]. 14p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-88DP43495. (CONF-900254–2: 14. symposium on explosives and pyrotechnics, Burlingame, CA (USA), 13-15 Feb 1990). Order Number DE90007637. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The sensitivity of blends of cyclotetramethylenetetranitramine (HMX) with carbon black and graphite to laser diode ignition was investigated. Using a 100-μm optical fiber, a blend of 15,700 cm^2/g HMX with 3% carbon black by weight was the most sensitive material tested, with a threshold of 72 mW. Pure, or undoped, HMX could not be ignited using 10 ms laser diode pulses with power levels up to 880 mW. In general, the HMX/carbon black blends

were more sensitive than the HMX/graphite blends. HMX specific surface area also had a significant effect on sensitivity. Doubling the spot size increased the ignition threshold by a factor of approximately 2.7. Increasing the pulse width from 10 to 100 ms did not significantly reduce the laser diode power required for ignition. Photoacoustic spectrometer was used to compare the absorption characteristics of the HMX blends. The absorption spectra obtained correlated well with the sensitivity test data. 11 refs., 5 figs., 3 tabs.

22470 (SAND–90-0259C) **Pyrotechnic device technology.** Wilcox, P.D. Sandia National Labs., Albuquerque, NM (USA). [1989]. 18p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8909113–7: 14. international pyrotechnics seminar, Jersey (UK), 18-22 Sep 1989). Order Number DE90007683. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This talk was given at the 14th International Pyrotechnic Seminar on September 21, 1989, in Jersey, United Kingdom, as one of two plenary lectures. It briefly surveys the current technology of pyrotechnic devices and examines trends for the future. The "pyrotechnic" can have several meanings. In this talk, "pyrotechnic devices" are devices in which porous materials undergo reduction-oxidation reactions and produce useful products. The pyrotechnic materials are generally fuel-oxidizer systems without binders, in contrast to primary or secondary explosives or propellants. The word "pyrotechnic" is often used to include explosive, squib, propellant, or other ordnance type devices, especially in the European community. The major need for pyrotechnic devices has always been military and defense; however, as technology advances, the civilian uses of pyrotechnics will continue to grow. If every automobile had a pyrotechnic device to trigger its air or crash bag, that application alone would mean millions of devices per year. Applications in safety, fire fighting, law enforcement, and other commercial applications are likely to increase due to the increased capability of pyrotechnic devices and the integration of such devices in system designs. 2 refs., 56 figs.

22471 (UCID–21864) **High-Explosives Applications Facility (HEAF): Final Safety Analysis Report (FSAR).** Morse, J.L.; Weingart, R.C. (comps.). Lawrence Livermore National Lab., CA (USA). Mar 1989. 300p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90008122. Available from NTIS, PC A13/MF A01 - OSTI; GPO Dep.

This Safety Analysis Report (SAR) reviews the safety and environmental aspects of the High Explosives Applications Facility (HEAF). Topics covered include the site selected for the HEAF, safety design criteria, operations planned within the facility, and the safety and environmental analyses performed on this project to date. Provided in the "Summary" section is a review of hazards and the analyses, conclusions, and operating limits developed in this SAR. Appendices provide supporting documents relating to this SAR. This SAR is required by the LLNL Health and Safety Manual and DOE Order 5481.1B[2] to document the safety analysis efforts, The SAR was assembled by the Hazards Control Department, B-Division, and HEAF project personnel. This document was reviewed by B Division, the Chemistry Department, the Hazards Control Department, the Laboratory Associate Director for Administration and Operations, and the Associate Directors ultimately responsible for HEAF operations.

22472 (UCRL–102632) **Computed tomography of PBX9502 high explosives at Lawrence Livermore National Laboratory.** Martz, H.E.; Roberson, G.P.; Skeate, M.F.; Schneberk, D.J.; Azevedo, S.G.; Lynch, S.K. Lawrence Livermore National Lab., CA (USA). [1989]. 57p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8906139–2: 31. weapons agencies nondestructive testing organization, Kansas City, MO (USA), 5-9 Jun 1989). Order Number DE90008305. Available from NTIS, PC A04/MF A01 - OSTI.

X-ray computed tomography (CAT or CT) is an advanced imaging technique which provides cross-sectional views of materials, components and assemblies for industrial nondestructive evaluation. The Lawrence Livermore National Laboratory (LLNL) and the Mason & Hanger-Silas Mason Co., Pantex Plant are cooperating to examine the use of CT Technology to inspect high-explosive pressings. The goal of this joint project is to study high-explosive pressings using computed tomography scanners, to provide a foundation for the development of industrial CT systems, and to work with the private sector on the design and implementation of an automated CT inspection system to be used in the manufacturing process of high explosives (HE) at the Pantex Plant. The early detection of bad HE pressings will reduce the cost and improve the safety of the high explosives production cycle. At present, samples are randomly selected from a pressing lot and are taken and destructively core sampled to obtain an estimate of the internal density gradients. CT holds the possibility of providing a technology base for a high-explosives inspection system with a probability of detection of density variations and voids, as good as or better than present techniques. In addition, CT can be fully automated to allow for a 100% sample inspection. LLNL has the advantage of several different in-house built CT systems to bring to bear on the inspection of high explosives. [MAR88, AZE88, & MAR89] A preliminary study was performed to evaluate the LLNL CT scanners and prove the principles associated with CT on small PBX9502 high-explosive samples. [MAR89a] The presentation at the meeting (Appendix A) summarized the results obtained, and introduced the capabilities of our CT scanners. 10 refs., 24 figs., 1 tab.

22473 **Advances in explosively formed fuse opening switches.** Goforth, J.H. (Los Alamos National Lab., NM (USA)); Caird, R.S.; Greene, A.E.; Lindemuth, I.R. pp. 758 of Proceedings of the sixth IEEE pulsed power conference (technical papers). Bernstein, B.H.; Turchi, P.J. American Society for Surface Mining and Reclamation, Princeton, WV (1987). (CONF-870656–: 6. Institute of Electrical and Electronic Engineers pulsed power conference, Arlington, VA (USA), 29 Jun - 1 jul 1987).

The authors report the development of explosively formed fuses along two separate lines. One design, has now been demonstrated to conduct a 9.5 MA 350 μs risetime pulse and interrupt it in 1.2 μs. Ultimately, this design should operate at up to 15MA with 20-nH loads. A second design with enhanced performance characteristics is being examined and will be tested on a small scale. This design includes opening switch inductance as part of the inductive store and, as a result, should have shorter pulse transfer times and should be able to be scaled to handle currents up to ~25 MA with 20 nH loads.

4502 Nuclear Explosions and Explosives

22474 (AD-A–214875/7/XAB) **STREAK damping. Technical report.** Baker, J.; Peyton, S.; Freiberg, H. S-Cubed, San Diego, CA (USA). 1 Dec 1989. 115p. (SSS-DTR–89-10483). Available from NTIS, PC A06/MF A01.

This report documents a study aimed at improving the damping in STREAK. A form and value for an artificial viscosity is recommended which appears to control ringing and overshoots without overdamping.

22475 (DOE/NV–337) **Tunnel Review Executive Committee report of programs conducted in the Nevada Test Site tunnel complex.** Herbert, E.C. (Holmes and Narver, Inc., Las Vegas, NV (USA)); Holmes, R.C. USDOE Nevada Operations Office, Las Vegas, NV (USA). Feb 1990. 133p. Sponsored by U.S. DOE Defense Programs. Order Number DE90008370. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

In July 1989, the Manager, Nevada Operations Office, directed that a review be conducted of work in tunnel operations performed in support of the Defense Nuclear Agency (DNA) to ensure that responsibilities and authorities were well understood. The Tunnel Review Executive Committee, an ad hoc body, was established to perform the review. Over a period of six months, the Committee organized the review, conducted interviews, and wrote this report. The Committee defined separate phases of work in the tunnels progressing from site characterization through construction, test execution, and reentry. The Committee then developed a list of questions to be answered by review participants concerning their activities in each phase. DISKO ELM, the most recent tunnel event, was used as a model to develop a list of organizations and related operations for review. All principal participants in DISKO ELM and some of the lesser participants (22 in all) prepared and

presented briefings to the Committee. These briefings followed the outline of phases and topics provided by the Committee. An additional 12 organizations provided written statements of their participation following the same outline.

22476 (UCID–20622-89-2) **Chemistry and materials science research report: Second half FY89.** Lawrence Livermore National Lab., CA (USA). 19 Jan 1990. 88p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90008298. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

The research reported here in summary form was conducted under the auspices of Weapons-Supporting Research (WSR) and Institutional Research and Development (IR&D). The period covered is the second half of FY89. WSR is the principal source of discretionary funds to support fundamental research in the Chemistry & Materials Science Department (C&MS). The purpose of WSR is to provide the scientific and technical base that is required in the longer term for success of the Weapons Program. Administratively, WSR is organized into block-funded programs ("thrust areas") and a few smaller projects led by individual investigators. A thrust area is designed to provide a coordinated approach to a focused scientific or technological area and typically involves several senior scientists. The results reported here are for work in progress; thus, they may be preliminary, fragmentary, or incomplete.

22477 (UCRL–100934) **Residual stresses calculated using an effective stress model.** Attia, A.V.; Swift, R.P. Lawrence Livermore National Lab., CA (USA). Nov 1989. 10p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8909163–14: 5. symposium on containment of underground nuclear detonations, Santa Barbara, CA (USA), 19-21 Sep 1989). Order Number DE90008364. Available from NTIS, PC A02/MF A01 - OSTI.

The effect of water content in saturated porous rocks is of interest in assessing the transient rock response to underground nuclear explosions. The interaction of the water-filled pores with the rock matrix is represented in an "effective stress" constitutive model. Separate equations of state are used for the rock and the water. The effective stress governs the failure response of the rock. Effect of water drainage is assumed to be negligible during early transient response to shock loading of interest. For comparison, a simpler constitutive model is also described. This model represents the saturated porous rock as a homogeneous mixture, using a single equation of state. The associated total homogeneous stress governs the failure response. These models have been incorporated into the 2D explicit finite-element code DYNA-2D. Stress fields around the explosively generated cavity are calculated for a particular event using the "Effective Stress" and the "Total (homogenizes) Stress" models, and results are discussed. 6 refs., 12 figs., 2 tabs.

22478 (UCRL–100962) **Recent nuclear cavity pressure measurements.** Hudson, B. (Lawrence Livermore National Lab., CA (USA)): Stubbs, T.; Nilson, R.; Peterson, E. Lawrence Livermore National Lab., CA (USA). Sep 1989. 8p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8909163–13: 5. symposium on containment of underground nuclear detonations, Santa Barbara, CA (USA), 19-21 Sep 1989). Order Number DE90008362. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

An underground nuclear test is typically conducted in an emplacement hole hundreds of metres deep that has been back-filled with sand gravel and concrete plugs. These plugs, which vary in thickness and strength, serve not only to prevent radioactive material from reaching the surface but also, ideally, to constrain it to a region near the explosion cavity. When we determine the appropriate depth of burial (DOB) for a device, we have to make it shallow enough to be economical but deep enough to reasonably ensure containment given the expected yield of the device and the particular geology of the hole. To do this, we have developed sophisticated computer models that consider each site's geologic structure and physical properties to predict explosion effects such as ground motion, confining stresses around the cavity, and cavity pressure. However, to be able to assess the performance and relative accuracy of these computational models, we must develop a data base of the measured values for each of these effects that can be compared with predictions. This report discusses pressure measurements and devices at the Cornucopia, Mission Ghost and Rhyolite Events.

4503 Nuclear Explosion Detection

22479 (AD-A–214595/1/XAB) **Comparison of the spectral characteristics of nuclear explosions detonated below and above the water table. Report for March 1988-February 1989.** Gupta, I.N.; Lynnes, C.S.; Chan, W.W.; Wagner, R.A. Teledyne Geotech, Alexandria, VA (USA). Alexandria Labs. Apr 1989. 79p. (TGAL–89-04). Available from NTIS, PC A05/MF A01.

A comparison of the spectra of nuclear shots detonated below and above the water table (WT) is made by analysis of mostly the regional phase Pn recorded at two common stations. Parameters derived from each record include estimates of corner frequency F_c and the low-frequency spectral level A_0, after the spectra have been corrected for the effects of spatial attenuation. The time-domain measurements of A/T, a measure of m_b, are also made on each observed record. Results from 22 Nevada Test Site (NTS) shots recorded at the DWWSSN digital station, JAS, indicate that plots of f_c versus A_0 show some separation between the below and above WT populations whereas plots of f_c versus A/T show no significant separation. For a fixed yield, f_c for shots below and above WT are nearly indistinguishable whereas both A_0 and A/T are considerably larger for shots below WT than for those above WT, presumably due to improved source coupling of shots in water saturated environment. A comparison of yields estimated from A_0, A/T, A_0 combined with f_c, and A/T combined with f sub c demonstrates that substantially more precise yield determinations can be made if it is known whether the shot was detonated above or below WT. Results from the analysis of 17 NTS shots recorded at the RSTN station, RSSD are generally not as well defined but appear similar to those from the JAS recordings. The largest difference between the below and above WT shots of a given yield lies in their low-frequency spectral level and, to a slightly smaller extent, in their M_b values.

22480 (SAND–89-2262C) **Seismic data processing using digital signal analysis techniques.** Phillips, J.S.; Stearns, S.D.; Long, J.W. Sandia National Labs., Albuquerque, NM (USA). [1990]. 5p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-900599–2: 36. ISA international instrumentation symposium, Denver, CO (USA), 6-10 May 1990). Order Number DE90006185. Available from NTIS, PC A02/MF A01 - OSTI.

This paper summarizes some of the unique features of the digital signal analysis techniques used to process seismic acceleration data and provides examples of the results. First an overall description of the automated package is presented. The package consists of several programs and routines that process the acceleration waveforms to enhance signal-to-noise ratio, filter, integrate, perform spectral computations, etc. Next, we discuss some specific problems and solutions associated with integrating the acceleration data twice to produce displacement waveforms and hodographs. A frequency domain integration scheme is described. Finally, we describe a system for archiving the inputs and outputs of the automated package. The archives provide an extensive data base of ground motions from underground nuclear explosions. 7 refs., 8 figs.

22481 (SAND–89-2293C) **A linear filtering technique for removal of low-frequency noise.** Long, J.W.; Stearns, S.D. Sandia National Labs., Albuquerque, NM (USA). [1990]. 5p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-900599–1: 36. ISA international instrumentation symposium, Denver, CO (USA), 6-10 May 1990). Order Number DE90006183. Available from NTIS, PC A02/MF A01 - OSTI.

In an analog recording of an electronic pulse, the baseline of the recording can shift during the test. Before accurate processing can be performed on the recorded pulse, the baseline must be identified and adjusted so deflections may be measured from a zero baseline. A simple high-pass filtering method to identify and remove the baseline deviations has been devised and implemented. The

primary advantages of this method are that little or no lead time is needed to initialize the filter, and data which cannot be processed with standard filters because of problems caused by filter response, may be successfully processed with this method. This paper explains how the baseline is identified and removed and provides examples using ground-motion accelerations recorded during underground nuclear tests at Nevada Test Site. 3 refs., 6 figs., 1 tab.

4504 Nuclear and Radiological Warfare

22482 (AD-A–215037/3/XAB) **Preliminary report on the feasibility of high-power electronic warfare (EW) using explosive energy sources.** Clark, G.A.; Sadedin, D.R. Materials Research Labs., Ascot Vale (Australia). Mar 1989. 27p. (MRL-TR–89-3). Available from NTIS, PC A03/MF A01.

Electronic warfare (EW) is an extremely important element in modern military conflicts. One form of EW involves jamming where, in general, the effectiveness increases with the power level that can be employed. Within the constraints of the upper power limit it would seem to be possible to raise power levels to the point where components are damaged. The required high powers for such EW functions can be produced by compact magnetohydrodynamic (MHD) power sources using fuels such as explosives or propellants. Some indicative applications are discussed and areas for research are identified.

22483 (AD-A–955741/4/XAB) **Regional rivalries and nuclear responses. Volume 2. The south korean case: A nuclear weapons program embedded in an environment of great power concerns. sanitized. Final report, 8 November 1976-28 February 1978.** Jack, B.; Agmon, M.; Head, S.L.; McGarvey, D.; Rowen, B. Pan Heuristics, Los Angeles, CA (USA). 28 Feb 1978. 152p. (PH–78-02-794-43-V-2). Available from NTIS, PC A08/MF A01.

No abstract available.

4505 Strategic Defense Initiative

22484 (AD-A–214874/0/XAB) **Development of advanced WTA (Weapon Target Assignment) algorithms for parallel processing. Final report.** Castanon, D.A. ALPHATECH, Inc., Burlington, MA (USA). Oct 1989. 89p. (TR–457). Available from NTIS, PC A05/MF A01.

The objective of weapon-target assignment (WTA) in a ballistic missile defense (BMD) system is to determine how defensive weapons should be assigned to boosters and reentry vehicles in order to maximize the survival of assets belonging to the U.S. and allied countries. The implied optimization problem requires consideration of a large number of potential weapon target assignments in order to select the most effective combination of assignments. The resulting WTA optimization problems are among the most complex encountered in mathematical programming. Indeed, simple versions of the WTA problem have been shown to be NP-complete, implying that the computations required achieve optimal solutions grow exponentially with the numbers of weapons and targets considered in the solution. The computational complexity of the WTA problem has motivated the development of heuristic algorithms that are not altogether satisfactory for use in Strategic Defense Systems (SDS). Some special cases of the WTA problem are not NP-complete and can be solved using standard optimization algorithms such as linear programming and maximum-marginal-return algorithms; these algorithms enjoy low computational requirements and therefore have been adopted as heuristics for solving more general WTA problems. However, experimental studies have demonstrated that these heuristic algorithms lead to significantly suboptimal solutions for certain scenarios.

22485 (ORNL/OMIS–90/1) **The Survivable Optics MODIL [Manufacturing Operations Development and Integration Laboratory]: Guidelines for forming R and D consortia from the theory of clubs.** Katzman, M.T.; Jones, D.W. Oak Ridge National Lab., TN (USA). Mar 1990. 42p. Sponsored by U.S. Department of Defense. DOE Contract AC05-84OR21400. Order Number DE90008131. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Under the aegis of SDIO, a Survivable Optics Manufacturing Operations Development and Integration Laboratory (MODIL) has been established at ORNL. The purposes of the MODIL are to achieve order-of-magnitude cost reductions in the manufacture of optical components and to contribute to the revitalization of the American optics industry. The MODIL is a federal laboratory-university-industry consortium that sponsors manufacturing R&D and aims to transfer this technology to the domestic optics industry by utilizing a manufacturing test bed at ORNL. The purposes of this analysis are: (1) to identify the types of firms that would make the best members of the MODIL, (2) to identify the conditions under which private firms would be willing to participate in the consortium R&D, and (3) to indicate conditions under which firms could supplant the Federal government as the source of funding. The conceptual approach is derived from the economic theory of clubs. A review of the literature on R&D consortia in the United States and Japan and informal interviews with 18 industrial participants in the MODIL provide the empirical basis for conclusions and recommendations. 41 refs.

22486 (UCRL–99967-Rev.1) **Measurement of the stimulated thermal Rayleigh scattering instability: Revision 1.** Karr, T.J.; Rushford, M.C.; Murray, J.R.; Morris, J.R. Lawrence Livermore National Lab., CA (USA). Jan 1990. 14p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-900140–12-Rev.1: SPIE optics, electro-optics and laser applications in science and engineering conference and exhibition, Los Angeles, CA (USA), 15-19 Jan 1990). Order Number DE90007849. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We report the first clear experimental demonstration of large amplification of small-scale spatial perturbations by stimulated thermal Rayleigh scattering (STRS) of a CW laser beam propagating through an absorbing medium in a context normally associated with thermal blooming. A single-mode argon-ion laser beam with λ = 488 nm was propagated vertically downward through a 1.2 m cell filled with CCl_4 that was doped with an absorber to have optical depths in the range 0.5-2.3. A shear-plate interferometer near the cell input generated the perturbation. Fringe growth was rapid and visually obvious, as was competing growth from dust specks, etc. The measured growth rate is in good agreement with the asymptotic rate from analytic STRS theory. 26 refs., 4 figs., 2 tabs.

4506 Chemical and Biological

22487 (AD-A–214475/6/XAB) **Effect of anticholinesterase agents on airway epithelial function. Annual report, 15 July 1888-14 August 1989.** Marin, M.G. Rochester Univ., NY (USA). 15 Sep 1989. 29p. Available from NTIS, PC A03/MF A01.

Irreversible anticholinesterase compounds have potential serious health effects when employed as chemical warfare agents. Intoxication with these agents will cause an accumulation of acetylcholine at nerve muscle and nerve-gland junctions. Because tracheal glands have rich cholinergic innervation, we hypothesized that exposure to anticholinesterase agents, such as soman, would stimulate glandular secretion. This would cause pathological changes in the important lung defense mechanism of mucociliary clearance. Initial work on this contract revealed a dose-related increase in mucociliary transport in the ferret in response to soman. This effect could be inhibited by atropine but not by pralidoxime. The investigation described in this report relates to the effects of soman and its antidotes on glycoconjugate secretion of ferret trachea in vitro.

22488 (AD-A–214699/1/XAB) **Workshop on problems in chemical toxicology. Final report, 19-20 June 1980.** Lindstrom, R.E. Connecticut Univ., Storrs, CT (USA). 20 Jun 1980. 111p. Available from NTIS, PC A06/MF A01.

The bulk of the material in this report was transcribed from the proceedings of a two-day conference on biological aspects of chemical defense. In the meeting, six representatives from the Department of Defense exchanged views on the subjects with an equal number of civilian scientists whose scholarly interests touch on various aspects of the overall chemical problem.

22489 (AD-A–214763/5/XAB) **Fortran program for calculating chemical hazards using the NATO (North Atlantic Treaty Organization) STANAG 2103/ATP-45 algorithm. Memorandum report.** Mellsen, S.B. Defence Research Establishment Suffield, Ralston, AB (Canada). Oct 1989. 34p. (DRES–1275). Available from NTIS, PC A03/MF A01.

The Military Agency for Standardization of the North Atlantic Treaty Organization has issued a draft for the algorithm to be used in calculating the maximum downwind hazard distances after attacks with chemical agents. The purpose of this report is to describe a computer program written in Microsoft FORTRAN Version 4.1 to apply the algorithm to calculate a set of sample results for dispersion over both land and sea for all atmospheric stability categories. Another purpose is to present the results in graphical form for convenient use. The validity of the algorithms is not appraised herein, but the program and results provided can be used for familiarization and as aids in improving the program written for an IBM compatible personal computer. It applies the algorithms of ATP 45 to give quick and accurate calculations for distances up to ten kilometers, under all wind speeds and stability categories, and for all but the lowest wind speed in a very stable atmosphere, for distances up to forty kilometers.

22490 (AD-A–214803/9/XAB) **Molecular probes for elucidating mechanisms of action of chemical threat agents. Annual report, 15 February 1988-14 February 1989.** Wiley, J.C.; Uchic, J.T.; Greenwald, S. Chemsyn Science Labs., Lenexa, KS (USA). Nov 1989. 63p. Available from NTIS, PC A04/MF A01.

This report describes the preparation of the following compounds of interest to the U.S. Army Medical Institute of Chemical Defense: 10R-(+)- and 10S-(-)-physostigmine-d3 (1-methyl-d3), sodium ethanethiosulfate, sodium propanethiosulfate, 2-aminoethanethiosulfate, 3-aminopropanethiosulfate, and 4-aminobutanethiosulfate. In addition, progress towards the synthesis of HLO-7 and an HLO-7 congener as well as 10R-(+)- and 10S-(-)-(^{14}C)physostigmine is documented.

22491 (DOE/EH–0125-Vol.2) **Environmental audit manual: Volume 2.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (USA). Office of Environmental Audit. Jan 1990. 531p. Sponsored by U.S. DOE Environment Health & Safety. Order Number DE90008116. Available from NTIS, PC A23/MF A01 - OSTI.

The primary purpose of this manual is to provide a guide upon which an environmental regulatory compliance audit, assessment, or appraisal of a DOE facility can be conducted, and to ensure that all aspects of a particular regulatory area are adequately and consistently covered. In addition, this audit manual provides lines of inquiry to assess a facility's adherence to environmental best management practices (BMPs). The protocols are in a format such that the results and observations of an audit can be documented and recorded. The ultimate objectives of the use of this manual are to document a facility's compliance with environmental laws and regulations, identify areas of potential noncompliance, and plan for corrective action. Although this manual has been developed by a DOE Headquarters entity, it has been designed for use at all levels within DOE.

22492 (DOE/EH–0125-Vol.3) **Environmental audit manual: Volume 3.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (USA). Office of Environmental Audit. Jan 1990. 437p. Sponsored by U.S. DOE Environment Health & Safety. Order Number DE90008117. Available from NTIS, PC A19/MF A01 - OSTI.

22493 (PNL-MA–580) **Surface environmental surveillance procedures manual: PNL administrative/technical procedures.** Hanf, R.W.; Dirkes, R.L. (eds.). Pacific Northwest Lab., Richland, WA (USA). Feb 1990. 150p. Sponsored by U.S. DOE Energy Research. DOE Contract AC06-76RL01830. Order Number DE90007682. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

The Surface Environmental Monitoring Project is maintained by the Pacific Northwest Laboratory, which is operated by Battelle Memorial Institute for the US Department of Energy (DOE). Environmental monitoring data provide a historical record of the levels of radionuclides and radiation present in the Hanford environs as a result of natural sources, worldwide fallout, and Hanford operations. In addition, the data are used in assessing the impact of site operations, demonstrating compliance with applicable guidelines, and verifying the adequacy of the containment and effluent control systems.

22494 (AD-A–214602/5/XAB) **Reactions of atmospheric species with clean and H, C, and O implanted species. Final report, 1 April 1986-15 July 1989.** Rabalais, J.W. Houston Univ., TX (USA). Dept. of Chemistry. 27 Jul 1989. 131p. Available from NTIS, PC A07/MF A01.

The interactions of low-energy ions with surfaces were studied using surface-science techniques. The energy range studied is from about 1 eV-5 keV, the ions involved are rare gas ions (He(+), Ne(+), Ar(+)) and reactive ions such as N(+)2, N(+), C(+), CO(+), and O(+), and the surfaces included compounds such as K2TiF6, K2NbF7, K2TaF7, and boron nitride (BN) and elemental materials such as graphite, gold, magnesium, nickel, boron, Si(100), and W(211). The phenomena investigated included scattering, recoiling, ion-induced surface damage (decomposition, oxidation, nitridation, chemisorption), inelastic collisions with emission of photons and electrons, scattered and recoiled ion fractions, collisional dissociation, and the dynamics of low-energy collisions. The results are contained in six scientific publications in refereed journals.

22495 (BNL–43838) **Cloud albedo and climate perturbations due to anthropogenic sulfate.** Schwartz, S.E. Brookhaven National Lab., Upton, NY (USA). Jan 1990. 31p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-900173–1: Global Modeling of Atmospheric Chemistry (GLOMAC) workshop, Schloss Ringberg (Germany, F.R.), 28 Jan - 2 feb 1990). Order Number DE90007674. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This paper discusses the climate response to cloud albedo perturbation and the climate response to global CO_2 increase. Despite strong theoretical underpinning for the belief that increases in the concentrations of CO_2 and other "greenhouse" gases will lead to increased global mean temperature, there is no convincing empirical link between changes in radiative forcing and changes in the earth climate. It has been suggested that sulfate aerosol arising from SO_2 emissions associated with fossil fuel combustion may give rise to an enhancement in cloud albedo that results in a perturbation of radiative forcing comparable in magnitude to that of fossil-fuel CO_2, but opposite sign. 37 refs., 10 figs.

22496 (CEGB-RD-L-3481/P89) **Modelling airborne dispersion of coarse particulate material.** Apsley, D.D. Central Electricity Research Labs., Leatherhead (UK). Mar 1989. 32p. (ODMWG/P-(89)1). Order Number DE90619479. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Methods of modelling the airborne dispersion and deposition of coarse particulates are presented, with the emphasis on the heavy particles identified as possible constituents of releases from damaged AGR fuel. The first part of this report establishes the physical characteristics of the irradiated particulate in airborne emissions from AGR stations. The second part is less specific and describes procedures for extending current dispersion/deposition models to incorporate a coarse particulate component: the adjustment to plume spread parameters, dispersion from elevated sources and dispersion in conjunction with building effects and plume rise. (author).

22497 (DLR-FB-89-61) **Retrieval of wind fields from Doppler measurements of a single radar and application on a cold front with narrow rain band.** Hagen, M. (Deutsche Forschungsanstalt fuer Luft- und Raumfahrt e.V. (DLR), Wessling (Germany, F.R.). Inst. fuer Physik der Atmosphaere). Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt e.V., Koeln (Germany, F.R.); Muenchen Univ. (Germany, F.R.). Fakultaet fuer Physik. 1989. 112p. (In German). Order Number DE90759539. Available from NTIS (US Sales Only), PC A06/MF A01; OSIT; INIS.

A method is developed for the retrieval of the horizontal wind vector from Doppler data of a single weather radar. For a horizontal resolution of about 5 km, the accuracy of this method is about 2-5 m/s. This method is applicable for studies of mesoscale phenomena within stratiform precipitation. A cold front with a narrow rainband is studied by this method and additional measurements systems. The wavelike structure of the rainband is caused by windshear and stratification within the frontal zone. The cold front passes the Alpine foreland undisturbed, and is retarded by the main ridge of the Alps for several hours. When reaching the Alps, the prefrontal wind field is modified significantly. The speed of the flow is reduced with a simultaneous increase in the cross-flow circulation. (orig.) With 51 figs., 5 tabs., 72 refs.

22498 (DOE/ER-0441) **Atmospheric Radiation Measurement Program Plan.** USDOE Office of Energy Research, Washington, DC (USA). Atmospheric and Climate Research Div. Feb 1990. 116p. Sponsored by U.S. DOE Energy Research. Order Number DE90008108. Available from NTIS, PC A07/MF A01; OSTI; INIS; GPO Dep.

In order to understand energy's role in anthropogenic global climate change, significant reliance is being placed on General Circulation Models (GCMs). A major goal of the Department is to foster the development of GCMs capable of predicting the timing and magnitude of greenhouse gas-induced global warming and the regional effects of such warming. DOE research has revealed that cloud radiative feedback is the single most important effect determining the magnitude of possible climate responses to human activity. However, cloud radiative forcing and feedbacks are not understood at the levels needed for reliable climate prediction. The Atmospheric Radiation Measurement (ARM) Program will contribute to the DOE goal by improving the treatment of cloud radiative forcing and feedbacks in GCMs. Two issues will be addressed: the radiation budget and its spectral dependence and the radiative and other properties of clouds. Understanding cloud properties and how to predict them is critical because cloud properties may very well change as climate changes. The experimental objective of the ARM Program is to characterize empirically the radiative processes in the Earth's atmosphere with improved resolution and accuracy. A key to this characterization is the effective treatment of cloud formation and cloud properties in GCMs. Through this characterization of radiative properties, it will be possible to understand both the forcing and feedback effects. GCM modelers will then be able to better identify the best approaches to improved parameterizations of radiative transfer effects. This is expected to greatly improve the accuracy of long-term, GCM predictions and the efficacy of those predictions at the important regional scale, as the research community and DOE attempt to understand the effects of greenhouse gas emissions on the Earth's climate. 153 refs., 24 figs., 6 tabs.

22499 (DOE/ER-0442) **Atmospheric Radiation Measurement Program plan: Executive Summary.** USDOE Office of Energy Research, Washington, DC (USA). Atmospheric and Climate Research Div. Feb 1990. 19p. 22500 (DOE/ER/60312-3) **Air pollution-caused changes in photosynthesis: Effects on plant growth and rhizosphere functions: Final report.** Winner, W.E. (Oregon State Univ., Corvallis, OR (USA). Dept. of General Science); Antibus, R.K.; Linkins, A.E. Oregon State Univ., Corvallis, OR (USA). Dept. of General Science. Feb 1990. 70p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-85ER60312. Order Number DE90007184. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

The relationships between plants, soil nutrient status, and rhizosphere symbionts were probed using ozone (O_3), a commonly occurring air pollutant, as an above-ground stress to alter carbon gain. Laboratory experiments were designed to examine O_3 effects on: (1) tree species grown at varying nutrient levels, (2) plants in symbiosis with a dinitrogen-fixing symbiont, (3) plants in symbiosis with mycorrhizal fungi, and (4) plants having both a dinitrogen-fixing symbiont and mycorrhizae. Photosynthesis measurements and growth analysis were applied to detect O_3 effects on plant carbon gain and allocation, respectively. Stable carbon isotope ratios were analyzed as a means of integrating effects of O_3 on gas exchange of leaves over the life of the plant. Transmission electron microscopy detected alterations in plant root cells symbiotic with dinitrogen-fixing bacteria caused by ozone. To better understand the relationship between host plant and mycorrhizal fungi, studies were conducted on utilization of carbohydrate by ectomycorrhizal fungi and metabolism of ectomycorrhizal fungi and roots. Taken together, these studies provide new information on metabolic relationships of plants and symbionts and the effect of O_3 on these relationships.

22501 (DOE/ER/60883-1) **Simulation of landscape disturbances and the effect of climatic change: Technical progress report No. 1, [July 1989-February 1990].** Baker, W.L. Kansas Univ., Lawrence, KS (USA). Dept. of Geography. 1 Mar 1990. 109p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-89ER60883. Order Number DE90007565. Available from NTIS, PC A08/MF A01 - OSTI; GPO Dep.

This first progress report covers the seven month period from July 1989 through February 1990, during which the primary achievements have been in developing the conceptual framework for the model and in writing code. This project is the first to attempt to directly model the effects of changing atmospheric conditions, on the decadal and century scale, on landscapes whose structure is influenced by atmospherically-controlled natural disturbances. The model has a landscape ecological emphasis, meaning that the primary concern is with the patchy structure present in landscapes on the kilometers scale. A central feature of this model, in addition to the tie to atmospheric conditions, is that it contains an analytical tool, the program STRUCT, for monitoring a variety of quantitative changes in landscape structure at several scales as the model runs. 36 refs., 1 fig.

22502 (GSF-BPT-1/89) **Meteorological testing and analysis of sampling equipment for wet deposition.** Winkler, P.

(Deutscher Wetterdienst, Hamburg (Germany, F.R.). Meteorologisches Observatorium); Jobst, S.; Harder, C. Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Bereich Projekttraegerschaften. 1989. 315p. (In German). Contract BMFT 07431073. Order Number DE90759067. Available from NTIS (US Sales Only), PC A14/MF A01.

11 rain collector types for wet deposition were subjected to a field test. Two of the nine types were identically constructed. The following measured values were analyzed: amount of rainfall, electrical conductivity, pH value, Cl^-, NO_3^-, $SO_4^{=}$, NH_4^+, Na^+, K^+, Ca^{++}, Mg^{++}, Fe, Pb, Cu, Cd. The analysis was restricted to rainfall. In a basic study structural and statistical analyses of precipitations were made in order to find out from which extent of intensity resp. rain volume per rainfall the precipitations are important for wet deposition. Some sensors required intensities of nearly 1 mm/h in order to recognize all rainfalls. In order to reach a better standardization of the measuring technique the funnel geometry should be standardized. The current technique is not suited for correctly registering the deposition which is connected with light and very light rainfall. It was found out in rinsing tests with diluted HNO_3 that considerable amounts of trace metals accumulate at funnel walls and in headers, although the collecting device had been subjected to a thorough acid purification before. For the determination of the wet deposition of the trace metals problems arise if the samples are filtered and the filters are not analyzed. In that case particle-bound metals which are suspended in raindrops will not be registered. After comparing the equipment some of the devices were improved in order to eliminate known sources of contamination. (orig./KW).

22503 (GU/G–EN57-27/1989-01) **Climate warming and Canada's comparative position in argiculture.** Climate change digest 89-01. Smit, B. Guelph Univ., ON (Canada). Dept. of Geography. 1989. 31p. (MICROLOG–89-05472). Available from PC Environment Canada, Departmental Library, Ottawa, ON, CAN K1A 0H3; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1. Prices: PC N/C; MF $10 CAN.

A comparative analysis has been undertaken to assess the implications of climate warming for the competitive position of Canadian agriculture. Impacts of an altered climate on Canadian production and trade opportunities for selected crops are assessed relative to impacts in other regions of the world. Information on the impacts of climatic warming on agricultural production in each of the global regions was obtained by reviewing independent studies. A measure of consistency was ensured by assuming a climate change scenario based upon an enriched CO_2 atmosphere and by specifying a range of temperatures for each region. Five approaches were used for estimating the climate change impacts on agriculture: crop yield analysis, spatial shift analysis, spatial and historical analogues, agricultural systems models, and assessments based on expert judgment. Some highlights of the analyses are as follows. Production prospects for wheat and grain corn may be enhanced in Canada and the Soviet Union, and may diminish in most other regions of the world. Opportunities for producing soybeans may decrease in the world's major producing regions, particularly the USA and Central America. The production of rice in Asian countries may increase. Canada's position in production and trade of wheat and grain corn may improve relative to the rest of the world. Impacts are likely to vary among regions in Canada, with ramifications for regional development policies. 3 tabs.

22504 (JAERI-M–89-155) **Environmental radiation data, 7: Background dose rate in and around Tokyo measured with portable instruments.** Nagaoka, Toshi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Sakamoto, Ryuichi; Saito, Kimiaki; Tsutsumi, Masahiro; Moriuchi, Shigeru. Japan Atomic Energy Research Inst., Tokyo (Japan). Oct 1989. 35p. (In Japanese). Order Number DE90759885. Available from NTIS (US Sales Only), PC A03/MF A01.

The Environmental Radiation Physics Laboratory has conducted a large number of background radiation surveys in these years, aiming at the analysis of characteristics and behaviour of environmental radiation, the development of measurement techniques and instruments of environmental radiation, and the evaluation of environmental radiation dose. The environmental radiation data obtained by these surveys are useful for broad purposes as actual survey data. Therefore, it is desirable to make the recording media and the FORMAT of these data available for usual computers. In the light of this circumstance, these data were rearranged and recompiled systematically to meet the demand. This report mentions about the data obtained by the background radiation surveys in and around Tokyo performed during 1982 - 1988 using portable instruments, as well as the information necessary for the data handling. (author).

22505 (KFK-PEF–54) **Cost-effectiveness-analysis of strategies to reduce the SO_2- and NO_x-emissions in Baden-Wuerttemberg considering regional aspects.** Boysen, B. (Stuttgart Univ. (Germany, F.R.). Inst. fuer Kernenergetik und Energiesysteme); Mattis, M.; Friedrich, R.; Voss, A. Kernforschungszentrum Karlsruhe GmbH (Germany, F.R.). Projekt Europaeisches Forschungszentrum fuer Massnahmen zur Luftreinhaltung (PEF). Sep 1989. 110p. (In German). Contract PEF 87/001/4. Order Number DE90759333. Available from NTIS (US Sales Only), PC A06/MF A01; OSIT; INIS.

Costs and effectiveness of several measures for reducing SO_2- and NO_x-emissions are evaluated. Regional aspects can be taken into account due to the calculations on county-level. At first the emissions are calculated for each of Baden-Wuerttemberg's 44 counties in the year 1985. The next step is the estimation of the emissions for the year 2000 on the base of the fuel use expected. This projection considers all measures which are necessary to meet the existing and future laws. In addition to this the costs and the effects of further abatement measures are given. From the results it is possible to get information about the costs necessary to reach a certain level of emissions. Furthermore it is known which measures have to be taken. From the results strategies and recommendations for a cost-effective air-pollution-control policy can be developed. (orig.) With 42 figs., 62 refs.

22506 (MCC–CE02780, pp. 279-284) **Perturbations in atmospheric density caused by high rise buildings and their effects on astronomical observations: A case study.** Kirts, R.E. (U.S. Naval Civil Engineering Lab., Port Hueneme, CA (USA)); Kodres, C.A. MCC Systems Canada, Inc., Toronto, ON (Canada). 1989. (CONF-890615–: Building simulation '89, Vancouver (Canada), 23-24 Jun 1989; CE–02780). In *Proceedings of building simulation '89.* Available from MCC Systems, 30 Wellington St. E, Suite 202, Toronto, ON, CAN M5E 1S3. Prices: $90.00 CAN.

Proposed construction of high rise buildings near the U.S. Naval Observatory in Washington D.C. caused astronomers to ask what effect the heat released by these buildings would have on their ability to make accurate observations. Models of the thermal performance of the proposed buildings were developed and used to estimate the rate of heat release to the atmosphere. The building heat release rates, along with other data, were input to a finite volume fluid mechanics computer program which was used to model the atmosphere near the Naval Observatory. The atmospheric model produced estimates of the gradients in air density above the Observatory. The atmospheric model produced estimates of the gradients in air density above the Observatory. From these air density data it was estimated that the proposed construction would diminish the accuracy of the Observatory's measurements by a factor of several times the currently acceptable error. 2 refs., 6 figs.

22507 (MO/G–57-27/1988-08) **The implications of climate change for natural resources in Quebec.** Climate change digest, 88-08. Singh, B. Montreal Univ., PQ (Canada). Dept. of Geography. 1988. 34p. (MICROLOG–90-01110). Available from PC National Climatological Information Services, CCAS/I, 4905 Dufferin Street, Downsview, ON, CAN M3H 5T4; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1. Prices: PC N/C; MF $10 CAN.

This report presents the summary results of a study on the implications of long-term climate change for energy, agriculture and forestry in Quebec, selected due to their economic importance. In the energy sector, the hydro-electric power generating potential of the James Bay area was examined, as well as the projected interior space heating requirements in the southern part of the province. An increase in the net basin supply of from 7%-20% for 3 drainage

basins within the James Bay area was postulated, giving a potential increase in generating capacity of about 9.3 x 10-12th W/h for the 3 basins combined. Significant decreases in heating degree-days for Montreal (25%) and Quebec City (35%) were possible. In the forestry sector, the potential for displacement of tree communities and changes in tree growth rates were examined. These changes could lead to northward displacement of major forest ecosystems, drastic decreases in tundra forest area, and a potential decrease in boreal forest area of about 20% but with better growth rate. In the agriculture sector, the projected effects on agroclimatic resource potential and on crop productivity led to a substantial increase in the length of the growing season, a sharp increase in growing degree-days in all regions (40%-105%) and increased cultivation of grapes and apples. The crops examined included grain and fodder corn, soybeans, potatoes, spring wheat, beans, sorghum, barley, oats, rape-seed sun flowers, and orchard crops such as grapes and apples. Preliminary economic impact assessments involving simple cost-benefit analyses were performed. 4 figs., 2 tabs.

22508 (N–90-13618) **Computational solution of chemistry problems. Final report, period ending 30 June 1988.** Ake, R.L. Old Dominion Univ., Norfolk, VA (USA). Nov 1989. 26p. (NASA-CR–186000;NAS–1.26:186000). Available from NTIS, PC A03/MF A01.

AB initio quantum chemical techniques have been used to investigate weakly bound complexes of H2O and SO2. An energy gradient program was used to locate stable structures for the H2O, SO2 complexes, and SCF calculations were carried out to determine the binding energies of complexes with multiple water molecules. A 4-31G basis set was used for most potential energy searches. More accurate basis sets including a generally contracted basis set with d orbitals on the sulfur were used for geometry and binding energy verification. For single water complexes, five different stable geometries were located with binding energies between 4 and 11 Kcal mol(-1), suggesting a binding shell for H2O around SO2 and a mechanism for the formation of an SO2-containing water droplet. Calculations on one of the complexes utilizing a larger double zeta basis and d functions on the sulfur atom lead to adjusted binding energies in the range 3 to 8 Kcal mol(-1). Very little charge transfer between SO2 and H2O was present. Addition of more than one H2O was found to be energetically favorable although the addition of the fourth water in certain geometries did not increase the stability of the complex. An alternative mechanism for the tropospheric gas phase production of acid rain is suggested.

22509 (ORNL/CDIAC–30) **United States Historical Climatology Network (HCN) serial temperature and precipitation data.** Boden, T.A. (ed.); Karl, T.R.; Williams, C.N. Jr.; Quinlan, F.T. Oak Ridge National Lab., TN (USA). Jan 1990. 381p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. (NDP–019/R1). Order Number DE90008029. Available from NTIS, PC E17/MF E08 - OSTI; GPO Dep.

Includes 28 microfiche supplements; Environmental Sciences Division Publication No. 3404.

This document describes a data base containing monthly temperature and precipitation data for 1219 US stations. This network of stations, known as the Historical Climatology Network (HCN), and the resulting data base were compiled by the National Climatic Data Center. These data represent the best available data from the United States for analyzing long-term climate trends on a regional scale and may be used for studies attempting to determine the climatic impacts of increased concentrations of greenhouse gases. Unlike most data sets that have been used in past climate studies, these station data have been adjusted to remove biases introduced by station moves, instrument changes, time-of-observation differences, and urbanization effects. These monthly data, along with supporting data, including station inventories, station histories, temperature corrections for time-of-observation bias, and data quality assessments, are available free of charge as a numeric data package (NDP) from the Carbon Dioxide Information Analysis Center. The NDP consists of this document and magnetic tapes containing machine-readable data files, supporting data files, a descriptive file, and computer access codes. This document describes how the stations in the HCN were selected and how the data were processed, defines limitations and restrictions of the data, describes the format and contents of the magnetic tape, and provides reprints of literature that discuss the editing and adjusting techniques used for the HCN. 16 refs., 1 fig., 27 tabs.

22510 (PB–90-130105/XAB) **Investigation of the determination of respirable quartz on filter media using Fourier transform infrared spectrophotometry.** Lorberau, C. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Div. of Physical Sciences and Engineering. 29 Sep 1989. 73p. Available from NTIS, PC A04/MF A01.

The use of Fourier transform infrared spectrophotometry for the determination of quartz in respirable dust directly on filter media was investigated. Fifteen different 25-mm filters which might be used in a respirable dust sampler were examined. With the best of these, the limit of detection in practical operating conditions (three times the standard deviation of the blank) was estimated to be 3 micrograms with linearity in excess of 1 mg. The spatial inhomogeneity of the filter background appears to be a limiting factor to the sensitivity. Procedures were devised to correct for the filter background and the absorbance of relatively non-structured interferences, such as coal dust. In addition, two methods to correct for the interference of the overlapping absorbance bands of other minerals (kaolinite, cristobalite) with those of quartz were also studied. Scaled spectral subtraction of reference spectra of the interferences provided results that did not differ significantly from those which were obtained by a more traditional approach. Both methods overcorrected for the presence of the interference. The absorbance signal per unit weight of quartz was observed to be influenced by particle size within the respirable range.

22511 (PB–90-130352/XAB) **National air quality and emissions trends report, 1987.** Curran, T.C.; Faoro, R.B.; Fitz-Simons, T.; Frank, N.H.; Hunt, W.F. Environmental Protection Agency, Research Triangle Park, NC (USA). Office of Air Quality Planning and Standards. 1987. 152p. (EPA–450/4-89/001). Available from NTIS, PC A08/MF A01.

See also report for 1986, PB–88-172473.

This report presents national and regional trends in air quality from 1978 through 1987 for total suspended particulate, sulfur dioxide, carbon monoxide, nitrogen dioxide, ozone, and lead. Air-pollution trends were also examined for the 5-year period (1983-87). Both national and regional trends in each of these pollutants are examined. National air-quality trends are also presented for both the National Air Monitoring Sites (NAMS) and other site categories. In addition to ambient air quality, trends are also presented for annual nationwide emissions. These emissions are estimated using the best available engineering calculations; the ambient levels presented are averages of direct measurements.

22512 (PB–90-130451/XAB) **Catching our breath: Next steps for reducing urban ozone.** Office of Technology Assessment (U.S. Congress), Washington, DC (USA). Jul 1989. 249p. (OTA-O–412). Available from NTIS, PC A11/MF A02.

Also available from Supt. of Docs.; Library of Congress catalog card No. 89-600715.

Contents include: summary; ozone and the Clean Air Act; health effects of ozone; effects of ozone on crops and forests; lowering ozone; effect of controlling volatile organic compounds and nitrogen oxides; controlling emissions of volatile organic compounds; new opportunities for controlling ozone; and policy options.

22513 (PB–90-130832/XAB) **Analysis of state and federal sulfur dioxide emission regulations for combustion sources (revised).** Vitas, J.B.; Pandullo, R.F.; Pickett, D. Radian Corp., Research Triangle Park, NC (USA). Sep 1989. 433p. Available from NTIS, PC A19/MF A03.

See also PB–83-179838.

State implementation plan (SIP) regulations and Federal new source performance standards (NSPS) pertaining to sulfur dioxide (SO2) emissions from fuel-combustion sources have been compiled and summarized in the report. State regulations which were submitted to the Environmental Protection Agency (EPA) and have been approved as part of the SIP as of December 31, 1988 are included. The source categories to which the regulations presented herein apply are broadly defined as indirect and direct heat exchangers, and primary steam generators (boilers). The report will

serve as a quick reference for estimating SO2 emission rates, assessing ranges of SO2 control, and quantifying the relative stringency of emission limits. Users are cautioned, however, to contact the appropriate State and/or local air pollution control agency and EPA Regional Office to verify the specific SO2 emission limit that is applicable to an individual source.

22514 (PB–90-131335/XAB) **Walk-through survey report, control technology support for sensor at Ingersoll-Rand Company, Foundry Division, Phillipsburg, New Jersey, March 2, 1989.** O'Brien, D.; Froehlich, P.; Hall, R. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Aug 1989. 25p. (CT–171-17A). Available from NTIS, PC A03/MF A01.

A walk-through study was made of the Ingersoll-Rand Company, Phillipsburg, New Jersey to evaluate the facility for an in depth study in which potential worker exposures to silica containing dusts would be measured and a study made of work practices and administration control programs being used to reduce these dust exposures. The firm has operated both gray iron and steel foundries at the site, but at this point the gray iron foundry had closed. The facility was a captive foundry producing steel and stainless steel castings for the parent company. Five induction furnaces were used to melt the scrap. The foundry produced molds using an alkyd/oil molding system. Casting appendages were removed by either an air or oxygen torch in one of two ventilated booths. Grinding of bronze castings was performed in an adjacent booth. This report recommends the modification of the semi-automatic system to allow all molds to be isolated once they are poured, and substitute of olivine sand for silica to reduce the incidence of silicosis. A potential exposure of hand grinding operators will be lessened if the castings are as clean as possible before grinding. Improvements in the local exhaust ventilation system and in the general ventilation system are also recommended.

22515 (PB–90-131343/XAB) **Walk-through survey report, control technology support for sensor at General Foundry Company, Flagtown, New Jersey, March 1, 1989.** O'Brien, D.M.; Froehlich, P.A.; Hall, R.M. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Sep 1989. 26p. (CT–171-16A). Available from NTIS, PC A03/MF A01.

A walk-through survey was conducted at the General Foundry Company, Flagtown, New Jersey to evaluate control methods used to reduce worker risk of silicosis and assist in developing similar programs for other similar factories. The facility employed 20-22 hourly and eight salaried persons, one shift, 6 days a week. The facility was a job shop producing ferrous castings. Purchased scrap and graphite were stored inside the foundry adjacent to the furnace area. Two induction furnaces melted the scrap. Molds were produced in both green sand and furan no-bake molding systems. After shakeout and cooling, castings were cleaned by steel shot in either a swing table or tumble blast abrasive cleaning cabinet. Potential hazards included exposure to crystalline silica, metals, decomposition products, carbon monoxide, alcohols, formaldehyde, hydrogen cyanide, phenol and sulfur compounds. Engineering control methods included the substitution of front-end loader sand handling with a large foundry grade vacuum system exhausting through appropriate filters to the outdoors. The use of ventilation to effect control was virtually impossible. For silica, olivine could be substituted in this foundry and this would reduce the incidence of silicosis. Improving local-exhaust ventilation and general ventilation and using good work practices are recommended.

22516 (PB–90-131350/XAB) **Walk-through survey report, control technology support for sensor at Alloy-Tech, Inc., Delran, New Jersey, February 27, 1989.** O'Brien, D.; Froehlich, P.; Hall, R. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Aug 1989. 23p. (ECTB–171-15A). Available from NTIS, PC A03/MF A01.

A walk through study was made of Alloy-Tech, Inc., Delran, New Jersey for the purpose of evaluating this facility for an in-depth study in which potential worker exposures to silica containing dusts would be measured and a study made of work practices and administration control programs being used to reduce these dust exposures. This facility produced ferrous castings to order in alloys ranging from iron to stainless steel. Scrap was melted in induction furnaces. Green sand molds and no bake molds were both used at the site. Castings were cleaned by steel shot in an abrasive blasting cabinet. Personal protective equipment included safety shoes, safety glasses, hard hats and ear plugs. The highest silica exposures in the facility occurred during the handling of the molding sands and during cleaning of the castings. The report recommends the substitution of broom and shovel sand handling with large foundry grade vacuum systems to lower exposures and increase productivity. The substitution of olivine for foundry sand is also suggested. Shakeout, sand screening and sand mulling operations will also benefit from the substitution of olivine. Some modifications in equipment are suggested along with upgrading in the ventilation systems.

22517 (PB–90-131376/XAB) **Heart-disease mortality among bridge and tunnel officers exposed to carbon monoxide.** Stern, F.B.; Halperin, W.E.; Hornung, R.W.; Ringenburg, V.L.; McCammon, C.S. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Div. of Surveillance, Hazard Evaluation and Field Studies. 1989. 38p. Available from NTIS, PC A03/MF A01.

A retrospective study was conducted of 5529 New York City bridge and tunnel officers to determine the effect of occupational exposure to carbon monoxide (CO) with specific reference to heart disease mortality. Continuous monitoring of CO within the tunnels operated by the Triborough Bridge and Tunnel Authority began in 1940. In 1961 the 24 hour average CO concentrations inside the tunnels were 53 parts per million (ppm) in the summer and 49ppm in the winter with peaks of 200 to 300ppm in the summer and 100 to 200ppm in the winter. Monitoring in 1970 indicated CO levels of 63ppm in tunnel toll booths and 13ppm in bridge toll booths. In 1977 ventilation equipment which had been installed was linked to continuously reading CO monitors. Peak 1981 CO exposures in the traffic lanes of both the tunnel and bridge and on the tunnel catwalk were often greater than 100ppm and sometimes surpassed 400ppm. Arteriosclerotic heart disease (ASHD) was the cause of death in 61 former tunnel officers as compared to the expected number of 45. A Cox proportional hazards model was used to compare the risk of mortality from ASHD among tunnel officers to the less exposed bridge officers. While there was a significant association between exposure and age, no association of ASHD was noted with length of exposure.

22518 (PB–90-131434/XAB) **Alternative control technology document: Ethylene oxide sterilization/fumigation operations.** Midwest Research Inst., Cary, NC (USA). Mar 1989. 100p. Available from NTIS, PC A05/MF A01.

This report presents technical information that State and local agencies can use to develop strategies for reducing VOC (i.e., EO) emissions for sterilization/fumigation facilities. The information in the document will allow planners to identify available control alternatives and evaluate the VOC reduction and cost of implementing controls. The document provides information on sterilization/fumigation processes, EO (ethylene oxide) emissions, and emission reductions, and cost associated with the application of control units. Section 2.0 presents a summary of the findings of the study. Section 3.0 provides a description of sterilization/fumigation facility operations and emission sources. Section 4.0 provides a description of alternative control techniques for the reduction of ethylene oxide emissions. Section 5.0 presents a cost analysis that includes a methodology for computing annualized equipment and operating costs. A list of contacts at various Federal agencies who are knowledgeable about sterilization/fumigation processes is presented in Appendix A.

22519 (PB–90-131442/XAB) **Evaluation of emission-control devices at waterboard plants. Final report.** Vaught, C.C. Midwest Research Inst., Cary, NC (USA). Oct 1989. 101p. Available from NTIS, PC A06/MF A01.

The document discusses emissions from wood-chip dryers and the candidate control devices that should be considered in a best available control technology analysis. Specifically, the document characterizes wood-chip dryer effluents and presents a general description, pollutant removal efficiencies, factors affecting performance, and cost for the wet electrostatic precipitator and the electrified filter bed. The document also presents information on controlling formaldehyde emissions from the press vents.

22520 (PB–90-131459/XAB) **NATICH (National Air Toxics Information Clearinghouse) data base report on state, local, and EPA (Environmental Protection Agency) air toxics activities. Interim report.** Radian Corp., Austin, TX (USA). Jul 1989. 745p. Available from NTIS, PC A99/MF A04.

This report disseminates information provided to the NATICH data base by State and local air agencies and EPA on their air-toxics activities. It both updates and extends (in new tables) the information in the first six reports. The report includes a listing of State and local agencies that have provided information to the clearinghouse, air-toxics contacts, regulatory program information, acceptable ambient concentration guidelines or standards and the bases of those guidelines/standards, pollutant research information, methods development activities, permitting data, source testing data, ambient monitoring information, emissions inventory information, and selected EPA risk-assessment information. Because of the large volume of data that now resides in the data base, the document reports only a subset of permitting and source data.

22521 (PB–90-131491/XAB) **Environmental Radiation Data: Report 53, January-March 1988. Quarterly report.** Environmental Protection Agency, Montgomery, AL (USA). Eastern Environmental Radiation Facility. Sep 1988. 45p. (EPA–520/5-88/057). Available from NTIS, PC A03/MF A01.

See also PB–89-135958.

Environmental Radiation Data (ERD) contains data from the Environmental Radiation Ambients Monitoring System (ERAMS). Data from similar networks operated by contributing States, Canada, Mexico, and the Pan American Health Organization are reported in the ERD when available. The ERAMS is comprised of nationwide sampling stations that provide air, surface, and drinking water and milk samples from which environmental radiation levels are derived. Sampling locations are selected to provide optimal population coverage while functioning to monitor fallout from nuclear devices and other forms of radioactive contamination of the environment.

22522 (PB–90-131509/XAB) **Environmental Radiation Data: Report 54, April-June 1988. Quarterly report.** Environmental Protection Agency, Montgomery, AL (USA). Eastern Environmental Radiation Facility. Dec 1988. 49p. (EPA–520/5-88/058). Available from NTIS, PC A03/MF A01.

See also PB–90-131491.

22523 (PB–90-131863/XAB) **NIOSH (National Institute for Occupational Safety and Health) testimony on cotton dust before the House Committee on Education and Labor, Subcommittee on Labor Standards, by James A. Merchant, May 16, 1979.** National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). 16 May 1979. 12p. Available from NTIS, PC A03/MF A01.

The testimony summarized information available on respiratory disease arising from exposure to cotton dust which will appear in a comprehensive study the National Institute for Occupational Safety and Health (NIOSH) has undertaken together with the Department of Labor at the request of Congress. The NIOSH portion of the study involved a detailed description of methods of epidemiological and environmental investigation of occupational respiratory disease, assessment of impairment and disability and a series of chapters on specific categories of occupationally induced respiratory disease. In this testimony, specific information was imparted regarding byssinosis. Topics included: byssinosis; the number of exposed workers; etiological agents; Monday morning chest tightness; chronic effects; epidemiology; disability; and cigarette smoking as a risk factor. Elements important to standards for compensation for disability from cotton-dust exposure were suggested.

22524 (PB–90-132341/XAB) **NAPAP (National Acid Precipitation Assessment Program) emissions inventory (version 2): Development of the national utility reference file, 1985. Final report, January-September 1989.** Wagner, J.K.; Rothschild, S.S.; Istvan, D.A. Pechan (E.H.) and Associates, Inc., Springfield, VA (USA). Nov 1989. 193p. Available from NTIS, PC A09/MF A02.

For system on magnetic tape, see PB–90-500992. For system on diskette, see PB–90-501008.

The report gives results of a project conducted to create a file containing comprehensive data on all electric utilities in the US. The National Acid Precipitation Assessment Program's (NAPAP's) emissions inventory activities focus on the estimation of emissions from pollutants that contribute to acid deposition. Electric utilities, which emit a large share of total acid deposition precursor emissions, are important for modeling analyses. Data reported by states to the National Emissions Data System (NEDS) for the 1985 NAPAP Emissions Inventory and data reported to the U.S. Department of Energy (DOE) on EIA Form 759, EIA Form 767, FERC Form 423, and the Integrated Data Base System (IDBS) were matched and combined. The resulting 1985 National Utility Reference File (NURF) contains detailed unit level data for nearly 10,000 electricity generating plants.

22525 (PB–90-132663/XAB) **Distribution and variability of precipitation chemistry in the conterminous United States, January through December 1983. Open file report.** Rinella, J.F.; Miller, T.L. Geological Survey, Portland, OR (USA). Water Resources Div. 1988. 251p. (USGS/OFR–87-558). Available from NTIS, PC A12/MF A02.

Analyses of atmospheric precipitation samples, collected during the 1983 calendar year from 109 National Trends Network sites in the United States, are presented. The sites were grouped into six geographical regions based on the chemical composition of the samples. Precipitation chemistry in these regions was influenced by proximity to (1) oceans, (2) major industrial and fossil-fuel consuming areas, and (3) major agricultural and livestock areas. Frequency distributions of ionic composition, determined on 10 chemical constituents and on precipitation quantities for each site, showed wide variations in chemical concentrations and precipitation quantities from site to site. Of the 109 sites, 55 had data coverage for the year sufficient to characterize precipitation-quality patterns on a nationwide basis.

22526 (PB–90-132689/XAB) **Radon fundamentals and the effectiveness of coatings in reducing soil gas flow through block basement walls. Report for May 1988-March 1989.** Ruppersberger, J.S. Environmental Protection Agency, Research Triangle Park, NC (USA). Air and Energy Engineering Research Lab. 1989. 10p. (EPA–600/D-89/205). Available from NTIS, PC A02/MF A01.

This paper gives results of an evaluation of six different coatings in specially designed chambers built around 1.5 sq m concrete-block-wall sections. Data were collected over a pressure range of 1-12 Pa with flows from < 0.01 to 50 standard liters/minute (SLPM). The six coatings were a water-based catalyzed epoxy paint, an elastomeric paint, a cementaceous block filler, a surface bonding cement, a polysulfide vinyl acrylic paint, and a latex paint. A major preliminary finding is that all six coatings proved to be highly effective (98-plus %) when enough material is carefully applied. This large variation in a small sampling of blocks is significant not only in the potential impact on coating performance but also, more significantly, that specification of blocks with low air permeability for new construction substructures could greatly reduce soil gas entry, even if left uncoated.

22527 (PB–90-132705/XAB) **Gypsum-wallboard formaldehyde-sorption model.** Silberstein, S. National Inst. of Standards and Technology (NEL), Gaithersburg, MD (USA). Center for Building Technology. Nov 1989. 22p. (NISTIR–89/4028). Available from NTIS, PC A03/MF A01.

Gypsum wallboard was shown to absorb formaldehyde in a prototype house and in a measuring chamber, as reported previously by researchers at Oak Ridge National Laboratory (ORNL). Also as reported previously, formaldehyde concentrations attained equilibrium in two phases in response to a change in the air exchange rate or to the removal of the formaldehyde source. A rapid initial

phase was followed by a slow phase lasting several days. A formaldehyde sorption model that accounts for the biphasic concentration pattern is presented here. Experiments for testing the predictability of the model are proposed.

22528 (PB–90-132903/XAB) **Structural changes during the decomposition of calcium hydroxide. Report for October 1988-July 1989.** Jozewicz, W.; Kirchgessner, D.A.; Gullett, B.K. Acurex Corp., Research Triangle Park, NC (USA). Environmental Systems Div. c 1989. 18p. Available from NTIS, PC A03/MF A01.

The paper discusses the production of calcium hydroxides with surface areas of 6-74 sq m/g, in an attempt to develop more reactive sorbents for SO_2 capture during furnace injection. It was found that adding alcohol to the water of hydration yielded hydroxides with surface areas up to 40 sq m/g. The sorbents were produced using double hydration and a mixture of water and methyl alcohol. When these sorbents were injected into the boiler, however, only marginal increases in SO2 capture were observed. The purpose of the research was to monitor structural changes in these sorbents during calcination in order to determine the reason for their relatively poor performance. For a given calcine and fixed conditions of calcination, the surface area decreased and median pore size increased with decreasing particle size in the 1.2-7.5 micrometer size range. This suggests that sintering advances more quickly in fine particles. For sorbents described here and using one precursor limestone, a correlation could be found between structural properties of Ca(OH)2 and nascent CaO. Increased surface area of Ca(OH)2 led to higher surface area of CaO after calcination at fixed conditions. The theoretical existence of an optimum combination of surface area and porosity of CaO was verified.

22529 (PB–90-139965/XAB) **Health assessment for Juncos Landfill, Juncos, Puerto Rico, Region 2. CERCLIS No. PRD980512362. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 23 Apr 1984. 11p. Available from NTIS, PC A03/MF A01.

The Juncos Landfill near Juncos, Puerto Rico was operated for 20 years until 1977. In 1982, preliminary investigation by EPA Region II revealed that the most extensive contaminant was elemental mercury, spilled from and contained within large numbers of broken thermometers dumped at the landfill. Ambient air monitoring performed February 10, 1983 by the Region II Field Investigation Team showed that several organic solvents were present in the air, both on- and off-site, in addition to the mercury. As a result of these studies, the landfill was placed on the National Priority List. Subsurface sampling of the dumpsite to determine if other pollutants are present has not been performed. The known pollutant of concern at the landfill is mercury. In the present situation, this metal can create health risks in the forms of mercury vapor (elemental) and methylmercury (organic).

22530 (PB–90-500968/XAB) **Development of the National Acid Precipitation Assessment Program (NAPAP) Anthropogenic Emissions Inventory, 1985: Annual point sources, Version 1. Data file.** Mobley, J.D.; Saeger, M. Environmental Protection Agency, Research Triangle Park, NC (USA). Air and Energy Engineering Research Lab. 1985. mag ta Available from NTISCP T03.

See also PB–88-137138, PB–88-137302, and PB–88-137179. Source tape is in the ASCII character set. This restricts preparation to 9 track, one-half inch tape only. Identify recording mode by specifying density only. For price at 6250 bpi density, call NTIS Computer Products. Price includes documentation, PB–88-132121.

This file contains Annual Emissions and Facility Data for point sources of air pollutants included in the 1985 NAPAP Emissions Inventory Version 1. The inventory spans the 48 contiguous U.S. states and 10 Canadian provinces, providing detailed point-source data for over 14,000 plants and area-source information by source category for 3,070 U.S. counties. Canadian area source data are reported at the province level. Summaries of emissions data are presented at various levels of aggregation including nation, EPA region, state/province, and source category. Emissions data are also analyzed by plant size, stack height, and general source type, and emissions variations are examined on seasonal and daily bases.

22531 (PB–90-500976/XAB) **Development of the National Acid Precipitation Assessment Program (NAPAP) Anthropogenic Emissions Inventory, 1985: Annual area source county level fuel use and activity levels, Version 1. Data file.** Mobley, J.D.; Saeger, M. Environmental Protection Agency, Research Triangle Park, NC (USA). Air and Energy Engineering Research Lab. 1985. mag ta Available from NTISCP T02.

See also PB–88-137138, PB–88-137302, and PB–88-137179. Source tape is in the ASCII character set. This restricts preparation to 9 track, one-half inch tape only. Identify recording mode by specifying density only. For price at 6250 bpi density, call NTIS Computer Products. Price includes documentation, PB–88-132121.

The file contains county level activity and allocation data used to develop the 1985 NAPAP Area Source Emissions Inventory Version 1. The inventory spans the 48 contiguous U.S. states and 10 Canadian provinces, providing detailed point source data for over 14,000 plants and area source information by source category for 3,070 U.S. counties. Canadian area source data are reported at the province level. 22533 (PB–90-500992/XAB) **Development of the National Acid Precipitation Assessment Program (NAPAP) National Utility Reference File (NURF) emissions inventory, 1985, Version 2. Data file.** Wagner, J.K.; Rothschild, S.S. Environmental Protection Agency, Research Triangle Park, NC (USA). Air and Energy Engineering Research Lab. 1985. mag ta Available from NTISCP T02.

See also PB–88-137153 and PB–88-137138. Source tape is in the EBCDIC character set. This restricts preparation to 9 track, one-half inch tape only. Identify recording mode by specifying density only. For price at 6250 bpi density, call NTIS Computer Products. Price includes documentation, PB–90-132341.

The EBCDIC file contains unit-level data for every existing and planned electric generating unit in the U.S. The data represent the year 1985. The data were obtained from EPA and DOE data bases and merged into a single comprehensive data base for all electric utilities. Categories of data included are identification and location information; unit operation characteristics (e.g., prime mover, capacity, bottom type, firing type); unit lifetime data; fuel consumption and quality data; regulatory information; emissions and pollution control data; and ownership information. A preamble to the file provides file layout information.

22534 (PB–90-855230/XAB) **Indoor radon pollution: Control and mitigation. June 1978-December 1989 (Citations from the NTIS data base). Report for June 1978-December 1989.** National Technical Information Service, Springfield, VA (USA). Jan 1990. 79p. Available from NTISPC N01/MF N01.

This bibliography contains citations concerning the control and mitigation of radon pollution in homes and commercial buildings. Citations cover radon transport studies in buildings and soils, remedial action proposals on contaminated buildings, soil venting, building ventilation, sealants, filtration systems, water degassing, reduction of radon sources in building materials, and evaluation of existing radon mitigation programs including their cost effectiveness. Analysis and detection of radon and radon toxicity are covered in separate published bibliographies. (Contains 129 citations fully indexed and including a title list.)

22535 (PB–90-856865/XAB) **Remote sensing applied to environmental-pollution detection and management. July 1987-January 1990 (Citations from the NTIS data base). Report for July 1987-January 1990.** National Technical Information Service, Springfield, VA (USA). Jan 1990. 57p. Available from NTISPC N01/MF N01.

Supersedes PB–89-855399.

This bibliography contains citations concerning the utilization of remote sensing techniques and equipment to study air- and water-pollution problems. Topics include the use of aerial photographs, various radar techniques, and spaceborne photography to study oil spills, ocean-dumping sites, plume dispersions, and pollution problems in estuaries. Data interpretation and processing techniques are also discussed. (This updated bibliography contains 84 citations, 30 of which are new entries to the previous edition.)

22536 (PB–90-857012/XAB) **Air-pollution sampling of particles. February 1981-April 1986 (Citations from the NTIS data base). Report for February 1981-April 1986.** National Technical Information Service, Springfield, VA (USA). Jan 1990. 101p. Available from NTISPC N01/MF N01.

See also PB–90-857020.

This bibliography contains citations concerning the techniques of sampling particles in the earth's atmosphere. Sampling procedures, sampler design and performance, site selection, sampling networks, and meteorological effects are discussed. (This updated bibliography contains 199 citations, none of which are new entries to the previous edition.)

22537 (PB–90-857020/XAB) **Air-pollution sampling of particles. May 1986-January 1990 (Citations from the NTIS data base). Report for May 1986-January 1990.** National Technical Information Service, Springfield, VA (USA). Jan 1990. 93p. Available from NTISPC N01/MF N01.

Supersedes PB–86-867496. See also PB–90-857012.

This bibliography contains citations concerning the techniques of sampling particles in the Earth's atmosphere. Sampling procedures, sampler design and performance, site selection, sampling networks, and meteorological effects are discussed. (This updated bibliography contains 158 citations, all of which are new entries to the previous edition.)

22538 (PNL-SA–17905) **Global warming: A Northwest perspective: Proceedings.** Scott, M.J.; Counts, C.A. (eds.). Pacific Northwest Lab., Richland, WA (USA). Feb 1990. 103p. Sponsored by U.S. DOE Energy Research; Northwest Power Planning Council; Oregon Department of Energy; Washington State Energy Office. DOE Contract AC06-76RL01830. (CONF-8902158–1: Conference on global warming: a Northwest perspective, Olympia, WA (USA), 9 Feb 1989). Order Number DE90008140. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

The Northwest Power Planning Council convened a symposium in Olympia, Washington, on the subject of global climate change ("the greenhouse effect") and its potential for affecting the Pacific Northwest. The symposium was organized in response to a need by the Power Council to understand global climate change and its potential impacts on resource planning and fish and wildlife planning for the region, as well as a need to understand national policy developing toward climate change and the Pacific Northwest's role in it. 40 figs., 15 tabs.

22539 (SAND–90-8206) **1988 Annual site environmental report, Sandia National Laboratories, Livermore, California.** Siegfriedt, K.F. Sandia National Labs., Livermore, CA (USA). May 1989. 20p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DR00789. Order Number DE90008006. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Sandia National Laboratories at Livermore, California, is located 65 km (50 miles) southeast of San Francisco midway between the Pacific Ocean and the San Joaquin Valley. Sandia conducts various research activities related to Department of Energy interests which have the potential for release of hazardous materials or radionuclides to the environment. A strict environmental control program places maximum emphasis on limiting releases. The environmental monitoring program conducted by Lawrence Livermore National Laboratory and augmented by Sandia is designed to measure the performance of the environmental controls. The program includes analysis of air, water, soil, vegetation, sewer effluent, ground water, and foodstuffs for various toxic, hazardous, or radioactive materials. Based on these studies, the releases of materials of concern at Sandia during 1988 were well below applicable Department of Energy standards and in compliance with state and federal laws and regulations. 11 refs., 2 figs., 12 tabs.

22540 (UCRL–21295) **Status of surface processes in the LLNL zonally symmetric model.** Gleckler, P.J. (California Univ., Davis, CA (USA)). Lawrence Livermore National Lab., CA (USA); California Univ., Davis, CA (USA). 30 Sep 1989. 41p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. Order Number DE90007284. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A surface package has been developed for use in the LLNL zonally symmetric model (ZSM). Surface energy balances are computed for both land and ocean. The ocean is modeled as a well-mixed slab, the land as a single layer with constant thermal conductivity. A land surface moisture budget includes rain, evaporation, sublimation, snowfall, snowmelt and runoff. There is a highly simplified parameterization of surface albedo for freezing oceans and snow covered land. Land and sea air is 'instantly mixed' by averaging pertinent land and sea surface variables (weighted by their respective areas in each zone) before use in subsequent atmospheric computations. Initial tests have demonstrated that the surface package is working properly. It has been demonstrated that the model produces a reasonable 'annually averaged' climate. There are some aspects of ZSM which need to be improved, most notably that of cloud cover. The next stage in the development is to test the model in seasonal mode. An improved treatment of surface albedo is currently being coded. When ZSM has been tested in seasonal mode, a sea ice routine will be added to the surface package. There are also plans to implement a method which accounts for the interaction between land and sea air. 5 refs., 15 figs.

Contract BMU St.Sch. 1004. Available from GRM Werbeberatung - Werbemittlung - PR, Eggenstein-Leopoldshafen, (Germany, F.R.). Available from GRM Werbeberatung - Werbemittlung - PR, Eggenstein-Leopoldshafen, (Germany, F.R.).

The basis for the tests was provided by the experimental data published on the air transport of radioactive iodine and by the measurement data on the concentration of I-131 in the air, in pastoral vegetation and in milk from April 26 to the end of June 1986, as a

consequence of the Chernobyl reactor accident for the Federal Republic of Germany. The transition from air to pastoral vegetation, from pastoral vegetation to milk and from air to milk was calculated. Besides the direct determination of these values from the measurement results, the transition factors were also derived from the data for the individual parameters fall-out rate, vegetation density, vegetation half-life, the transfer factor fodder/milk, and fodder quantity for cows. The data used for the analyses include results of investigations conducted after nuclear weapons tests and following emissions of radioactive iodine from nuclear power stations and reprocessing plants, as well as the data obtained in the framework of the program for Controlled Environmental Radioiodine Tests (CERT program). (orig./HP).

22542 (BR–85(7.26)) **The ecology of hydric hammocks: A community profile.** Vince, S.W.; Humphrey, S.R.; Simons, R.W. Fish and Wildlife Service, Washington, DC (USA); Florida Museum of Natural History, Gainesville, FL (USA). Sep 1989. 82p. Sponsored by U.S. Department of the Interior. Available from NTIS, PC A05/MF A01; OSTI - US Fish and Wildlife Service, 18th and C Streets, N.W., Mail Stop 1111, Arlington Square Building, Washington, DC 20240.

This publication describes the nature and dynamics of a type of forested wetland called hydric hammock. Hydric hammock has not been carefully defined or studied, and it often is ignored or lumped with other mixed hardwood forests. Hydric hammock occurs at low elevations along the gulf coast of Florida from Aripeka to St. Marks and at various inland sites in Florida. The largest contiguous tracts occur along the gulf coast and the St. Johns River. Sites typically are gentle slopes between mesic hammock or pine flatwoods and river swamp, wet prairie, or marsh. Hydric hammocks occur on soils that are poorly drained or have high water tables, and occasional flooding saturates the soils long enough to restrict or modify species composition. Hydric hammocks typically contain live and swamp laurel oaks (*Quercus virginiana* and *Quercus laurifolia*), cabbage palm (*Sabal palmetto*), southern red-cedar (*Juniperus silicicola*), sweetgum (*Liquidambar styraciflua*), and hornbeam (*Carpinus caroliniana*). Hydric hammocks lack certain tree species while sharing others with both upslope mesic forests and downslope swamp forests. The vertebrate fauna contains no unique species but has a high diversity of species and high abundance of selected species. Hydric hammocks are particularly important habitat for game species and for overwintering passerine birds. 148 refs., 40 figs., 12 tabs.

22543 (DOE/ID–22085) **Selected quality assurance data for water samples collected by the US Geological Survey, Idaho National Engineering Laboratory, Idaho, 1980 to 1988.** Wegner, S.J. Geological Survey, Idaho Falls, ID (USA). Oct 1989. 91p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (USGS/WRIR–89-4168). Order Number DE90006967. Available from NTIS, PC A05/MF A01; OSTI; INIS; USGS-OFR, U.S.G.S. Open File Service, Box 25425-Denver Federal Center, Denver, CO 80225; GPO Dep.

Multiple water samples from 115 wells and 3 surface-water sites were collected between 1980 and 1988 for the ongoing quality assurance program at the Idaho National Engineering Laboratory. The reported results from the six laboratories involved were analyzed for agreement using descriptive statistics. The analytical constituents and properties included: tritium, plutonium-238, plutonium-239, -240 (undivided), strontium-90, americium-241, cesium-137, total dissolved chromium, selected dissolved trace metals, sodium, chloride, nitrate, selected purgeable organic compounds, and specific conductance. Agreement could not be calculated for trace metals, some nitrates, purgeable organic compounds, and blank-sample analyses because analytical uncertainties were not consistently reported. However, differences between results for most of these data were calculated. The blank samples were not analyzed for difference. The laboratory results analyzed using descriptive statistics showed a median agreement of 95 percent between all useable data pairs. 13 refs., 4 figs., 24 tabs.

22544 (DOE/NP–0003) **Implementation plan for the new production reactor capacity environmental impact statement.** USDOE Office of Environment, Washington, DC (USA). Office of New Production Reactors. Dec 1989. 62p. Sponsored by U.S. DOE Nuclear Energy. Order Number DE90007646. Available from NTIS, PC A04/MF A01; OSTI; INIS; GPO Dep.

The US Department of Energy (DOE) proposed to site, construct, and operate new production reactor (NPR) capacity intended primarily to produce tritium and secondarily to produce plutonium for the US nuclear weapons program. DOE studies show that this new capacity is needed to ensure reliable maintenance of the nation's nuclear weapons stockpile. It also is essential that these necessary nuclear materials be produced in a safe and environmentally sound manner. The DOE has determined that this proposed action constitutes a major federal action that may significantly affect the quality of the human environment; therefore, the DOE will prepare an environmental impact statement (EIS) to assess the potential impacts of the proposed action and reasonable alternatives on the human and natural environment. The EIS will be prepared in accordance with the National Environmental Policy Act of 1969, as implemented in regulations promulgated by the Council on Environmental Quality (CEQ). This EIS implementation plan (IP) includes a description of the proposed action, descriptions of alternatives, a summary of EIS assumptions, a list of environmental issues to be considered in the EIS (including those identified during public scoping activities), a list of proposed agency consultations, a schedule for EIS preparation and related activities, and an annotated outline for the EIS. It is the Department's intent that the EIS on the NPR capacity will serve as the programmatic National Environmental Policy Act (NEPA) review of modernization of DOE defense nuclear materials production of tritium and plutonium. The Department is currently developing a NEPA compliance strategy for modernization of the remainder of the nuclear weapons production complex, which will reference the EIS on NPR capacity. 7 refs., 8 tabs.

22545 (JAERI-M–89-144) **Migration behavior of radionuclide in soil layer of final storage site: Radionuclide migration test in aerated soil layer by radioactive contaminated water.** Yamamoto, Tadatoshi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Takebe, Shinichi; Ogawa, Hiromichi; Tanaka, Tadao; Mukai, Masayuki; Komiya, Tomokazu; Yokomoto, Seiichi; Wadachi, Yoshiki. Japan Atomic Energy Research Inst., Tokyo (Japan). Oct 1989. 28p. (In Japanese). Order Number DE90759881. Available from NTIS (US Sales Only), PC A03/MF A01.

Radionuclide migration tests by radioactive contaminated water were carried out using four kinds of undisturbed aerated soil samples (upper and lower layer of loamy soil, sandy soil, tuff soil) taken out from the final storage site of low-level radioactive waste, in order to obtain realistic data on radionuclide migration in the soil layer. Based on the analysis of data obtained from the tests, the retardation ability of these soil layers was evaluated. The concentration of ^{85}Sr and ^{137}Cs in effluent was less than detection limit (2×10^{-7} μCi/ml), and that of ^{60}Co rose to 5×10^{-6} μCi/ml. It was found that these soil layers have a larger retention ability of radionuclides. Difference in the radionuclide migration was observed between portions of high concentration (10^{-2} μCi/g) and low concentration (10^{-4} μCi/g) of radionuclides in the soil layer. In the portion of high concentration, a large portion of the radionuclide was adsorbed mainly on the surface of soil layers and its behavior was not dependent on kinds of soil layer. In the portion of low concentration, a slight portion of the radionuclide migrated to deeper layer. The migration rate of ^{60}Co was particularly high in the upper layer of loamy soil. Difference in the radionuclide distribution might be caused by the chemical form of radionuclide and the properties of soil layer. Calculating the retardation factor from the portion of high concentration by using the radionuclide migration model of the unsaturated soil layer, value of $10^3 \approx 10^4$ order was obtained. It was confirmed that these soil layers have a large retention ability for ionic radionuclides. As to the portion of low concentration, nonionic radionuclide are considered to be taken part in the migration and the retardation factor was $1 \approx 2$ order lower than that of the portion of high concentration. (author).

22546 (JAERI-M–89-189) **Migration behavior of radionuclide in soil layer of final storage site: Radionuclide migration test in aerated soil layer by precipitation.** Yamamoto, Tadatoshi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai

Research Establishment); Takebe, Shinichi; Ogawa, Hiromichi; Tanaka, Tadao; Mukai, Masayuki; Komiya, Tomokazu; Yokomoto, Seiichi; Wadachi, Yoshiki. Japan Atomic Energy Research Inst., Tokyo (Japan). Nov 1989. 23p. (In Japanese). Order Number DE90759904. Available from NTIS (US Sales Only), PC A03/MF A01.

Radionuclide migration tests by precipitation were carried out using four kinds of undisturbed aerated soil samples (upper and lower layer of loamy soil, sandy soil, tuff soil) taken out from the final storage site of low-level radioactive waste, in order to obtain realistic data on radionuclide migration in the soil layer. Based on the analysis of data obtained from the tests, the retardation ability of these soil layers was evaluated. The concentration of ^{85}Sr and ^{137}Cs in effluent was less than detection limit ($2x10^{-7}$ μCi/ml), and that of ^{60}Co was $10^{-7} \approx 10^{-6}$ μCi/ml. In the surface soil layer, radionuclide concentration decreased exponentially with depth. A large portion of ionic radionuclide was adsorbed on the surface of soil layer and its behavior was not dependent on kinds of soil layer. In the deeper soil layer, radionuclide concentration decreased smoothly with depth. A difference in the migration of non-ionic radionuclides was observed and caused by the kinds of radionuclide and soil layer. Calculating the retardation factor from the portion of high concentration in the surface soil layer, value of $10^3 \approx 10^4$ was obtained. It was confirmed that these soil layers have a large retention ability for ionic radionuclides. As to the portion of low concentration, non-ionic radionuclides are considered to be taken part in the migration and the retardation factor was $1 \approx 2$ order lower than that of the portion of high concentration. Compared with the result of radionuclide migration test by flow down of radioactive contaminated water, some differences in retardation factor were obtained from concentration distribution of surface soil layer in this test. A slight larger retardation factor of ^{60}Co for the upper layer of loamy soil was observed in the deeper soil layer. (author).

22547 (Juel-Spez–503 B196-B218) **Residue analyses of environmental pollutants in compartments of terrestrial ecosystems.** Mueller-Wegener, U. Kernforschungsanlage Juelich GmbH (Germany, F.R.). Projektleitung Biologie, Oekologie, Energie (PBE). Jun 1989. (In German). Contract BMFT 0373673. In *Search for indicatory criteria to predict effects of chemical induced stress on ecosystemal level. Vol. 12. Final reports of sponsored projects. Pt. 2.* Order Number DE90759497. Available from NTIS (US Sales Only), PC A24/MF A01.

Methods for extraction and detection for soil, plant and animal samples of two chemicals relevant to the environment, 2,4-dichlorophenoxyacetic acid (2,4-D) and pentachlorophenol (PCP) have been evolved and optimized. The quantitative determination has been done by gas chromatography with packed columns and a detector specific to electronegative atoms, the electron capture detector (ECD). Both chemicals have been chromatographed as derivatives. The elaborated methods have been used for mass examinations of samples prepared by the zoological and botany teams (FKZ 03 73 259). (orig.).

22548 (NSS/R–160) **Small angle neutron scattering studies of diffusion and permeation through pores in clays.** Allen, A.J. (UKAEA Harwell Lab. (UK). Materials Physics and Metallurgy Div.); Baston, A.H.; Bourke, P.J.; Jefferies, N.L. United Kingdom Nirex Ltd., Harwell (UK). Sep 1988. 68p. (AERE-R–13261). Order Number DE90619464. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

An extensive study using small angle neutron scattering (SANS) has been made of the pore structures in naturally compacted London, Oxford and Lower Lias clays and in commercially purified montmorillonite and kaolinite. All the pore volumes were initially filled with H_2O. Using SANS contrast variation techniques, the accessibilities of the pores to D_2O by diffusion and permeation have been studied and the generic behaviour of each of the materials has been determined. The results are in qualitative agreement with other mass transfer measurements and suggest that access to some of the porosity takes more than a thousand hours. Most noticably in Oxford clay, a disproportionately large fraction of the surface area appears to be contained in porosity which is inaccessible in such times. Characterisation of the accessibility in different parts of the pore structure is intended to provide input data for models of radionuclide transport through clay geological barriers. Similar application is envisaged in connection with enhanced oil recovery. (author).

22549 (NUREG–1392) **Leakage of an irradiator source: The June 1988 Georgia RSI [Radiation Sterilizers, Inc.] incident.** Nuclear Regulatory Commission, Washington, DC (USA). Office of Governmental and Public Affairs; Georgia Dept. of Natural Resources, Atlanta, GA (USA). Environmental Protection Div. Feb 1990. 45p. Sponsored by Nuclear Regulatory Commission. Available from NTIS, PC A03/MF A01 - GPO; OSTI; INIS.

On June 6, 1988, operators of a pool irradiator in Decatur, Georgia, were prevented by a safety system from raising sources from the pool. Radiation levels of 60 millirem per hour at the surface of the pool water were found, indicative of a leak of one or more of the 252 Cs-137 source capsules used at the irradiator. A summary of the Incident Evaluation Task Force's First Interim Report has been prepared for person's needing an overview of the incident and lessons learned to date. This report provides a summary of Agreement States' views and recommendations on some of the issues raised by the incident.

22550 (ORNL–6608) **Environmental regulatory update table, January 1990.** Houlberg, L.M.; Langston, M.E.; Nikbakht, A.; Salk, M.S. Oak Ridge National Lab., TN (USA). Feb 1990. 103p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract AC05-84OR21400. Order Number DE90008024. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

Environmental Sciences Division Publication No. 3447.

The Environmental Regulatory Update Table provides information on regulatory initiatives of interest to DOE operations and contractor staff with environmental management responsibilities. The table is updated each month with information from the Federal Register and other sources, including direct contact with regulatory agencies. Each table entry provides a chronological record of the rulemaking process for that initiative with an abstract and a projection of further action.

22551 (ORNL–6608/R1) **Environmental regulatory update table, February 1990.** Houlberg, L.M.; Langston, M.E.; Nikbakht, A.; Salk, M.S. Oak Ridge National Lab., TN (USA). Mar 1990. 109p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract AC05-84OR21400. Order Number DE90008019. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

Environmental Sciences Division Publication No. 3248.

The Environmental Regulatory Update Table provides information on regulatory initiatives of interest to Department of Energy (DOE) operations and contractor staff with environmental management responsibilities. The table is updated each month with information from the Federal Register and other sources, including direct contact with regulatory agencies. Each table entry provides a chronological record of the rulemaking process for that initiative with an abstract and a projection of further action.

22552 (ORNL/M–1029) **Environmental sciences division long-range plan: FY 1990 to FY 1994.** Oak Ridge National Lab., TN (USA). Mar 1990. 31p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract AC05-84OR21400. Order Number DE90008763. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The mission of the Environmental Sciences Division (ESD) at Oak Ridge National Laboratory (ORNL) is to conduct environmental research and analyses associated with energy technology development and the interaction between man and the environment in support of US Department of Energy and ORNL goals. In support of this mission, ESD's goal is to be an international center of excellence in interdisciplinary environmental research for understanding and predicting environmental changes and for reducing risks. The plan serves as a framework and management guide for implementing actions to meet both scientific and operational objectives. These objectives include pursuing existing opportunities as well as establishing initiatives in the Division's six major programmatic areas: environmental toxicology, global environmental studies, landscape and ecosystem analysis, regulatory compliance and assessment, renewable resources, and waste research and development. Continued development of common values and objectives

among research and managerial staff is also encouraged in the plan. This report summarizes the objectives, together with the issues and challenges affecting them, and outlines the specific action plans designed to achieve these goals. 3 refs., 2 figs., 4 tabs.

22553 (PB–90-131657/XAB) **Leaching of heavy metals from thermally decontaminated soils.** Mooren, J.J.M.; van der Heide, J. Technische Hogeschool Delft (Netherlands). Dept. of Sanitary Engineering and Water Management. Mar 1989. 31p. (COMMUNICATION–29). Available from NTIS, PC A03/MF A01.

This report describes a research orientated at the effects on the environment due to the application of thermally decontaminated soils. Soil samples were taken from three thermally decontaminating plants. The composition of the soil, metal concentrations, and buffer capacity were determined to characterize the soils. The metal concentrations were compared with tentative reference values for unpolluted soils, which they did not meet fully. The leaching behavior was investigated using a tentative standard leaching test. The main conclusion of the investigation is, that all three soils can be applied without any restrictions, according to the present views. It was found that the soil with the lowest metal concentration gave the highest leaching percentage.

22554 (PB–90-137142/XAB) **Health assessment for Caldwell Trucking Company, Fairfield, New Jersey, Region 2. CERCLIS No. NJD048798953. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). Oct 1988. 16p. Available from NTIS, PC A03/MF A01.

The Caldwell Trucking Company (Caldwell) National Priorities List Site is located in Fairfield Township, Essex County, New Jersey. Volatile organic compounds (VOCs) and polychlorinated biphenyls (PCBs) were detected in the soils and sediments sampled at the site. Low levels of VOCs were also detected in the surface water. The Record of Decision has not addressed the concerns for the surface water, the sediment, or the ground-water plume. The site is currently a potential public health concern.

22555 (PB–90-137225/XAB) **Health assessment for Cosden Chemical Coatings NPL (National Priorities List) site, Beverly, New Jersey, Region 2. CERCLIS No. NJD000565531. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 7 Jul 1988. 7p. Available from NTIS, PC A02/MF A01.

The Cosden Chemical Coatings Site is on the National Priorities List. The contaminants of concern at the site includes polychlorinated biphenyls, methylene chloride, chromium, lead, toluene, and ethyl benzene. The site is considered to be of potential public health concern because of the risk to human health caused by the possibility of exposure to hazardous substances via on-site ingestion of contaminated soil and inhalation of chemical vapors and contaminant-entrained dust.

22556 (PB–90-137407/XAB) **Health assessment for Horstmann's Dump, East Hanover, New Jersey, Region 2. CERCLIS No. NJD981084577. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 7 Jul 1988. 7p. Available from NTIS, PC A02/MF A01.

The Horstmann's Dump is proposed for listing on the National Priorities List. A former operating landfill, located in East Hanover, New Jersey, the one-acre site allegedly received hazardous wastes from 1965 to 1973. Cadmium was reported in on-site soils. Off-site sediments contained polychlorinated biphenyls, toluene, polycyclic aromatic hydrocarbons, chlorobenzenes, and cadmium. Off-site surface water was found to contain nickel. The site is considered to be of potential public health concern because of the risk to human health caused by the possibility of exposure to hazardous substances via soil and water.

22557 (PB–90-137506/XAB) **Health assessment for Myers Property, Franklin Township, New Jersey, Region 2. CERCLIS No. NJD980654198. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 10 Apr 1989. 8p. Available from NTIS, PC A02/MF A01.

The Meyers Property Site (MPS) is on the National Priorities List. MPS was a former pesticide manufacturing operation. Preliminary on-site surface and subsurface soil (24 inches below the surface) sampling results have identified organochlorine residues. They include DDT, DDD, and DDE. Dioxin was identified in soil (ND to 5 ppb). The site is considered to be of public health concern because of the risk to human health caused by the likelihood of human exposure to hazardous substances via direct contact, ground water, and the food chain.

22558 (PB–90-137563/XAB) **Health assessment for Pijak Farm, Plumsted Township, New Jersey, Region 2. CERCLIS No. NJD980532808. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 3 Oct 1988. 9p. Available from NTIS, PC A02/MF A01.

The Pijak Farm Site is a National Priorities List site located approximately 2 miles northeast of the Town of New Egypt, in Plumsted Township, Ocean County, New Jersey. Certain areas of the farm served as disposal sites for a variety of industrial and domestic wastes. Industrial wastes, allegedly from Thiokol Corporation, were dumped into a natural ditch along the edge of a field and covered with soil. In addition, dumping took place in several areas adjacent to wooded and low-lying areas. The soil contaminants on-site included metals, phenolics, solvents, and polychlorinated biphenyl compounds (PCBs). Although the contamination is apparently not site-related, these wells should be reevaluated and if mercury contamination is confirmed, then actions to remove it should be developed and implemented.

22559 (PB–90-137589/XAB) **Health assessment for Reich Farm National Priorities List (NPL) site, Pleasant Plains, Ocean County, New Jersey, Region 2. CERCLIS No. NJD980529713. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 20 Apr 1989. 25p. Available from NTIS, PC A03/MF A01.

The Reich Farm is a National Priorities List site located in the City of Pleasant Plains, Ocean County, New Jersey. Elevated levels of various organic compounds and heavy metals have been identified in on-site subsurface soils and in on-site and off-site ground water. The site is of potential public health concern because of the risk to human health that could result from possible exposures to hazardous substances at levels that may result in adverse health effects over time.

22560 (PB–90-137647/XAB) **Health assessment for Scientific Chemical Processing, Carlstadt, Bergen County, New Jersey, Region 2. CERCLIS No. NJD070565403. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 4 Jan 1989. 9p. Available from NTIS, PC A02/MF A01.

The Scientific Chemical Processing site is on the National Priorities List. The six-acre site is a former waste-processing facility which accepted various wastes for recovery and disposal. On-site soil contamination (maximum concentrations reported) consists of volatile organic hydrocarbons (VOCs) (18,580 ppm); benzidine (244 ppm); petroleum hydrocarbons (81,600 ppm); polynuclear aromatic hydrocarbons (PAHs) 1,892 ppm; pesticides (264 ppm); polychlorinated biphenyls (PCBs) (15,000 ppm); and heavy metals. On-site ground water contamination (maximum concentrations reported) consists of VOCs (3,600 ppm); PCBs (17 ppm); PAHs (3 ppm); petroleum hydrocarbons (2,270 ppm); and heavy metals. The site is considered to be of potential public health concern because of the possibility of exposure to hazardous substances via contaminated ground water, soil, sediment, surface water, and air.

22561 (PB–90-137688/XAB) **Health assessment for Spence Farm, Ocean County, Plumsted Township, New Jersey, Region 2. CERCLIS No. NJD980532816. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 6 Apr 1989. 11p. Available from NTIS, PC A03/MF A01.

The Spence Farm Site (Spence) is a National Priorities List site located in Plumsted Township, Ocean County, New Jersey. Certain areas of the farm served as disposal sites for a variety of industrial and domestic wastes. Industrial wastes, allegedly from Morton Thiokol Corporation, were dumped in scattered low-lying, wooded areas throughout the 30-acre site. The Record of Decision signed September 1984 mandated the removal and off-site disposal of all drums and lab packs, excavation and off-site disposal of visibly contaminated soil, construction of sediment controls during excavation and sampling efforts, and monitoring of on-site wells annually for 5

years. The removals have been completed. The site is of potential public health concern because of the potential risk to human health resulting from the possible exposure to hazardous substances via soil, sediment, ground water, surface water, air, and biota.

22562 (PB–90-137696/XAB) **Health assessment for Swope Oil Company, Pennsauken, Camden County, New Jersey, Region 2. CERCLIS No. NJD041743220. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 6 Apr 1989. 13p. Available from NTIS, PC A03/MF A01.

Swope Oil Company site is a National Priorities List site. Swope Oil Company, a chemical reclamation facility, was in operation from 1965 until December 1979 processing oils, paints, and other chemical compounds. The surface and subsurface soils and ground water are contaminated with polychlorinated biphenyls (PCBs), volatile organic compounds (VOCs), phthalate esters, and metals. The site poses a potential health concern for unauthorized persons entering the site, remedial workers, and railroad personnel who may work adjacent to the site. Also, the migration of contaminants into the ground water poses a potential health concern.

22563 (PB–90-137720/XAB) **Health assessment for Universal Oil Products National Priorities List (NPL) site, East Rutherford, New Jersey, Region 2. CERCLIS No. NJD002005106. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 10 Apr 1989. 10p. Available from NTIS, PC A02/MF A01.

The 75-acre Universal Oil Products property is located in East Rutherford, New Jersey. Aromatic chemicals were produced at the property beginning in 1932. Analyses of on-site soil samples show volatile organic compounds (VOCs) (e.g., benzene), polychlorinated biphenyls (PCBs), and heavy-metal (e.g., lead) contamination within the top four feet. The site is considered to be of public health concern because of the risk to human health caused by the likelihood of exposure to hazardous substances via ingestion, inhalation, and direct dermal contact with contaminants in the soil, ground water, surface water, and sediment. There is also a possibility of exposure to hazardous substances via ingestion of contaminated biota.

22564 (PB–90-137746/XAB) **Health assessment for Ventron/Velsicol, Wood-Ridge Borough, Bergen County, New Jersey, Region 2. CERCLIS No. NJD980529879. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 10 Apr 1989. 8p. Available from NTIS, PC A02/MF A01.

The Ventron/Velsicol Site (VVS) is on the National Priorities List. The 40-acre site is located in Wood Ridge and Carlstadt Borough (Bergen County), New Jersey. VVS is a former chemical process operation. Preliminary on-site soil-sampling results have identified mercury (2 to 123,000 ppm), lead (92 to 5,710 ppm), cadmium (2 to 78 ppm), nickel (13 to 164 ppm), arsenic (less than 0.5 to 148 ppm), and zinc (42 to 128,454 ppm). In addition, mercury was also identified in surface water (1 to 16 ppm), sediment (147 to 4,480 ppm), and groundwater (1 to 30,890 ppb). The site is considered to be of public health concern because of the risk to human health caused by the likelihood of human exposure to hazardous substances via direct contact and ingestion of soil, sediment, ground water, and surface water.

22565 (PB–90-137761/XAB) **Health assessment for Waldick Aerospace Devices, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD054981337. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 29 Feb 1988. 16p. Available from NTIS, PC A03/MF A01.

The 1.72-acre Waldrick Aerospace Devices site is located in Wall Township, Monmouth County, New Jersey. Surface soils and ground water are contaminated with volatile organic chemicals, petroleum hydrocarbons, chromium, and cadmium; building interiors are contaminated by a wide variety of process chemicals and pesticides. Although there are small, on-site areas with high concentrations of soil contaminants, the areas are vegetated and partially fenced to discourage trespassing. Access to these areas should be restricted until the soils are decontaminated or removed.

22566 (PB–90-138777/XAB) **Health assessment for Hooker/Ruco, Hicksville, New York, Region 2. CERCLIS No. NYD002920312. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). Jun 1988. 16p. Available from NTIS, PC A03/MF A01.

The Ruco Polymer Corporation-Hicksville Facility, Nassau County, Hicksville, New York, formerly owned and operated by Hooker Chemical and Plastics Corporation is on the National Priorities List. Prior to 1980, process waste waters containing high concentrations of vinyl chloride, chlorinated solvents, alcohols, glycols, plasticizers and esters were discharged into leaching sumps at the facility. On-site soils and ground water underlying the site are contaminated. At several locations on-site, surface soils are contaminated with organic compounds. Soil samples taken at 1-2 feet depths revealed maximum concentrations of tetrachloroethene to be 244 mg/kg and PCBs (Arochlor 1248) to be 23,000 mg/kg. The site is considered to be of potential public health concern because of the risk to human health caused by possible exposure to hazardous substances via the ingestion and inhalation of contaminants present in the ground water. Exposure of on-site workers to contaminated soil and to volatilized organic chemicals emanating from the soil is also of concern.

22567 (PB–90-138785/XAB) **Health assessment for S-Area Landfill/Hooker, Niagara Falls, New York, Region 2. CERCLIS No. NYD000000001. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). Jun 1989. 12p. Available from NTIS, PC A03/MF A01.

The S-Area Landfill is a National Priorities List site located in Niagara Falls, New York, that was operated from 1947 to 1975 by the Occidental Chemical Corporation (OCC). From 1947 to 1975, OCC is reported to have disposed of an estimated 19,000 tons of chlorobenzenes and approximately 17,000 tons of hexachlorocyclopentadiene. Other wastes disposed of at the site include organic phosphates, hexachlorobutadiene, trichlorophenols, and chlorinated toluenes. Environmental contamination from the S-Area exists on-site and off-site in soils and ground water. Further off-site contamination potentially exists in the Niagara River. The S-Area presents a potential public health threat to the consumers of the City of Niagara Falls drinking water and an incremental increase in contamination to fish in the Niagara River.

22568 (PB–90-138959/XAB) **Health assessment for Applied Environmental Services, Glenwood Landing, New York, Region 2. CERCLIS No. NYD980535652. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). Jun 1988. 10p. Available from NTIS, PC A02/MF A01.

The Applied Environmental Services (AES)-Shore Realty site is located in the Town of Hempstead, Nassau County, New York. Although all the liquid chemicals stored in tanks and drums have been removed from the site, spills, leaks or other activities have left on-site soil, ground water and surface waters contaminated. On-site soils are contaminated with ethylbenzene and toluene. Ground water samples collected between 1984 and 1988 from nine on-site monitoring wells contained ethylbenzene, xylenes, and toluene. A sediment sample contained PCBs and other sediment samples contained ethylbenzene and xylene. The site is considered to be a potential health concern because of risk to human health caused by the possibility of exposures to site-related contaminants both on-site and off-site.

22569 (PB–90-139015/XAB) **Health assessment for Cortese Landfill, Sullivan County, Tusten, New York, Region 2. CERCLIS No. NYD980528475. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). 30 Jun 1989. 14p. Available from NTIS, PC A03/MF A01.

The Cortese Landfill in the Town of Tusten, Sullivan County, New York is on the National Priorities List. Analytical data indicate that the contaminants of concern are arsenic, benzene, 1,2-trans-dichloroethene, 1,4-dichlorobenzene, 1,1-dichloroethane, toluene, xylene (all isomers), and vinyl chloride. The site poses a potential public health concern to residents living near the site and possibly to people using the Delaware River as a recreation source.

22570 (PB–90-139031/XAB) **Health assessment for F.M.C. Corporation, Orleans County, Shelby, New York, Region 2. CERCLIS No. NYD000511857. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). 30 Jun 1989. 12p. Available from NTIS, PC A03/MF A01.

The Dublin Road Landfill Site is on the National Priorities List. Results of chemical analysis of soil samples collected from the waste-pile area in 1983 indicated the presence of arsenic, lead, various isomers of BHC, and DDT and its derivatives. The site poses a potential public health concern to area residents using private wells located downgradient from the site, users of Jeddo Creek Dublin Road, and, to a lesser extent, the users of the Barge Canal for recreational purposes.

22571 (PB–90-139122/XAB) **Health assessment for Marathon Battery, Cold Springs, New York, Region 2. CERCLIS No. NYD001959757. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 16 Jul 1987. 15p. Available from NTIS, PC A03/MF A01.

The 11-acre Marathon Battery Site (MBS) Plant is located in Putnam County, Cold Springs, New York. The site is bordered to the east by a wooded area and to the south by a junkyard and Foundary Cove. Foundary Cove is a wetland marsh connected by several channels to the Hudson River. Various heavy metals have been identified on-site. They include arsenic, cadmium, cobalt, lead, nickel, and zinc. In addition, a previous ATSDR memorandum reports the results of a ground-water sample containing high concentrations of trichloroethylene. Based on the preliminary information reviewed concerning on-site and off-site contamination, MBS represents a potential public health threat to area residents.

22572 (PB–90-139130/XAB) **Health assessment for Jones Sanitation Landfill (Jones Septic Site), Hyde Park, Dutchess County, New York, Region 2. CERCLIS No. NYD980534556. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 7 Jul 1988. 7p. Available from NTIS, PC A02/MF A01.

The Jones Sanitation Landfill, also known as the Jones Septic Site, is listed on the National Priorities List. From the early 1960s through 1979 the site accepted industrial liquid wastes and sludges. The site now accepts only septic waste collected by commercial firms. Results of environmental sampling indicate that the contaminants of concern at the site include inorganics (e.g., chromium, copper, lead, cadmium, mercury), oil and grease wastes, and several volatile organic chemicals including: 1,1-dichloroethylene; trichloroethylene; trichloroethene, acetone; 1,2,4-trichlorobenzene; chloroform; methylene chloride; and perhaps pentachlorophenol. Based on the available information, the site is considered to be of potential public health concern because of the risk to human health caused by the possibility of exposure to hazardous substances via the above-named human exposure pathways.

22573 (PB–90-139973/XAB) **Health assessment for General Electric Wiring Devices, Juana Diaz, Puerto Rico, Region 2. CERCLIS No. PRD090282757. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 16 Mar 1988. 12p. Available from NTIS, PC A03/MF A01.

The General Electric Wiring (GEW) Devices Site is located in Juana Diaz, Puerto Rico. Activities at the site primarily involved production of electrical devices, including switch buttons containing elemental mercury. Broken buttons, containing traces of mercury, were discarded in the waste fill at GEW over a period of 20 years. Mercury was later found to be present in the upper 2-3 feet of soil in the waste fill, and also in the surface soils to the west and south of the fill. Trichloroethylene was also used at the site and on one occasion was observed in ground water. A residential area exists a few hundred feet south of the fill area and its population and others in the general area are potentially at risk from the contaminants through exposure to ground water and contact with contaminated soils.

22574 (PB–90-139999/XAB) **Health assessment for Fibers Public Supply Wells, Guayama, Puerto Rico, Region 2. CERCLIS No. PRD980763783. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 10 Apr 1989. 7p. Available from NTIS, PC A02/MF A01.

The Fibers Public Supply Wells Site is a former synthetic fiber manufacturing plant located in Guayama, Puerto Rico. Currently, a pharmaceutical manufacturing facility operates on-site. In addition, 5 public supply wells exist on-site. Preliminary on-site sampling results have identified acetone (7 to 2,260 ppb in soil), methyl ethyl ketone (ND to 7 ppb in soil), ethylene chloride (ND to 55 ppb in soil), bis(2-ethyl hexyl)phthalate (ND to 1,060 ppb in soil). On-site monitoring-well-sampling results identified perchloroethylene (ND to 198 ppb), trichloroethylene (ND to 18 ppb), vinyl chloride (ND to 28 ppb), and trichlorofluoromethane (ND to 10 ppb). The site is considered to be of potential public health concern because of the risk to human health caused by the possibility of human exposure to hazardous substances. Direct contact with and ingestion of contaminated soil by pharmaceutical employees and possibly area residents who access the site are the most likely exposure pathways. In addition, ingestion and direct contact with ground water may possibly be another exposure route.

22575 (PB–90-140443/XAB) **Health assessment for Pasley Solvents and Chemical, Garden City, New York, Region 2. CERCLIS No. NYD991292004. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). Jun 1989. 11p. Available from NTIS, PC A03/MF A01.

The Pasley Solvents and Chemicals site, a National Priorities List site, is located in the Town of Hempstead, immediately east of the Village of Garden City in Nassau County, New York. Between 1969 and 1982, Pasley operated a chemical distribution facility on the lot, occasionally storing waste chemicals. Prior to this, Commander Oil used the site for gasoline storage and fuel oil distribution. The Nassau County Health Department (NCHD) investigated the site in 1981 and found the on-site soil and ground water to be contaminated with organic solvents and petroleum products. On-site sampling by NCHD and the owner has revealed organic chemicals and petroleum products in both soil and ground water. Six chlorinated solvents and four aromatic compounds are in ground water above the part per million. The site is a potential threat to public health.

22576 (PB–90-855958/XAB) **Ground subsidence due to mining operations. October 1976-November 1989 (Citations from the COMPENDEX data base). Report for October 1976-November 1989.** National Technical Information Service, Springfield, VA (USA). Jan 1990. 93p. Available from NTISPC N01/MF N01.

This bibliography contains citations concerning ground subsidence associated with mining operations. Mine subsidence is discussed with reference to mathematical modeling, forecasting extent of cavitation, and rock mechanics and mechanisms of stress relaxation. Damage to above- and below-ground structures as well as agricultural areas, and mining techniques designed to prevent or reduce subsidence are included. Monitoring of subsidence and detection of cavitation for surface, underground, and ocean-floor mining areas are discussed and examples are analyzed. Subsidence due to aquifer water removal is referenced in a related published bibliography. (Contains 213 citations fully indexed and including a title list.)

22577 (PNL–6100-Pt.4, pp. 11-12) **Continuous-wave double-resonance ionization mass spectrometry.** Whitaker, T.J.; Cannon, B.D.; Gerke, G.K.; Bushaw, B.A. Pacific Northwest Lab., Richland, WA (USA). Feb 1987. In *Pacific Northwest Laboratory: Annual report for 1986 to the DOE Office of Energy Research: Part 4, Physical sciences.* Order Number DE87010025. Available from NTIS, PC A04/MF A01.

Pacific Northwest Laboratory is developing laser-based methods for measuring low levels of toxic materials and environmentally hazardous substances. In the last year, development of continuous-wave double-resonance ionization mass spectrometry has been continued. That technique combines isotopically selective ionization with mass spectrometry to provide improved discrimination against isobaric interferences. Continuous-wave (cw) lasers offer two distinct advantages over pulsed lasers in analytical applications; they typically have narrower bandwidths by 3 to 4 orders of magnitude, and they have unity duty cycle. A technique has been developed that employs two cw dye lasers to sequentially excite an atomic species to a high electronic state. The excited atoms are then photoionized by a powerful infrared laser. The cw dye lasers have very high-wavelengths resolution and can be tuned to a specific isotope of the target element. This technique, with its combination of mass selectivity from the mass spectrometer with isotopic selectivity in the laser ionization step, makes

possible the analysis of the isotopic abundances of 10^{11} and greater. The sensitivity has been improved by exciting the atom to a higher electronic state and using a CO_2 laser for photoionization. This method is significantly better than most ionization techniques used in mass spectrometry and provides the added advantage of elemental and isotopic selectivity.

22578 (PNL–7116) **Radon transport in dry, cracked soil: Two-dimensional, finite element model.** Holford, D.J. (Pacific Northwest Lab., Richland, WA (USA)); Schery, S.D.; Wilson, J.L.; Phillips, F.M. Pacific Northwest Lab., Richland, WA (USA). Dec 1989. 116p. Sponsored by U.S. DOE Energy Research. DOE Contract AC06-76RL01830. Order Number DE90008099. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

A two-dimensional finite element code, CRACK, simulates the effect of changes in surface air pressure on radon concentration in soil with parallel, partially penetrating cracks. A sensitivity analysis investigates the effect of changes in crack dimensions, soil characteristics, and surface air pressure on radon flux to the atmosphere from a dry, cracked soil. Radon flux is found to be most sensitive to changes in soil properties: the diffusion coefficient is most important, followed by permeability and porosity. Radon flux is also sensitive to changes in barometric pressure. Cracks have a more significant effect on radon flux from soils of low permeability. The effects of moisture should be considered in future studies, because of moisture's importance to the effective air-filled porosity, air permeability, and diffusion coefficient of soils.

22579 (PSI–53) **Modelling of a diffusion-sorption experiment on sandstone.** Smith, P.A. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)). Paul Scherrer Inst. (PSI), Wuerenlingen (Switzerland). Nov 1989. 28p. Order Number DE90619465. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The results of a diffusion-sorption experiment on a sample of Darley Dale sandstone, using simulated groundwater spiked with a mixture of ^{125}I, ^{85}Sr and ^{137}Cs, are modelled by a one-dimensional porous medium approach in which sorption is described by Freundlich isotherms. The governing equations are solved analytically for the special case of a linear isotherm, and numerically using the computer code RANCHDIFF for non-linear isotherms. A set of time-dependent, ordinary differential equations is obtained using the Lagrange interpolation technique and integrated by Gear's variable order predictor-corrector method. It is shown that the sorption behaviour of ^{85}Sr can be modelled successfully by a linear isotherm, using a sorption parameter consistent with batch-sorption tests. The behaviour of ^{137}Cs may be modelled by a non-linear isotherm, but the amount of ^{137}Cs sorbed is less than that anticipated from batch-sorption tests. ^{125}I is assumed to be non-sorbing and is used to determine the porosity of the sandstone. (author) 10 figs., 4 tabs., 6 refs.

22580 (PSI–54) **Radionuclide chain transport with matrix diffusion and non-linear sorption.** Jakob, A. (Paul Scherrer Inst. (PSI), Wuerenlingen (Switzerland). Programm Entsorgung); Hadermann, J.; Roesel, F. Paul Scherrer Inst. (PSI), Wuerenlingen (Switzerland). Nov 1989. 64p. Order Number DE90619466. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

The present paper describes a two-dimensional model for radionuclide transport in inhomogeneous rock. Advective and dispersive flux takes place in water conducting zones which may consist of a network either of tubelike veins or planar fractures. Out of these flowpaths nuclides diffuse into stagnant pore water of a spatially limited, adjacent zone (matrix diffusion). Sorption on rock surfaces is described by a non-linear isotherm. Under specific conditions matrix diffusion can be represented by an effective (non-linear) surface sorption. Radioactive decay and, in the case of a nuclide chain, ingrowth is also included in the model. The numerical solutions of transport equations based on the method of lines are developed in detail. The advantages of this approach are the efficiency, the reliability and the general flexibility especially to include arbitrary boundary and initial conditions and arbitrary solute/rock interactions. For ^{135}Cs we present in a comprehensive sensitivity analysis the impact of non-linear (Freundlich) sorption isotherm on break-through curves. It is shown that, provided transport times are comparable or larger than nuclide half-life, non-linear sorption may reduce concentrations at the geosphere outlet by orders of magnitude. Some results are also given for the transport of the ^{238}U chain. (author) 25 figs., 2 tabs., 27 refs.

22581 (RFP-ENV–88) **Rocky Flats Plant site environmental report for 1988, January through December 1988.** Daugherty, N.M. (ed.). Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant. May 1989. 95p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP03533. Order Number DE90006469. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

This report documents the 1988 environmental surveillance program at the Rocky Flats Plant. The report includes an evaluation of plant compliance with all appropriate guides, environmental limits, and standards. Potential radiation dose to the public was calculated from average radionuclide concentrations measured at the plant property boundary and in surrounding communities. 37 refs., 14 figs., 32 tabs.

22582 (STUK-A–76) **Environmental gamma radiation and fallout measurements in Finland, 1986-87: Supplement 2 to annual report STUK-A-74.** Arvela, H.; Markkanen, M.; Lemmelae, H.; Blomqvist, L. Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland). Jul 1989. 32p. Order Number DE90619462. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Results from a survey of environmental gamma radiation levels in Finland after the Chernobyl accident 1986 are presented. The measurements were made in 1986-87 by means of sensitive Geiger-counters and a gamma-spectrometer placed in cars. The results show the level of external radiation caused by the cesium fallout on the first of October 1987. The fallout pattern of ^{137}Cs as well as of ^{95}Zr and ^{103}Ru are also presented. In the center of Southern Finland there are wide areas with exposure levels exceeding 0.03 $\mu Sv\ h^{-1}$, areas exceeding 0.10 $\mu Sv\ h^{-1}$ being very rare. The surface area weighted mean dose rate for the 461 municipalities in Finland was 0.027 $\mu Sv\ h^{-1}$ (range 0-0.19 $\mu Sv\ h^{-1}$). The population weighted mean dose rate was 0.037 $\mu Sv\ h^{-1}$. The corresponding estimated surface activity of ^{137}Cs was 10.7 kBq m^{-2}. The passage of the Chernobyl plume over Finland in 1986 led to various fallout patterns for different radionuclides. The deposition of the non-volatile nuclides, ^{95}Zr and ^{141}Ce, is closely related to the passage of the hot particle dust formed at the initial explosion in the reactor at 01.23 LT on 26 April. This cloud passed over Finland between the morning and the night of 27 April. The deposition of volatile fission products such as ^{131}I, ^{132}Te, ^{134}Cs and ^{137}Cs in Finland was caused by releases from the burning reactor after the initial explosion. The radioactive plume spread over Southern and Central Finland between Sunday 27 April and Tuesday 29 April. On 30 April and finally on 1 May a could northerly airstream spread into the whole of Finland purifying the atmosphere. The volatile nuclides were mainly deposited by intermittent rain on 28-30 April. (Abstract Truncated)

22583 (STUK-A–84) **Radioactivity of sludge in Finland in 1987: Supplement 10 to annual report STUK-A-74.** Puhakainen, M.; Rahola, T. Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland). May 1989. 27p. Order Number DE90619467. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Sewage sludge from municipal wastewater treatment plants was studied to determine its radionuclide concentrations. Measurements were made to find out whether any radionuclides from the nuclear power stations at Loviisa and Olkiluoto and from hospitals and medical laboratories could be detected in sludge additional to those originating from global and Chernobyl fallout. In the treatment process of water, aluminium sulphate sludge is developed at treatment plants using surface water. This kind of sludge was measured since it also concentrates radionuclides. Fallout nuclides from the Chernobyl nuclear power station after the accident predominated in all sewage sludge samples in Finland. In 1987 six different radionuclides originating from the Chernobyl fallout were detected in sewage sludge. In spring when the snow melted and large quantities of run off water flowed into the treatment plants, the activity concentrations clearly increased, but then started decreasing again. At the end of the year the highest measured ^{137}Cs activity concentrations were below 1000 Bq kg^{-1} dry weight. The

highest activity concentration in sludge originated from iodine used fro medical purposes.

22584 (VR–88-05, pp. 312-314) **BILTH: A radiation-burden model for the contamination pathway air-grass-cow-milk.** . Blaauboer, R.O. Ministerie WVC-RIVM collaboration. Rijksinstituut voor Volksgezondheid en Milieuhygiene, Bilthoven (Netherlands). 1988. (In Dutch). In *Reports from the RIVM 1987.* Order Number DE90619668. Available from NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

The Bilthoven model calculates the contamination of milk via the air-grass-cow-milk pathway after a nuclear accident. For I-131 the calculation was performed for 13 locations partitioned over the Northern Hemisphere and contaminated more or less by 'Chernobylsk'. With the measured concentrations I-131 in grass and milk the model was validated. 2 refs.; 4 figs.; 1 tab.

22585 (WINCO–1071) **ICPP [Idaho Chemical Processing Plant] environmental monitoring report, CY-1988.** Krivanek, K.R. Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (USA). Aug 1989. 53p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-84ID12435. Order Number DE90008032. Available from NTIS, PC A04/MF A01; OSTI; INIS; GPO Dep.

Summarized in this report are the data collected through Environmental Monitoring programs conducted at the Idaho Chemical Processing Plant (ICPP) by the Environmental Engineering (EE) Section of the Nuclear and Industrial Safety (N and IS) Department. The ICPP is responsible for complying with all applicable Federal, State, Local and DOE Rules, Regulations and Orders. Radiological effluent and emissions are regulated by the DOE. The Environmental Protection Agency (EPA) regulates all nonradiological waste resulting from the ICPP operations including all airborne, liquid, and solid waste. The EE subsection completed a Quality Assurance (QA) Plan for Environmental Monitoring activities during the third quarter of 1986. QA activities have resulted in the ICPP's implementation of the Environmental Protection Agency rules and guidelines pertaining to the collection, analyses, and reporting of environmentally related samples. Where no approved methods for analyses existed for radionuclides, currently used methods were submitted for the EPA approval. 33 figs., 14 tabs.

22586 Role of ductile shearing in the concentration of radon in the Brookneal zone, Virginia. Gates, A.E. (Rutgers Univ., Newark, NJ (USA)); Gundersen, L.C.S. *Geology (USA),* 17(5): 391-394 (May 1989).

A positive correlation exists among surface gamma radiation, uranium concentration, and the angles between C and S bands in mylonite and radon in the soils overlying the Brookneal zone of the southwest Virginia Piedmont. Part of the Brookneal zone lies within the compositionally homogeneous Melrose granite, which is undeformed to the west of the zone. The angle between C and S bands in mylonitic Melrose granite varies from 43° in the westernmost protomylonte to near 0° in the easternmost ultramylonite. Radon in the overlying soils increase from 450 picocuries/litre (pCi/L) in underformed granite to as much as 4100 pCi/L in ultramylonite. In undeformed granite, uranium is hosted in titanite and zircon. During mylonitization, uranium was redistributed into the foilation and is associated with hematite and fine-grained monazite. Uranium, however, is in constant proportion to thorium, indicating little introduction of new uranium into the mylonite zone. An increase in the uranium concentration from 1 to 2 ppm in undeformed granite to 7 to 8 ppm in ultramylonite may be the result of volume loss during shearing.

22587 (AD-A–214557/1/XAB) **Initiation decision report: Nonpoint source discharge. Technical note (Final), July 1987-June 1988.** Karr, L.; Heath, J.C. Naval Civil Engineering Lab., Port Hueneme, CA (USA). Aug 1989. 60p. (NCEL-TN–1798). Available from NTIS, PC A04/MF A01.

Under recent amendments to the Clean Water Act, the Navy must be responsible to State's authority in the control of nonpoint sources (NPS) of water pollution. Nonpoint sources are pollutants that do not originate from a single, well-defined source and are initially transported by the natural hydrological system. The sources are diffuse in nature, ranging from storm-water run-off with no single identifiable endpoint, to leachate from abandoned waste sites. The most common Navy nonpoint sources of pollution include storm water run-off from agricultural and range-land leases, construction areas, industrial areas, residential and commercial areas, impact zones, and training areas.

22588 (AD-A–215040/7/XAB) **Environmental feasibility of using wetlands to treat runoff pollution. Final report.** Gadbois, L.E. Naval Ocean Systems Center, San Diego, CA (USA). Oct 1989. 37p. (NOSC/TR–1321). Available from NTIS, PC A03/MF A01.

Chemical and ecological characteristics of wetland types commonly occurring in and around Navy bases are reviewed. The natural wetland processes are examined from the perspective of their capacity to remediate nonpoint source pollution (NPSP). The ecological habitat value of wetlands is iterated, as are the habitat value changes resulting from pollution loading. Five generic pollutant categories of NPSP are discussed: biochemical oxygen demand (BOD), nutrients, suspended particulates, heavy metals, and organics (petroleum, solvents, biocides). The ecological consequences of each pollutant category, the treatment principles for this pollutant category, and how wetlands can provide the necessary treatment conditions are discussed. Choice of the correct wetland morphology is important for effective NPSP remediation. Guidelines for choosing an existing marsh or construction of a new marsh are provided. A tidal salt marsh construction proposal is reviewed to determine the ecological validity, the expected remediation effectiveness, the side effects, and the legal requirements for the construction. The state of the science is still too immature to confidently predict the effectiveness of the marsh at this site. The indications are that insufficient residence time of the water pollutants will minimize the effectiveness. Also, the varied and dynamic exchanges between the marsh and the adjacent water body will hamper efforts to quantitatively determine the level of remediation.

22589 (AI–89-06172) **Water supply constraints to energy development, phase 7: Summary report.** Acres International Ltd., Toronto, ON (Canada). Jul 1988. 155p. (MICROLOG–89-06172). Available from PC WATDOC (Canada), Inland Waters Directorate, Environment Canada, Ottawa, ON, CAN K1A 0H3; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1. Prices: PC PRICES UPON REQUEST; MF $10 CAN.

Inland Waters/Lands, Environment Canada, has progressively been developing a comprehensive capability for evaluating water supply constraints to energy development in Canada. The present work describes further development of the graphics capabilities, enhancements to the industrial water use and demand/price analysis routines, a number of data processing inprovements, expansions of the data base on the Waterton/Saint Mary reservoir in southern Alberta and on the Saskatchewan River Basin, and scenario evaluations for the Saskatchewan River Basin in Alberta and Saskatchewan; supply availability is shown to be a serious problem in the Battle River basin and in the small sub-basins that are modelled separately. Recommendations are given as to future improvements of the model and the data base of reservoir operating policies. 17 refs., 39 figs., 35 tabs.

22590 (CONF-8904311–1) **Trend detection in the presence of covariates: Stagewise versus multiple regression.** Smith, E.P. (Kent Univ., Canterbury (UK). Mathematics Inst.); Rose, K.A. Oak Ridge National Lab., TN (USA). [1989]. 22p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 1. international environmetrics conference; Cairo (Egypt); 3-7 Apr 1989. Order Number DE90006147. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The assessment of trend in water quality is an important task for environmental managers and scientists. An important problem

discussed in this paper is that of the underlying models and mechanisms that relate the water quality time series to other time dependent covariates. There are two basic approaches for the adjustment for covariates that may be used in trend assessment, stagewise regression and multiple regression. By using simulation, analysis and a data set from the Chesapeake Bay, USA, the approach based on stagewise regression is shown to lead to erroneous results in some situations. The method that performs better in these cases is multiple regression which has more power in general than the stagewise method. 10 refs., 4 tabs.

22591 (CONF-9004144–1) **Design of a simulation interface for a parellel computing environment.** Narang, H. (Tuskegee Univ., AL (USA). Dept. of Computer Science); Flanery, R.; Drake, J. Oak Ridge National Lab., TN (USA). [1990]. 19p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Annual ACM south eastern region conference; Atlanta, GA (USA); 13 Apr 1990. Order Number DE90008497. Available from NTIS, PC A03/MF A01 - OSTI.

A user interface for simulation of contaminant transport in groundwater flow using a distributed memory parallel processor is described. The user interface is a menu-mouse driven presentation using the X-Windows software. To facilitate the division and distribution of data among processors and to develop a data structure capable of manipulation for a variety of functions, graphics, remeshing, input and retrieval of auxiliary information, an object oriented programming style is used. The parallel computational model for the update of contaminant concentrations is organized around objects and an explicit time marching algorithm implemented on an IPSC2 Hypercube multiprocessor. 6 refs.

22592 (DOE/ER/60161–T1) **Water Science and Technology Board annual report, 1988.** Parker, S.D. National Research Council, Washington, DC (USA). Water Science and Technology Board. 1990. 70p. Sponsored by U.S. DOE Energy Research. DOE Contract FG01-83ER60161;FG05-89ER60743. Order Number DE90007434. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This annual report of the Water Science and Technology Board (WSTB) summarizes the activities of the Board and its subgroups during 1988, its sixth year of existence. Included are descriptions of current and recently completed projects, new activities scheduled to begin in 1989, and plans for the future. The report also includes information on Board and committee memberships, program operational features, and reports produced during the past several years. This annual report is intended to provide an introduction to the WSTB and summary of its program for the year.

22593 (DOE/ER/60161–T2) **Water Science and Technology Board annual report, 1987: Annual report, 1987.** National Research Council, Washington, DC (USA). Water Science and Technology Board. 1988. 66p. Sponsored by U.S. DOE Energy Research; U.S. Department of the Interior; Environmental Protection Agency; Electric Power Research Institute; U.S. Federal Emergency Management Agency; Ford Foundation; Nuclear Regulatory Commission; National Science Foundati DOE Contract FG01-83ER60161. Order Number DE90007438. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

In 1982, the National Research Council chose to recognize the importance of water resource issues by establishing the Water Science and Technology Board (WSTB). During the five years since its first meeting in November 1982, the WSTB has grown and matured. The WSTB has met 14 times to provide guidance and plan activities. Under the WSTB's direction, committees of experts have conducted approximately 30 studies on a broad array of topics, from dam safety to irrigation-induced water quality problems to ground water protection strategies. Studies have ranged in scope from the oversight of specific agency projects and programs to broader scientific reviews, such as a disciplinary assessment of the hydrologic sciences initiated in 1987. In all cases, studies have the general theme of ultimately improving the scientific and technological bases of programs of water management and environmental quality. Several hundred people have played active roles in these studies. WSTB reports have had and are having important effects, and the WSTB's credibility and visibility have increased with each successive project during its five-year history. The WSTB has proven itself to be a thorough and credible source of advice for the water resources community.

22594 (DOE/ER/60161–T3) **Water Science and Technology Board annual report, 1986: Annual report, 1986.** National Research Council, Washington, DC (USA). Water Science and Technology Board. 1987. 63p. Sponsored by U.S. Department of Defense; U.S. DOE Energy Research; U.S. Department of the Interior; Environmental Protection Agency; U.S. Federal Emergency Management Agency; Nuclear Regulatory Commission; National Science Foundation; State of California; DOE Contract FG01-83ER60161. Order Number DE90007437. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This fourth annual report of the Water Science and Technology Board summarizes the Board's accomplishments during 1986, its current activities, and its plans for the future. The report also includes information on Board and study group memberships, program organization, and reports produced. The Water Science and Technology Board is a unit of the National Research Council, the operating arm of the National Academy of Sciences that exists by virtue of an 1863 act of Congress, instructing it to provide scientific and technological assistance to the federal government. The Board is independent of the federal government, and participants in Board activities serve without compensation. The expertise and resources available to the Board extend across many disciplines and types of organizations concerned with water and related resources. The Board's independence and the resources available to it afford a unique and effective forum for addressing cohesively various important issues on the national water resources agenda. The volunteers who serve the Water Science and Technology Board and the Board's federal agency liaison representatives are the constituency on which it depends for the quality of its work in response to those who seek its advice. In 1986, several hundred individuals participated in Board activities in various capacities.

22595 (DOE/ER/60161–T4) **Water Science and Technology Board annual report, 1985: [Final report].** National Research Council, Washington, DC (USA). Water Science and Technology Board. 1986. 57p. Sponsored by U.S. Department of Defense; U.S. DOE Energy Research; U.S. Department of the Interior; Environmental Protection Agency; U.S. Federal Emergency Management Agency; Nuclear Regulatory Commission; National Science Foundation; U.S. Geological Surv DOE Contract FG01-83ER60161. Order Number DE90007436. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This is the third annual report of the Water Science and Technology Board. The report summarizes the Board's activities during 1985, ongoing activities, and plans for the future. Included also is information on Board and study group memberships, program organization, issues of concern, and reports produced. The Water Science and Technology Board is a unit of the National Research Council (NRC), part of the National Academy of Sciences that exists by virtue of an act of Congress in 1963 instructing it to provide scientific and technological assistance to the federal government. The Board is independent of the federal government, and participants in board activities serve without compensation. The expertise and resources available to the Board extend across many disciplines and types of organizations concerned with water and related resources. The Board's independence and the availability of resources to it afford a unique and effective forum to address cohesively the variety of issues on the national water resources agenda. The volunteers who serve the Water Science and Technology Board and the Board's federal agency liaison representatives are the constituency on which it depends for the quality of its work in response to those who seek its advice. In 1985, several hundred individuals participated in Board activities in various capacities.

22596 (DOE/ER/60161–T5) **Water Science and Technology Board annual report, 1984: [Final report].** National Research Council, Washington, DC (USA). Water Science and Technology Board. 1985. 50p. Sponsored by U.S. Department of Defense; U.S. DOE Energy Research; U.S. Department of the Interior; Environmental Protection Agency; U.S. Federal Emergency Management Agency; National Science Foundation; U.S. Geological Survey;

William H. Donner Foundatio DOE Contract FG01-83ER60161. Order Number DE90007435. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This is the second annual report of the Water Science and Technology Board (WSTB), a unit of the National Research Council (NRC). It summarizes the Board's activities during 1984, ongoing activities (i.e., in 1985), and future plans. Information is included also on Board and study group memberships, program organization, issues of concern, and reports published. For the Water Science and Technology Board, 1984 was marked by several significant events and achievements, and the Board's program for the year must be considered successful. A number of important new activities were undertaken, including a study of the technical and institutional aspects of state and local ground-water protection programs and an assessment of flood and earthquake criteria to be used in the evaluation of the safety of dams. In cooperation with the Royal Society of Canada, a study committee of the Board is reviewing the Great Lakes Water Quality Agreement, with the report likely to make recommendations for consideration by the US and Canadian governments if they renegotiate the Agreement in 1986. A new, standing Committee on Water Resources Research was established to assist the Department of the Interior, through the US Geological Survey, in carrying out its responsibilities under the Water Resources Research Act of 1984 and to assist the Survey and the Board with other water research-related matters.

22597 (DOE/ER/60470–1) **Hypotheses testing of watershed/landscape dynamics in northern Alaska using digital analysis: Final report, July 15, 1986–July 14, 1989.** Evans, B.M.; Petersen, G.W.; Connors, K.F. Pennsylvania State Univ., University Park, PA (USA). Environmental Resources Research Inst. Sep 1989. 113p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-86ER60470. Order Number DE90006721. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

Since July of 1985, Penn State scientists have been cooperating with investigators from other universities in several ecosystem studies at an existing Department of Energy (DOE) study site on the North Slope of Alaska. The primary focus of the REFLEX program is to test new applications of remote sensing systems and allied digital database processing techniques for studying hydrologic/ecologic interactions. One of the goals of this particular REFLEX project was to complement ongoing R4D studies near Toolik Lake. Since their initial cooperative efforts with R4D investigators at the R4D study site in Phase I, scientists (primarily G. Petersen and B. Evans), have been intimately involved with the Landscape Ecology Working Group, one of several such groups established within the R4D program. As part of the R4D program, the Landscape Ecology Working Group is focusing on landscape-scale patterns and interactions that have applications to long slopes, watersheds, and large regions of the Alaskan North Slope.

22598 (DOE/OR/00033–T432) **Effects of environmental and physiological variables on the uptake of hydrophobic contaminants by the gills of rainbow trout, Salmo gairdneri (Richardson).** Black, M.C. Oak Ridge National Lab., TN (USA). May 1989. 126p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-76OR00033. Order Number DE90007697. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

Thesis. Submitted to Univ. of Tennessee, Knoxville.

The uptake of contaminants by diffusion across fish gills may be altered by changes in the contaminant's physicochemical form or changes in fish respiration. This study investigated the effects of changes in contaminant uptake due to sorption to humic acid and changes in fish respiration, induced by altering respiratory demand via an acute change in temperature and by altering the diffusional capacity of the gill membrane by exposure to chlorine. In each experimental design the uptake of selected polycyclic aromatic hydrocarbons and polychlorinated biphenyl congeners by the gills of rainbow trout, were measured simultaneously with measurements of fish respiratory functions using a fish metabolic chamber. 110 refs., 19 figs., 7 tabs.

22599 (DOE-RW–89.066) **Studies of environmental radioactivity in Cumbria - Pt. 18: Plutonium and americium behaviour in Cumbrian near-shore waters.** McKay, W.A. (UKAEA Harwell Lab. (UK). Environmental and Medical Science Div.); Walker, M.I. Department of the Environment, London (UK). Apr 1989. 34p. (AERE-R–13441). Order Number DE90619474. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Final report.

A small fraction of the radionuclides discharged into coastal waters is blown back onto land in seaspray. Man is exposed directly through inhalation of the spray and indirectly via inhalation of resuspended soil and consumption of food stuffs. Sea to land transfer is most readily observed in Cumbria, and for the actinides plutonium and americium, where doses at the μSv year^{-1} level result. Another exposure route for some members of the population of the Cumbrian coast is the ingestion of actinides in seafood, particularly in winkles. In predicting the magnitude of sea to land transfer and uptake in seafood and their radiological consequence in the short and long term, some understanding of the processes controlling radionuclide levels in the adjacent near-shore waters is necessary. A recent study of Pu and Am concentrations in the coastal waters near Sellafield, Cumbria is described and discussed in this report. The results suggest that the actinides remain available for sea-to-land transfer in these near-shore waters for more than 6 years following their discharge from Sellafield. During this time, variations in suspended particulate loadings appear to be the most important influence on the seawater concentration. (author).

22600 (GKSS–89/E/25) **Small scale patches of suspended matter and phytoplankton in the Elbe river estuary, German Bight and tidal flats.** Doerffer, R. (GKSS-Forschungszentrum Geesthacht GmbH, Geesthacht-Tesperhude (Germany, F.R.)); Fischer, J.; Stoessel, M.; Brockmann, C.; Grassl, H. GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.). 1989. 11p. Available from Special print from Adv. Space Res. (1989) v. 9(1) p. 191-200.

Thematic mapper and ship data has been used to study small scale features in coastal waters of the North Sea. Three independent pieces of informations from all 7 TM channels were found with factor analysis: suspended matter concentration, atmospheric scattering and sea surface temperature. Near surface suspended matter concentrations may be detected within a factor of 2. For the required atmospheric correction the signal-to-noise ratio of the channels 5 and 7 has to be improved by averaging over 25 x 25 pixels. Thus TM allows to monitor aerosol optical depth and aerosol type over cloudfree water surfaces. Sea surface temperature is retrievable with an absolute accuracy of 1.0 K as long as radiosonde data are available for the correction of atmospheric effects, while relative temperature variations of 0.5 K are detectable. The patchiness of suspended matter and its relation to underwater topography was analysed with auto- and crosscorrelation: horizontal lengths, where the suspended matter concentration of single pixels are significantly correlated either with each another or with water depth, are < 800 m. (orig.).

22601 (GKSS–89/E/26) **Strontium-90 and cesium-137 in the Elbe river before and after the Chernobyl accident.** Wilken, R.D.; Diehl, R. GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.). 1989. 18p. (In German). Available from Special print from Vom Wasser, VCH Verlagsges. (1989) v. 72 p. 65-81.

Sr-90 and Cs-137 were analysed in monthly mixed samples at four stations in the Elbe river. The average Sr-90 concentration before the Chernobyl accident in the unfiltered water was approximately 0.015 Bq/l, increasing during June 1986 to 0.05 Bq/l. The average Cs-137 concentration was about 0.001 Bq/l in the inner estuary; due to emissions from reprocessing plants in Great Britain and France the concentration in the outer estuary was about a factor of 10 higher. The Cs-137 concentration was increased by the Chernobyl emissions to 0.1-0.5 Bq/l from May to July 1986, and is now again in the range of the values measured before the accident. A rough estimate of the amounts transported into the North Sea from May to July 1986 are 150-300 GBq for Sr-90 and 500-2000 GBq for Cs-137. Since sampling for Cs-137 was probably not representative, this figure could be a factor of 2-5 higher. These values are small compared to the natural radioactivity of K-40, and to the amounts of Cs-137 emitted by the reprocessing plants in Sellafield/Windscale and La Hague. (orig.).

22602 (IAEA-R–4390-F) **Cycling of the main natural alpha emitters in the coastal marine environment: Final report for the period 1 March 1986 - 30 June 1989.** Bettencourt, A.O. Laboratorio Nacional de Engenharia e Tecnologia Industrial, Sacavem (Portugal). Dept. de Proteccao e Seguranca Radiologica; International Atomic Energy Agency, Vienna (Austria). Nov 1989. 12p. Order Number DE90617511. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

A suite of natural radionuclides including ^{210}Pb-^{210}Po was analysed in atmospheric deposition, seawater, suspended particulates and abyssal fauna from the NE Atlantic Ocean. Measurements of dry and wet atmospheric fallout show that most of the ^{210}Pb and ^{210}Po in surface seawater originates from atmospheric deposition. In surface seawater near Madeira, ^{210}Pb and ^{210}Po concentrations average 2.1±0.7 and 1.5±0.7 mBq l^{-1}, respectively. ^{210}Pb was in excess of ^{226}Ra in the upper mixed layer but below 500 m the ^{210}Pb/^{226}Ra ratio was less than 1 due to preferential scavenging of ^{210}Pb by particles. Seawater profiles of ^{210}Po and ^{210}Pb indicated a well-defined maximum of ^{210}Po between 250-500 m. Based on activity levels measured in water and suspended particulates in the Iberian and Porcupine abyssal basins, mean residence times of 5 y and 1 y were computed for soluble ^{210}Pb and ^{210}Po, respectively. A shorter residence time of 0.6 y was computed for the particles that scavenge both radionuclides. Analysis of a variety of abyssal organisms demonstrated a wide range in whole-body ^{210}Po concentrations with values varying between 38 Bq kg^{-1} (wet wt.) in ascidians to 174 Bq kg^{-1} wet in starfish. The lowest concentrations (0.37 Bq kg^{-1} wet) were found in the muscle of the rattail Coryphaenoides armatus. In mesopelagic fish muscle ^{210}Po concentrations ranged from 0.2 Bq kg^{-1} wet in Aphanopus carbo to 980 Bq kg^{-1}1 wet in the hatchet fish Argyropelecus aculeatus. In the hatchet fish a very high concentration of 7.9 kBq kg^{-1} wet in gonad results in a dose of 4.2 Sv y^{-1} to that organ. In general, the ^{210}Po concentrations measured in abyssal and mesopelagic species are similar to those which have been reported for coastal organisms.

22603 (LBL–28207) **Bare soil evaporation at Kesterson Reservoir, Merced County, California: Estimation by physical and chemical methods.** Zawislanski, P.T. Lawrence Berkeley Lab., CA (USA). Dec 1989. 195p. Sponsored by U.S. DOE Energy Research; U.S. Department of the Interior. DOE Contract AC03-76SF00098. 9-AA-20-07250. Order Number DE90008492. Available from NTIS, PC A10/MF A01 - OSTI; GPO Dep.

Soil and water contamination at Kesterson Reservoir, Merced County, California, by selenium and salts has been an environmental concern for several years. The complex speciation and transport paths of these contaminants in the soil system have been the subject of intense research. The potential for further salt and selenium redistribution in the soil profile due to evaporation, transpiration, and infiltration of water needs to be seriously considered in evaluating the present and future environmental risks. This research project was designed to focus on the process of bare soil evaporation as a likely mechanism for concentrating species at and near the soil surface. To that end, bare soil evaporation rates were measured directly in the field and estimated based on chemical changes in the soil system. The nature of the bare soil evaporation process was examined through empirical and numerical means. Based on changes in near-surface concentrations of salts and selenium over a twelve month period, predictions have been made for likely future changes in species distribution. 120 refs., 110 figs., 11 tabs.

22604 (MAFF-AEMR–21) **Radioactivity in surface and coastal waters of the British Isles, 1988.** Hunt, G.J. Ministry of Agriculture, Fisheries and Food, Lowestoft (UK). Directorate of Fisheries Research. 1989. 69p. Order Number DE90619475. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

This report presents the results of the aquatic environmental monitoring programme performed during 1988 by the Ministry of Agriculture, Fisheries and Food's (MAFF's) Directorate of Fisheries Research (DFR). Radioactivity measurements are made in aquatic organisms and environmental materials in the vicinity of nuclear establishments including BNFL, UKAEA, nuclear power stations operated by the electricity boards, defence establishments and Amersham International. A summary of estimated public radiation exposures in 1988, relating to liquid radioactive waste discharges from nuclear establishments is presented. (UK).

22605 (OME/WRB–88/3) **Chemical and biological data summary for Lake 222 outflow experiments (experimental lakes area) (May 1983).** Findeis, J.G.; Hall, R.J.; Coleman Taylor, M. Ontario Ministry of the Environment, Dorset, ON (Canada). Water Resources Branch. Nov 1988. 112p. (MICROLOG–90-01030). Available from PC Ontario Business Development Division, Hearst Block, 900 Bay St., Toronto, ON, CAN M7A 2E1; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1. Prices: PC N/C; MF $10 CAN.

The effects of short-term pH depressions on aquatic biota are poorly documented. This data report presents the physical, chemical, and biological data from an acidification experiment conducted on the outflow of Lake 222 in the Experimental Lakes Area of Northwestern Ontario, an area not normally exposed to such pH depressions. Samples were also collected from a lake outflow that has experienced long-term artificial pH depression (Lake 223) and one that has not been impacted in any way (Lake 224). A detailed description of the methods for the collection of the biotic data is also included.

22606 (ORNL/M–1030) **Mercury monitoring of water and sediment in Oak Ridge National Laboratory streams during 1989.** Taylor, F.G. Jr. Oak Ridge National Lab., TN (USA). Jan 1990. 29p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90008080. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

An assessment plan was implemented in compliance with the Clean Water Act and the Oak Ridge National Laboratory's (ORNL) National Pollutant Discharge Elimination System (NPDES) Permit to identify, locate, and minimize all sources of mercury contamination in ORNL discharges to the aquatic environment. This plan was designed to identify sources of mercury from past operations and spills through a review of file records and personal interviews. A network of monitoring and sampling stations, based on knowledge of mercury deposits in receiving streams, knowledge of mercury discharges from pipes to streams, and a review of chemical data from previous contaminant surveys, was established for sample collection. The plan was designed to assess the potential for mercury reaching surrounding streams and rivers by placement of sampling sites relative to potential contaminant movement from areas of deposition. This summary report describes the monitoring data for 1989, collected during the first and fourth quarters, while contrasting to the 1988 data. Based on 1988–1989 data, recommendations are proposed to eliminate those sample locations which have not provided quantitative evidence of mercury deposition. Sample locations near sources identified from the monitoring data will be retained in the sample network. 7 refs., 6 figs., 7 tabs.

22607 (ORNL/M–1086) **Biological effects of changes in surface water acid-base chemistry: State-of-Science/Technology report 13.** Baker, J.P.; Bernard, D.P.; Christensen, S.W.; Sale, M.J.; Freda, J.; Heltcher, K.; Rowe, L.; Scanion, P.; Stokes, P.; Suter, G. Oak Ridge National Lab., TN (USA). Jan 1990. 714p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90008392. Available from NTIS, PC A99/MF A01 - OSTI; GPO Dep.

This report has three primary objectives. These are to identify chemical variables and characteristics that influence the effects of acidification (and recovery) on aquatic biota, to summarize the effects of changes in surface water acid-base chemistry (acidification and recovery) on biological communities and processes describe procedures to be applied for the National Acid Precipitation Assessment Program (NAPAP) Integrated Assessment for quantifying the relationship between changes in acid-base chemistry and regional effects on fish communities. 990 refs., 172 figs., 100 tabs.

22608 (ORNL/TM–11010) **Particulate matter dynamics and phytoplankton seasonality in a reservoir embayment ecosystem.** Ford, C.J.; Kimmel, B.L.; Olsen, C.R. Oak Ridge National Lab., TN (USA). Dec 1989. 160p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90008079. Available from NTIS, PC A08/MF A01 - OSTI; GPO Dep.

Phytoplankton losses from the water column and the relationships among seasonal change, algal community structure, and the fate of particle-associated materials were investigated in the Walker Branch embayment of Melton Hill Reservoir, Anderson County Tennessee. Sinking and ascent rates of phytoplankton were measured using settling columns, and in situ particle removal by sinking was estimated using the naturally-occurring radionuclides Beryllium-7 and Lead-210. Changes in autochthonous phytoplankton assemblage composition, concentration and production reflected the seasonal aspects of suspended particle flux. Beryllium-7 removal rates corresponded with those of the predominant form of particulate matter, and differed greatly from removal rates of Lead-210. The rapid associated of particle-reactive materials with the predominant form of particulate matter following input events suggests that the seasonality of particulate matter is a central factor in the sorption, residence time and ultimate fate of particle-associated materials within aquatic ecosystems. 135 refs., 15 figs., 10 tabs.

22609 (PB–90-117045/XAB) **Data compilation to accompany residence times of Minnesota ground waters. Final report.** Alexander, S.C.; Alexander, E.C. Minnesota Univ., Minneapolis, MN (USA). Dept. of Geology and Geophysics. 13 Nov 1989. 54p. (REPT–1123). Available from NTIS, PC A04/MF A01.

Tritium, ^{14}C, and chemical analyses for 80 ground water samples from selected Minnesota aquifers indicate a range of residence times from a few days to tens of thousands of years. Significant nitrate contamination is confined to recent and mixed ground waters. Combined chemical/isotopic studies yield information that will be useful in the design of effective ground water protection plans in Minnesota.

22610 (PB–90-129651/XAB) **Quantity and quality of stormwater runoff recharged to the Floridan aquifer system through two drainage wells in the Orlando, Florida area.** German, E.R. Geological Survey, Reston, VA (USA). Water Resources Div. 1989. 57p. (USGS/WATER-SUPPLY PAPER–2344). Available from NTIS, PC A04/MF A01.

Library of Congress catalog card No. 88-600173.

Quantity and quality of inflow to two drainage wells in the Orlando, Fla., area were determined for the period April 1982 through March 1983. The wells, located at Lake Midget and at Park Lake, are used to control the lake levels during rainy periods. The lakes receive stormwater runoff from mixed residential-commercial areas of about 64 acres (Lake Midget) and 96 acres (Park Lake) and would frequently flood adjacent areas if the wells did not drain the excess stormwater. These lakes and wells are typical of stormwater drainage systems in the area.

22611 (PB–90-130113/XAB) **Ground-water contamination at an inactive coal- and oil-gasification plant site, Gas Works Park, Seattle, Washington. Water-resources investigations.** Turney, G.L.; Goerlitz, D.F. Geological Survey, Denver, CO (USA). Sep 1989. 38p. (USGS/WRI–88-4224). Available from NTIS, PC A03/MF A01.

Gas Works Park, in Seattle, Washington, is located on the site of a coal- and oil-gasification plant that ceased operation in 1956. During operation, many types of wastes, including coal, tar, and oil, accumulated on site. The park soil is presently (1986) contaminated with compounds such as polynuclear aromatic hydrocarbons, volatile organic compounds, trace metals, and cyanide. Analyses of water samples from a network of observation wells in the park indicate that these compounds are also present in the ground water. Polynuclear aromatic hydrocarbons and volatile organic compounds were identified in ground-water samples in concentrations as large as 200 milligrams per liter. Soluble, volatile, low-molecular-weight organic compounds are preferentially dissolved from the nonaqueous phase liquid into the ground water. Concentrations of organic contaminants in the soils may still remain large.

22612 (PB–90-130121/XAB) **Effects of three highway-runoff detention methods on water quality of the surficial aquifer system in central Florida. Water-resources investigations.** Schiffer, D.M. Geological Survey, Reston, VA (USA). Water Resources Div. 1989. 89p. (USGS/WRI–88-4170). Available from NTIS, PC A05/MF A01.

Water quality of the surficial aquifer system was evaluated at one exfiltration pipe, two ponds (detention and retention), and two swales in central Florida, representing three runoff detention methods, to detect any effects from infiltrating highway runoff. Concentrations of major ions, metals, and nutrients were measured in ground water and bottom sediments from 1984 through 1986. At each study area, constituent concentrations in ground water near the structure were compared to concentrations in ground water from an upgradient control site. Analysis of variance of the rank-converted water-quality data at the exfiltration pipe indicated that mean concentrations of 14 of 26 water-quality variables are significantly different among sampling locations (the pipe, unsaturated zone, saturated zone, and the control well). Only phosphorus is significantly higher in ground water near the pipe than in ground water at the control well. Results of the study indicate that natural processes occurring in soils attenuate inorganic constituents in runoff prior to reaching the receiving ground water.

22613 (PB–90-130709/XAB) **Contaminant loading to Puget Sound from two marinas. Puget Sound estuary program. Final report, June 1988-October 1988.** Crecelius, E.A.; Fortman, T.J.; Kiesser, S.L.; Apts, C.W.; Cotter, O.A. Battelle Ocean Sciences, Duxbury, MA (USA). Jul 1989. 67p. Available from NTIS, PC A04/MF A01.

Concentrations of Cu, Pb, Zn, PAH's, TBT and FC bacteria were measured in surface sediment, sediment-trap, and water-column samples at two marinas in Puget Sound during summer of 1988. Levels of contaminants inside the marinas were compared with levels outside. TBT had greatest elevation in marina sediments compared to reference sediments. Few of sediments exceeded Puget Sound AET sediment quality values but most did exceed PSDDA screening levels for in-water disposal of dredged sediment. All marinas estimated to contribute less than one percent of total mass loading of Cu, Pb and Zn to main basin of Puget Sound. Contribution of TBT may be much more significant if antifouling paints are the major source for Puget Sound.

22614 (PB–90-131483/XAB) **Mechanisms for stream corridor protection. Final report.** White, D.C.; Penosky, M.; Braden, J.B.; Mariner, R.D.; Dreher, D. Illinois Univ., Urbana, IL (USA). Aug 1989. 97p. Available from NTIS, PC A05/MF A01.

This report assesses the protection currently provided to stream corridors in Illinois and makes recommendations for improving that protection. In addition to a comprehensive survey of current state and federal activities, the study surveyed selected states in order to identify program or policy alternatives applicable to stream protection in Illinois. These areas included the development of stream classification systems, the involvement of local interests, planning for greenway or stream corridor systems, and educational activities which teach the ecology of streams to the public. These programs offer ideas and suggestions for the state of Illinois to follow in protecting its stream resources. Although Illinois presently has no policy that recognizes the singular values of stream corridors, many of the state activities surveyed took place within the context of a state protection policy.

22615 (PB–90-132648/XAB) **Determination of the toxicity, water-quality interactions, and biomagnification of selenium in aquatic food chains. Technical report for 15 August 1987-14 August 1989 (Final).** Maier, K.J.; Ogle, R.S.; Maier, K.A.R.; Williams, M.J.; Malchow, D. California Univ., Davis, CA (USA). Dept. of Land, Air, and Water Resources. 14 Aug 1989. 128p. Available from NTIS, PC A07/MF A01.

Ecological degradation of aquatic ecosystems associated with the presence of elevated concentrations of the trace element selenium has been of considerable scientific, governmental, and public concern. The increased flux of selenium into several aquatic ecosystems, due to anthropogenic activities, has resulted in death, teratogenesis, reproductive impairment and decreased populations in fish and waterfowl communities in the systems. Research is continuing on several investigations into the toxicity, bioaccumulation, transfer, and biotransformation of selenium in aquatic organisms and laboratory food chains. Initial studies were primarily concerned with the comparative acute and chronic toxicity, water-quality interactions, and toxicological interactions of several chemical species of selenium to a variety of aquatic organisms. Further research

was directed towards the biotransformation, transfer, and subsequent bioaccumulation of selenium in simplified laboratory aquatic food chains. Studies on the transfer, bioaccumulation, and toxicity of selenium from dietary sources to consumers were conducted. The development of methodology for determining and quantifying the biochemical speciation of selenium in aquatic organisms was initiated.

22616 (PB–90-135559/XAB) **Anaerobic dechlorination of 2,4-dichlorophenol in freshwater sediments in the presence of sulfate.** Kohring, G.W.; Zhang, X.; Wiegel, J. Georgia Univ., Athens, GA (USA). c Oct 1989. 5p. Available from NTIS, PC A01/MF A01.

Pub. in Applied and Environmental Microbiology, Vol. 55, No. 10, 2735-2737(Oct 1989). See also PB–89-197495.

In the presence of added sulfate, 2,4-dichlorophenol and 4-chlorophenol were transformed stoichiometrically to 4-chlorophenol and phenol, respectively, in anaerobic freshwater lake sediments between 18 and 40 C. The concomitantly occurring sulfate reduction reduced the initial sulfate concentration from 25 mM to about 6 to 8 mM and depressed methane formation.

22617 (PB–90-136201/XAB) **Health assessment for Woodlands Route 72 Dump, Woodland Township, Burlington County, New Jersey, Region 2. Cerclis No. NJD980505879. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 19 Jan 1989. 7p. Available from NTIS, PC A02/MF A01.

The Woodland Route 72 Dump site is on the National Priorities List. The approximately 12-acre site operated during the early 1950s until 1962. Wastes were either buried or burned. The major environmental contamination on-site consists of benzoic acid (64 ppm), dibenzofuran (5.3 ppm), bis(2-ethylhexyl)phthalate (460 ppm), 1,4-dichlorobenzene (3.7 ppm), DDT (1,400 ppm), barium (606 ppm). chromium (1,504 ppm), lead (1,532 ppm), nickel (415 ppm), and mercury (2.3 ppm) in surface waste. The site is considered to be of potential public health concern because of the risk to human health caused by the possibility of exposure to hazardous substances via contaminated ground water and soil.

22618 (PB–90-137001/XAB) **Health assessment for Beachwood Borough and Berkeley Township National Priorities List (NPL) Site, Ocean County, New Jersey, Region 2. CERCLIS No. NJD980654123. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 17 Apr 1989. 14p. Available from NTIS, PC A03/MF A01.

The Beachwood Borough and Berkeley Township National Priorities List Site is located in Ocean County, New Jersey. A portion of the nearby population is exposed to generally low to moderately high levels of lead, copper, and manganese contamination by the ingestion of water. The sources of manganese are still under question and further sampling is required to define these sources. Lead and copper levels are most likely related to the naturally occurring acidic and corrosive ground waters which leach the metals from the household plumbing, and in certain instances, the serving wells. Currently, there appears to be a small segment of the area population that may be exposed to moderately high concentrations of lead in their potable water (0.7 mg/l). Lead contamination of potable water supplies is of public health concern. High concentrations of manganese may have health implications. The manganese concentrations that were found (0.617 mg/l maximum) relate mainly to the aesthetic qualities of the water rather than to public health.

22619 (PB–90-137118/XAB) **Health assessment for Bog Creek Farm Site (BCFS) National Priorities List (NPL) site, Howell Township, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD063157150. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 10 Apr 1989. 15p. Available from NTIS, PC A03/MF A01.

The Bog Creek Farm Site, located in a rural area of Howell Township, Monmouth County, New Jersey, is on the National Priorities List. In 1973 and 1974, various wastes were reportedly dumped at the site, including lacquer thinners, paint solvents and resins, disinfectants, animal carcasses, and residential debris. Sampling and analysis of on-site and off-site ground water, surface water, and sediments and of on-site waste and soil revealed several contaminants, primarily volatile organic compounds (VOCs), semi-volatile organic compounds, and heavy metals. Site contamination appears to be greatest immediately adjacent to an on-site waste-disposal trench. A potential public health threat exists from dermal absorption, ingestion, or inhalation of contamination from ground water, surface water, sediment, waste, and soil.

22620 (PB–90-137134/XAB) **Health assessment for Burnt Fly Bog National Priorities List Site, Marlboro, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD980504997. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 24 Aug 1988. 13p. Available from NTIS, PC A03/MF A01.

The Burnt Fly Bog site, a National Priorities List site, is located near Marlboro, Monmouth County, New Jersey in the fringe area of the New Jersey Pine Barrens. The major contaminants at the site are polychlorinated biphenyls (PCBs) and lead. Both of these contaminants have been found in all environmental media at the site. Exposure to contaminants may occur from contact with soil, sediment, water, air, or biota from the site. In order to protect the public health, access to contaminated areas should not be permitted except for properly-protected remedial workers. Because of the potential for ground-water contamination, private well owners surrounding the site should be advised to connect to the public water system. In addition, the consumption of game animals, berries, fish, and other biota from Burnt Fly Bog should be discouraged unless it can be determined that they are free of contamination.

22621 (PB–90-137159/XAB) **Health assessment for Chemical Control Corporation, Elizabeth, New Jersey, Region 2. CERCLIS No. NJD000607481. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 2 Apr 1987. 12p. Available from NTIS, PC A03/MF A01.

The Chemical Control Corporation Site is a National Priority List site located in an industrialized area in Union County. CCS was originally permitted by the State of New Jersey as a special waste facility to engage in reprocessing, reclaiming, recovering, blending, and treating hazardous waste by neutralization, chemical treatment, or incineration. The site has had a long history of violations and was closed as of March 1979. Subsurface soil and groundwater are contaminated with inorganic and organic chemicals. The volatile organic compounds appear consistently throughout the site. Ground-water results correlate well with the results of subsurface soil with the most contaminated ground-water samples collected from areas having extensive subsurface soil contamination. On-site contaminants have migrated off-site and have contributed somewhat to the contamination of the Elizabeth River.

22622 (PB–90-137167/XAB) **Health assessment for Chemical Leaman Tank Lines, Inc. (CLTL) NPL (National Oriorities List) site, Logan Township, Gloucester County, New Jersey, Region 2. CERCLIS No. NJD047321443. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 10 Apr 1989. 17p. Available from NTIS, PC A03/MF A01.

The Chemical Leaman Tank Lines, Inc. (CLTL) Site is a National Priorities List Site located in Logan Township, Gloucester County, New Jersey. CLTL is a common carrier of bulk chemical commodities, some of which are hazardous. CLTL previously used several rinse-water settling ponds and aeration lagoons as part of the cleaning and washing process for tank trailers. These ponds and lagoons have been removed; however, contamination from them has entered the underlying groundwater. On-site workers may be exposed to VOCs that are released to the ambient air from the on-site production well and from tank washing operations. Human exposure to on-site contaminants may also occur by inhalation and ingestion of contaminated subsurface soil particulates and dust during remedial or construction activities.

22623 (PB–90-137175/XAB) **Health assessment for Chemsol Inc., Piscataway, Middlesex County, New Jersey, Region 2. CERCLIS No. NJD980528889. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 10 Apr 1989. 8p. Available from NTIS, PC A02/MF A01.

The Chemsol Inc. Site is on the National Priorities List. The inactive 12-acre site is located in Piscataway (Middlesex County), New

Jersey. EPA suspects that 40 drums of chemical waste are buried on-site. Access to the site is restricted. Removal actions have not occurred. Preliminary on-site sampling results have identified various volatile organic compounds. They include chloroform, tetrachloroethylene, trichloroethylene, carbon tetrachloride, toluene, and benzene. Neither the sampling results nor the environmental media where the contaminants were found were reported. The site is considered to be of potential public health concern because of the risk to human health caused by the possibility of human exposure to hazardous substances.

22624 (PB–90-137183/XAB) **Health assessment for Ciba-Geigy National Priorities List (NPL) site, Dover Township, Ocean County, New Jersey, Region 2. CERCLIS No. NJD00150217. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 26 Oct 1988. 35p. Available from NTIS, PC A03/MF A01.

The Ciba-Geigy site is a National Priorities List site located in a heavily populated area of Dover Township, New Jersey, and is surrounded by a number of adjoining residential communities. Because of a diversity of past and present production and disposal operations, the site includes numerous on-site contaminant sources. Site contaminants consist of a variety of volatile organic compounds (VOCs), polycyclic aromatic hydrocarbons (PAHs), polychlorinated hydrocarbon insecticides, and heavy metals. Site contaminants have been identified in on-site surface soil and ground water, and in off-site sediment, surface water, ground water (including private residential wells), and air. The site is of public health concern because of the risk to human health caused by probable human exposure to hazardous substances at levels that may result in adverse human health effects over time.

22625 (PB–90-137191/XAB) **Health assessment for Combe Fill North Landfill, Mount Olive Township, New Jersey, Region 2. CERCLIS No. NJD980530596. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). May 1988. 10p. Available from NTIS, PC A02/MF A01.

The Combe Fill North Landfill National Priorities List Site is located in Mount Olive Township, Morris County, New Jersey. Volatile organic compound and heavy metal contamination was present in the soil, sediment, surface water, and ground water. The Record of Decision provides for a cap, a drainage system, a methane venting system, a fence around the site perimeter, and a monitoring program to ensure the effectiveness of the remedial action. The remedial action should be protective of public health once complete; in the interim, site access should be restricted to help prevent exposure to site contaminants.

22626 (PB–90-137209/XAB) **Health assessment for Combe Fill South Landfill, Morris County, New Jersey, Region 2. CERCLIS No. NJD094966611. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). May 1988. 14p. Available from NTIS, PC A03/MF A01.

The Combe Fill South Landfill National Priorities List Site is located on the township boundary between Chester and Washington Townships in Morris County, New Jersey. Until the remedial activities are complete, there is a potential public health threat from inhalation of gases produced within the waste pile, consumption of trout from Trout Brook, incidental ingestion and/or dermal absorption of surface water, dermal absorption and ingestion of ground water used in homes, and inhalation of volatile organic chemicals (VOCs) volatilized from contaminated ground water during household used.

22627 (PB–90-137233/XAB) **Health assessment for CPS/Madison Industries, Old Bridge Township, Middlesex County, New Jersey, Region 2. CERCLIS No. NJD002141190. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 19 Jan 1989. 8p. Available from NTIS, PC A02/MF A01.

The CPS/Madison Industries site is on the National Priorities List. CPS processes, treats, and stores organic chemicals and Madison Industries produces zinc compounds for fertilizers, pharmaceuticals, and food additives. The environmental contamination on-site consists of the following: methylene chloride, 1,1-dichloroethane, trans-1,2-dichloroethylene, 1,2-dichloroethane, trichloroethylene, benzene, chlorobenzene, toluene, cadmium, and lead in ground water. The site is considered to be of potential public health concern because of the risk to human health caused by the possibility of exposure to hazardous substances via contaminated ground water, surface water, sediment, and airborne particulate.

22628 (PB–90-137241/XAB) **Health assessment for Curcio Scrap Metal Yard, Saddle Brook Township, Bergen County, New Jersey, Region 2. CERCLIS No. NJD011717584. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 7 Jul 1988. 8p. Available from NTIS, PC A02/MF A01.

The Curcio Scrap Metal Yard is on the National Priorities List. The facility is an active scrap metal yard, which over a three-month period, purchased and scrapped 50 transformers, releasing polychlorinated biphenyls (PCBs) on-site. The predominant contaminants of concern are the polychlorinated biphenyls (PCBs), arachlor 1260, and arachlor 1248. EPA and the New Jersey Department of Environmental Protection have conducted only limited sampling to date. Contaminated or potentially contaminated environmental pathways associated with the site appear to be on-site and off-site soil, groundwater, and surface water, with further potential for food-chain contamination if the contaminants (PCBs) have reached nearby Schroeders Brook and accumulated in aquatic species used for human consumption. The site is considered to be of potential public health concern because of the risk to human health caused by the possibility of exposure to hazardous substances via the above-named human-exposure pathways.

22629 (PB–90-137258/XAB) **Health assessment for D'Imperio Property Site, Hamilton Township, New Jersey, Region 2. CERCLIS No. NJD980529416. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 11 Aug 1988. 11p. Available from NTIS, PC A03/MF A01.

The D'Imperio Property Site is an inactive National Priorities List waste disposal site consisting of two disposal areas, Sites 1 and 2. Site 1 consists mainly of partially buried metal drums, most of which have ruptured. Site 2 consists mainly of domestic refuse. The drums in Site 1 contained primarily various organic compounds, including solvents, which have contaminated the soil and ground water at the site. The available data indicated the residential wells were not contaminated by compounds from the site. However, more current data are needed to evaluate the present exposure potential.

22630 (PB–90-137266/XAB) **Health assessment for Derewal Chemical Company National Priorities List (NPL) site, Kingwood Township, Hunterdon County, New Jersey, Region 2. CERCLIS No. NJD980761373. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 20 Apr 1989. 15p. Available from NTIS, PC A03/MF A01.

The site is listed on the National Priorities List. The site (including Pinkerton Dump) is of potential public health concern because of the risk to human health resulting from possible exposure to hazardous substances at concentrations that may result in adverse health effects. Human exposure to lead and sodium (which may not be site-related) may occur, may be occurring, and may have occurred via ingestion of residential well water. Human exposure to lead in on-site surface soils may occur, may be occurring, or may have occurred via oral (ingestion) and inhalation exposure to soils and soil dusts.

22631 (PB–90-137274/XAB) **Health assessment for Diamond Alkali/80 Lister Avenue, Newark, New Jersey, Region 2. CERCLIS No. NJD980528996. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 5 Nov 1987. 19p. Available from NTIS, PC A03/MF A01.

The 3.4-acre site is located in the Ironbound Section in Newark, New Jersey. The major contaminant of concern is 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). Other contaminants of concern present on-site include benzene, chlorobenzene isomers, trichlorophenols, and DDT. On-site, and possibly off-site, soil TCDD concentrations pose a significant public health threat to workers involved in remedial site activities (and possibly nearby workers and area residents) and direct contact should not occur. Ground water beneath the site poses a potential public health

threat to users; use of the ground water for drinking, bathing, showering, washing, and cooking should not be permitted.

22632 (PB–90-137282/XAB) **Health assessment for Evor Phillips Leasing, Old Bridge Township, Middlesex County, New Jersey, Region 2. CERCLIS No. NJD980654222. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 10 Apr 1989. 8p. Available from NTIS, PC A02/MF A01.

The Evor Phillips Leasing (EPL) Site is on the National Priorities List. EPL has been reported to contain between 4,000 and 5,000 drums containing chemical wastes. Preliminary on-site sampling results have identified 1,2-dichloroethane (570 ppm in soil, 10 ppm in ground water, 4 ppm in private well), and trichloroethylene (197 ppm in soil, 358 ppb in ground water). Other substances identified in on-site soils include: ethylbenzene (1,590 ppm), toluene (3,240 ppm), phthalates (8 ppm in test pit waste). In addition, copper (200 ppb), nickel (69 ppb), and zinc (2,400 ppb) were detected in a private well. The site is considered to be of public health concern because of the risk to human health caused by the likelihood of human exposure to hazardous substances via ground water, soil, leachate, sediment, and surface water.

22633 (PB–90-137290/XAB) **Health assessment for Fairlawn Wellfield, Fairlawn, New Jersey, Region 2. CERCLIS No. NJD980654107. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 19 Jan 1989. 8p. Available from NTIS, PC A02/MF A01.

The Fairlawn Wellfield Site is on the National Priorities List. In 1978, volatile organic compounds were detected in four municipal supply wells located within and adjacent to the Fairlawn Industrial Park. The environmental contamination on-site (maximum concentrations reported) consists of benzene (250 ppm), ethylbenzene (230 ppm), trichloroethylene (1,000 ppm), and toluene (670 ppm) in soil; and methylene chloride (3 ppm), tetrachloroethylene (2 ppm), benzene (25 ppm), trichloroethylene (50 ppm), and 1,1,1-trichloroethane (2 ppm) in ground water. The site is considered to be of potential public health concern because of the risk to human health caused by the possibility of exposure to hazardous substances via ground water, surface water, and soil.

22634 (PB–90-137357/XAB) **Health assessment for Fort Dix Sanitary Landfill, Pemberton Township, New Jersey, Region 2. CERCLIS No. NJ2210020275. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 19 Dec 1988. 10p. Available from NTIS, PC A02/MF A01.

The 113-acre Fort Dix Sanitary Landfill is located in the southwest section of the U.S. Army Fort Dix Military Reservation near Pemberton Township, Burlington County, New Jersey. The Fort Dix Sanitary Landfill was in operation from 1950 until official closing on July 6, 1984. Soil, sediment, surface water, air, and groundwater samples were taken. Analyses of these samples show no contamination of public health concern in the air or soil at the landfill. Sediment and surface-water samples taken show no contamination of public health concern. No contaminants of public health concern were shown in the swamp sediment. No subsurface soil samples were taken in the landfill because of the explosive hazard associated with that type of operation at this site. The site is considered to be of potential public health concern because of the risk to human health caused by the possibility of exposure to hazardous substances via ingestion of surface water, biota, and ground water, and inhalation or direct dermal contact with surface water and ground water.

22635 (PB–90-137373/XAB) **Health assessment for Goose Farm National Priorities List (NPL) site, Plumsted Township, Ocean County, New Jersey, Region 2. CERCLIS No. NJD980530109. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 10 Apr 1989. 13p. Available from NTIS, PC A03/MF A01.

The Goose Farm National Priorities List Site is located in Plumsted Township, Ocean County, New Jersey. Both solid and liquid wastes in bulk, 55-gallon drums, 5-gallon pails, and lab packs were disposed at the site in a 15-foot deep pit from the mid-1940s to the mid-1970s. On-site and off-site media are contaminated with a variety of volatile organic compounds (VOCs), heavy metals, polychlorinated biphenyls, acid/base neutral compounds, and semi-volatile compounds. Environmental media that have been contaminated are surface water, ground water, and subsurface soils. On-site soil, contaminated with PCBs above 5 parts per million, is currently being excavated and disposed in an approved off-site facility. The selected remedial alternative should reduce the potential for further off-site migration of contaminants. Over time, the remediation should mitigate the contamination at the Goose Farm Site, thus protecting the health of the human population in the area.

22636 (PB–90-137399/XAB) **Health assessment for Hercules Inc., Gibbstown, Glocester County, New Jersey, Region 2. CERCLIS No. NJD002349058. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 10 Apr 1989. 7p. Available from NTIS, PC A02/MF A01.

The Hercules Inc. is on the National Priorities List. The company disposed of solvents, acids, and waste oils in two unlined disposal pits. Preliminary on-site ground-water sampling results have identified benzene (1.4 ppm), phenol (40 ppm), and isopropyl benzene (18 ppm). The site is considered to be of potential public health concern because of the risk to human health caused by the possibility of human exposure to hazardous substances. Further investigation is warranted.

22637 (PB–90-137415/XAB) **Health assessment for Kin-Buc Landfill, Edison Township, New Jersey, Region 2. CERCLIS No. NJD049860836. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 3 Jun 1987. 13p. Available from NTIS, PC A03/MF A01.

Kin-Buc Landfill, Edison Township, New Jersey, Received municipal and industrial wastes for 20 years. More than 100 toxic contaminants have been identified in the ground water, surface water, sediment, and air, with major pathways of release being ground water and surface transport of leachate, and volatilization into the air. The assessment appears to be based on data from many sources and the quality of the data cannot be verified.

22638 (PB–90-137423/XAB) **Health assessment for Lang Property National Priorities List (NPL) site, Pemberton Township, Burlington County, New Jersey, Region 2. CERCLIS No. NJD980505382. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 17 Apr 1989. 26p. Available from NTIS, PC A03/MF A01.

The Lang Property National Priorities List Site is located in Pemberton Township, Burlington County, New Jersey. Unauthorized disposal of hazardous wastes occurred on approximately two acres of the 40-acre site. The contaminant classes that were identified on the site are volatile organic compounds (VOCs), semi-volatile organic compounds (semi-VOCs), polynuclear aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs), pesticides, and metals. The contaminant classes of concern are PCBs, VOCs, and semi-VOCs for on-site ground water. VOCs is the contaminant class of concern for sediments and surface water. The on-site ground water is highly contaminated; at the maximum chemical concentrations detected, use of this water without treatment would pose a human health concern. The potential does exist for human exposure to ground water contaminants by ingestion, inhalation of volatilized VOCs from ground water, and dermal absorption. The surface soils are also highly contaminated and represent a current possible as well as future human health concern for trespassers, blueberry farm workers and harvesters, and construction and remedial workers.

22639 (PB–90-137449/XAB) **Health assessment for Lone Pine Landfill National Priorities List (NPL) site, Freehold, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD980505424. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 18 Apr 1989. 23p. Available from NTIS, PC A03/MF A01.

The Lone Pine Landfill National Priorities List site is in Monmouth County, New Jersey. The facility operated from 1959 to 1979 and received chemical, municipal, and septage wastes. The principal contaminants determined by monitoring are volatile organic compounds and metals. The site is of potential health concern because of the risk to human health resulting from possible exposure to hazardous substances at concentrations that may result in adverse health effects. Contaminants, principally volatile organic compounds, have been detected at levels of potential concern in

ground water on-site and immediately off-site, in soils on-site, in the air at the site perimeter under certain atmospheric conditions, and in surface water in the river. Ground water is the principal medium of concern because it is the source of potable water in the area. Surface water is also of concern because of the water-supply reservoir that will draw water from the river downstream.

22640 (PB–90-137456/XAB) **Health assessment for Matlack, Incorporated, Swedesboro, Gloucester County, New Jersey, Region 2. CERCLIS No. NJD043584101. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 19 Jan 1989. 8p. Available from NTIS, PC A02/MF A01.

The Matlack, Incorporated site, on the National Priorities List, is a tank cleaning and truck terminal that has been in operation since 1960. The environmental contamination on-site consists of total volatile organic hydrocarbons in ground water (11 ppb) and soil, including chloroform, tetrachloroethylene, 1,1,1-trichloroethane, trichloroethylene, xylenes, toluene, benzene, chlorinated benzenes, and methylene chloride. The site is considered to be of potential public health concern because of the risk to human health caused by the possibility of exposure to hazardous substances via contaminated groundwater.

22641 (PB–90-137464/XAB) **Health assessment for Mannheim Avenue Dump, Galloway Township, New Jersey, Region 2. CERCLIS No. NJD980654180. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 14 Nov 1988. 7p. Available from NTIS, PC A02/MF A01.

The Mannheim Avenue Dump site is on the National Priorities List. The two-acres site was used by Galloway Township and a local industry, Lenox China, for waste disposal during the 1960s and 1970s. On-site environmental contamination consists of lead (48,000 ppm), chromium (28 ppm), and non-specific petroleum hydrocarbons (530 ppm) in soil, and trichloroethylene (140 ppb), and zinc (51 ppb) in ground water monitoring wells. The site is considered to be of potential public health concern because of the risk to human health caused by the possibility to exposure to hazardous substances via migration of hazardous substances into ground water used for water supplies.

22642 (PB–90-137480/XAB) **Health assessment for Monroe Township Landfill, Monroe, New Jersey, Region 2. CERCLIS No. NJD980505671. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 10 Apr 1989. 7p. Available from NTIS, PC A02/MF A01.

The Monroe Township Landfill is on the National Priorities List. The 86-acre site is located in Monroe (Middlesex County), New Jersey. Preliminary on-site leachate sample results have identified various volatile organic compounds. They include toluene, vinyl chloride, 1,2-dichlorobenzene, and 1,4-dichlorobenzene. The site is considered to be of public health concern because of the risk to human health caused by the likelihood of human exposure to hazardous substances via direct contact.

22643 (PB–90-137498/XAB) **Health assessment for Montgomery Township Housing Development, Montgomery, New Jersey, Region 2. CERCLIS No. NJD980654164. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). Jul 1988. 13p. Available from NTIS, PC A03/MF A01.

The Montgomery Township Housing Development National Priorities List site is located on approximately 72 acres in Somerset County, New Jersey. In 1979 samples from private wells were taken and shown to be contaminated with high levels of trichloroethene (TCE) as well as other contaminants. Presently, the primary contaminants of concern are TCE and lead present in the private wells of the homes in the housing development. An emergency response action was requested to provide an interim alternate water source to those residences that warranted it.

22644 (PB–90-137514/XAB) **Health assessment for Nascolite Corporation, Millville, New Jersey, Region 2. CERCLIS No. NJD002362705. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 3 Jun 1987. 14p. Available from NTIS, PC A03/MF A01.

The Nascolite Site (NS) is an NPL site located in Millville (Cumberland County), in southern New Jersey. Methyl methacrylate and various other plasticizers have been identified. The volatile organic compounds (VOCs) identified on-site include benzene, toluene, ethylbenzene, xylene, cumene, n-propyl benzene, trimethylbenzene, n-butyl benzene, cyclopropyl benzene, trichloroethane, styrene, hexachlorobutadiene, 1,2-dichloroethane, 0-dichlorobenzene, naphthalene, trichloroethylene, sec-butyl benzene, 2,3-benzofuran, methylene chloride, 1,2-dichloropropane, and some 8 to 17 unidentified chemicals. NS is contaminated with significant concentrations of methyl methacrylate, other plasticizers, and VOCs, and represents a potential public health hazard to area residents and on-site workers during remedial efforts. In addition, significant gross alpha radiation has been detected.

22645 (PB–90-137522/XAB) **Health assessment for Naval Air Engineering Center, Lakehurst, Ocean County, New Jersey, Region 2. CERCLIS No. NJ7170023744. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 19 Jan 1989. 9p. Available from NTIS, PC A02/MF A01.

The Naval Air Engineering Center site is on the National Priorities List. On-site environmental contamination consists of lead, 1,1-dichloroethane, and trans-1,2-dichloroethylene in non-potable water wells; arsenic, lead, xylene, trichloroethylene, ethylbenzene, trimethyl benzene, and methylethyl benzene in ground water; zinc in surface water; fluoranthene, pyrene, and 1,2,4-trichlorobenzene in soil; and heavy metals in stream sediment. The site is considered to be of potential public health concern because of the risk to human health caused by the possibility of exposure to hazardous substances via contaminated ground water, soil, sediment, and surface water.

22646 (PB–90-137530/XAB) **Health assessment for Naval Weapons Station-Site A, Colts Neck, New Jersey, Region 2. CERCLIS No. NJ0170022172. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 15 Nov 1988. 7p. Available from NTIS, PC A02/MF A01.

The Naval Weapons Station site is listed on the National Priorities List. The site is an active Naval facility which handles, stores, renovates, and ships munitions. The environmental contamination consists of lead, zinc, and titanium. There are not enough data and information to evaluate the site for its public health implications. The site is considered to be of potential public health concern because of the risk to human health caused by the possibility of exposure to hazardous substances.

22647 (PB–90-137548/XAB) **Health assessment for N.L. Industries, Inc., Pedricktown, New Jersey, Region 2. CERCLIS No. NJD061843249. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 10 Apr 1989. 8p. Available from NTIS, PC A02/MF A01.

The N.L. Industries, Inc. Site (NLI) is on the National Priorities List. The 46-acre site is located in Pedricktown (Salem County), New Jersey. The site is a former secondary lead smelting facility which operated from 1972 to 1984. In addition, a closed landfill exists on-site that contains process wastes (slag and rubber materials) from the plant and lead contaminated soils that were excavated from the facility grounds. Preliminary on-site sampling results have identified lead (36 to 83,600 ppm in soil, 7.5 ppm in surface water, 0.01 to 11 ppm in ground water). In addition, arsenic and cadmium was identified along with selenium (1 ppm) in on-site ground water. Arsenic and cadmium were reported to be at concentrations that exceed standards. The site is considered to be of potential public health concern because of the risk to human health caused by the possibility of human exposure to hazardous substances. Direct contact and incidental ingestion of contaminated soil and surface water by area residents is the most likely route of exposure.

22648 (PB–90-137571/XAB) **Health assessment for PJP Landfill, Judson County, Jersey City, New Jersey, Region 2. CERCLIS No. NJD980505648. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 11 Oct 1988. 8p. Available from NTIS, PC A02/MF A01.

The PJP Landfill site is listed on the National Priorities List. The approximately 87-acre site may have been used since 1968 to dispose of an unknown quantity of chemical and industrial wastes. The State certified the landfill to receive hazardous wastes in 1971. The site presently is closed. On-site environmental contamination

consists of chromium (40 ppb), phenols (33,000 ppb), various pesticides (up to 7,000 ppb), and volatile organics (up to 9,000 ppb) in ground water; and benzene (27 ppb), chlorobenzene (33 ppb), and lead (500 ppb) in leachate in the ditch. The site is considered to be of potential public health concern because of the risk to human health caused by the possibility of exposure to hazardous substances via contaminated surface water.

22649 (PB–90-137597/XAB) **Health assessment for Renora Site, Edison Township (bonhantown), New Jersey, Region 2. CERCLIS No. NJD070415005. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 10 Apr 1989. 13p. Available from NTIS, PC A03/MF A01.

Renora Incorporated, an approximately 1-acre site on the National Priorities List, began operations in 1978 as a licensed collector/hauler of waste oil and operated until 1982. During this time, Renora also transported and accepted hazardous substances for transfer, storage, and blending. On-site surficial soils were contaminated with polychlorinated biphenyls, polynuclear aromatic hydrocarbons, and lesser quantities of volatile organic compounds (VOCs) and metals. The shallow groundwater was contaminated with chloroethane and metals. The surface water and sediments were contaminated with metals and VOCs. The site is of public health concern because there is potential for exposure to hazardous substances at concentrations of health concern.

22650 (PB–90-137605/XAB) **Health assessment for Ringwood Mines/Landfill National Priorities List (NPL) site, Ringwood, Passaic County, New Jersey, Region 2. CERCLIS No. NJD980529739. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 14 Apr 1989. 14p. Available from NTIS, PC A03/MF A01.

The Ringwood Mines/Landfill located in Ringwood, Passaic County, New Jersey is on the National Priorities List. Magnetite mines were operated on the site as early as the 1700s and disposal of wastes at the site has occurred since the 1960s. Municipal refuse and industrial wastes were deposited in an on-site landfill. The primary contaminants found at the site are arsenic, cadmium, lead, and methylene chloride. The site poses a potential public health concern because of the risk to human health that could result from possible exposure to hazardous substances via contaminated soils and ground water.

22651 (PB–90-137613/XAB) **Health assessment for Rockaway Borough Well Field National Priorities List (NPL) site, Borough of Rockaway, Morris County, New Jersey, Region 2. CERCLIS No. NJD980654115. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 17 Apr 1989. 15p. Available from NTIS, PC A03/MF A01.

The Rockaway Borough Well Field is a National Priorities List site located in the Borough of Rockaway, Morris County, New Jersey. Because of yet unidentified source(s) of trichloroethylene (TCE) and tetrachloroethylene (PCE) in ground water, municipal wells of the Borough of Rockaway have been contaminated sometime prior to 1980, when well water was found to contain high concentrations of these volatile organic compounds. The site is of potential public health concern because of the risk to human health resulting from possible exposure to hazardous substances at concentrations that may result in adverse health effects. Human exposure to elevated concentrations of TCE and/or PCE may occur, be occurring, or have occurred via oral, dermal, or inhalation exposure to contaminated municipal drinking water (only in the unlikely event that breakthrough occurs) or private well water.

22652 (PB–90-137621/XAB) **Health assessment for Rocky Hill Municipal Wellfield, Rocky Hill, New Jersey, Region 2. CERCLIS No. NJD980654156. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). Aug 1988. 15p. Available from NTIS, PC A03/MF A01.

The Rocy Hill Municipal Wellfield (RHMW) National Priorities List site is located in Somerset County, New Jersey. In 1979 samples from the RHMW wells were shown to be contaminated with high levels of trichloroethene (TCE) as well as other volatile organic compounds (VOCs). Presently, the municipal well which is still in operation (Well 2) is provided with an air-stripping unit, installed in 1983. The Record of Decision for the second operable unit (i.e., ground water treatment) selected a remedy that includes: extraction of ground water from the surficial aquifer, provision of municipal water to the remaining private well users, sealing of abandoned private wells, and provision of a ground water monitoring system. The remedy should be adequate to address exposure to ground water contamination; however, exposure of area residents to airborne VOCs, volatilizing from contaminated soil or ground water, is still a potential health concern at the site.

22653 (PB–90-137639/XAB) **Health assessment for Sayreville Landfill, Middlesex County, Sayreville, New Jersey, Region 2. CERCLIS No. NJD980505754. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 11 Oct 1988. 8p. Available from NTIS, PC A02/MF A01.

The Sayreville Landfill site is on the National Priorities List. The Sayreville Landfill was licensed to receive municipal waste and light industrial waste; however, allegedly, hazardous waste also was disposed of during operations and after closure in 1977. On-site contamination consists of pentachlorophenol and p-ethyl toluene (concentration not reported), in drums which were removed from the site in 1982; benzene (110 ppb), toluene (105 ppb), arsenic (11,500 ppb) and chloroform (87 ppb) in soil; iron (596,000 ppb), manganese (2,700 ppb), phenol (2,300 ppb), 2-methyl phenol (3,100 ppb), and benzene (200 ppb) in ground water. The site is considered to be of potential public health concern because of the possibility of exposure to hazardous substances via surface water (and ingestion of contaminated aquatic organisms) and possibly ground water.

22654 (PB–90-137654/XAB) **Health assessment for Sharkey Landfill, Troy Hills, New Jersey, Region 2. CERCLIS No. NJD980505762. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 7 Dec 1988. 13p. Available from NTIS, PC A03/MF A01.

The Sharkey Landfill is a National Priorities List site located in the Townships of Parsippany-Troy Hills and East Hanover, Morris County, New Jersey. The total landfill area is approximately 90 acres and is divided into 4 separate sections. The landfill began operation in 1945 accepting municipal wastes from several surrounding counties and some hazardous and/or toxic materials. Records indicated these materials included approximately 100,000 gallons of various volatile organic compounds (VOCs). The landfill also accepted wastes from sewage treatment plants. Data from monitoring wells on-site indicated the ground water in the shallow aquifer is contaminated with VOCs and metals at concentrations above the drinking-water standards. Sharkey Landfill is of potential health concern because there is potential for contaminant migration off-site in ground water and surface water.

22655 (PB–90-137662/XAB) **Health assessment for Shieldalloy Corporation, Newfield Borough, Gloucester County, New Jersey, Region 2. CERCLIS No. NJD002365930. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 15 Nov 1988. 8p. Available from NTIS, PC A02/MF A01.

The Shieldalloy Corporation site is on the National Priorities List. The approximately 62-acre site is an active specialty plant making chromium alloy products. Past disposal practices have resulted in extensive chromium contamination of the ground water. On-site contamination consists of hexavalent chromium (55 ppm) in ground water; and chromium in sludge (20%). Off-site contamination consists of hexavalent chromium in ground water (33 ppm) and surface water (35 ppm), and trichloroethylene (3 ppm) in surface water. The trichloroethylene may not be site related. Low-level radioactive wastes have been reported to be on-site, but no supporting documentation was presented. The Company is licensed by the Nuclear Regulatory Commission. The site is considered to be of potential public health concern because of the risk to human health caused by the possibility of exposure to hazardous substances via ground water, surface water, soils, sludges, airborne particulate, and ingestion of contaminated fish.

22656 (PB–90-137712/XAB) **Health assessment for Tabernacle Drum Dump National Priorities List (NPL) site, Tabernacle Township, Burlington County, New Jersey, Region 2. CERCLIS No. NJD980761357. Final report.** Agency for Toxic

Substances and Disease Registry, Atlanta, GA (USA). 26 Oct 1988. 20p. Available from NTIS, PC A03/MF A01.

The Tabernacle Drum Dump NPL Site is located in Burlington County, New Jersey. The site groundwater is contaminated with volatile organic compounds (VOCs), primarily 1,1,1-trichloroethane (TCA) and inorganic chemicals, primarily lead, cadmium, and chromium. Levels of 1,1-dichloroethene (DCE) were found in two monitoring wells. The site surface soils are primarily contaminated with chromium, lead and cyanide. The Tabernacle Drum Dump site poses a potential public health threat. If the site remains unremediated, the levels of TCA, DCE, cadmium, chromium, and lead found in the on-site groundwater may further increase the contamination of residential wells. Populations at risk of exposure are trespassers, children that play on the site, construction and remedial workers, and nearby residents.

22657 (PB–90-137787/XAB) **Health assessment for Woodland Route 532 Dump, Woodland Township, Burlington County, New Jersey, Region 2. CERCLIS No. NJD980505887. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 15 Nov 1988. 7p. Available from NTIS, PC A02/MF A01.

The Woodland Route 532 Dump site is on the National Priorities List. The 35-acre facility was used by several chemical manufacturers in the 1950s and early 1960s for open burning, dumping, and burial of drummed chemical wastes. On-site contamination consists of pentachlorophenol (182 ppb) in ground water. Although air sampling has not been conducted, it was reported that levels of chemicals in the air were judged by investigators to pose a respiratory hazard during site-invasive sampling procedures. The site is considered to be of potential public health concern because of the risk to human health caused by the possibility of exposure to hazardous substances via contact with surface materials on-site.

22658 (PB–90-138751/XAB) **Health assessment for Islip Sanitary Landfill, Suffolk County, New York, Region 2. CERCLIS No. NYD980506901. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 29 Jun 1988. 8p. Available from NTIS, PC A02/MF A01.

The Islip Sanitary landfill 40-acre site has been in operation since 1927, accepting municipal and industrial wastes. The site continues to operate. The site is unlined, and only partially capped. Environmental sampling conducted to date indicates that the contaminants of immediate concern are predominately volatile organic chemicals (VOCs) in ground water and perhaps air. The VOCs present in one or more environmental media include trichloroethylene (TCE); tetrachloroethylene (perchloroethylene (PCE)); trichloroethane (TCA); vinyl chloride; and methylene chloride. Contaminated or potentially contaminated environmental pathways associated with the site which are of greatest public health importance are on-site and off-site ground water, and possibly air. The site is considered to be of potential public health concern because of the risk to human health caused by the possibility of exposure to hazardous substances. While it does not appear that a human population is currently exposed to site contaminants, the potential for such exposure remains and should be carefully monitored.

22659 (PB–90-138769/XAB) **Health assessment for Hudson River PCB (polychlorinated biphenyl) NPL (National Priorities List) site, State of New York, Region 2. CERCLIS No. NYD980763841. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 17 Apr 1989. 20p. Available from NTIS, PC A03/MF A01.

Hudson River PCB (polychlorinated biphenyls) is a National Priorities List site located in the State of New York. Because of the past disposal of PCBs in the Hudson River, surface water, sediment, and fish from the Upper and Lower Hudson River are contaminated with elevated concentrations of PCBs. The site is of potential public health concern because of the risk to human health resulting from possible exposure to hazardous substances at concentrations that may result in adverse health effects. Human exposure to PCB-contaminated fish or other consumable aquatic organisms from the Hudson River may occur and/or may be occurring via oral exposure (ingestion). Possible inhalation of volatilized PCBs, airborne PCB-contaminated dusts, as well as dermal contact with PCB-contaminated sediment are also of potential concern to human health.

22660 (PB–90-138793/XAB) **Health assessment for Hyde Park Landfill National Priorities List (NPL) site, Niagara Falls, New York, Region 2. CERCLIS No. NYD000831644. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 7 Feb 1989. 19p. Available from NTIS, PC A03/MF A01.

The Hyde Park Landfill National Priorities List Site was used by Hooker Chemical and Plastic Corporation, now Occidental Chemical Corporation, to dispose of approximately 80,000 tons of waste from 1953 to 1975. Significant amounts of 2,3,7,8-tetrachlorodibenzo-p-dioxin is believed to be in the landfill. Site-related contaminants have been detected in the overburden and bedrock aquifers. Analyses of samples taken from ground water seeps at the Niagara Gorge Face also show site-related contaminants. Leachate from the landfill appears to have entered Bloody Run Creek. Sediment sample analyses from the creek show site-related contaminants. The 1985 U.S. Environmental Protection Agency Enforcement Decision Document outlines remedial activities to be conducted at the site. The site without remediation is of potential public health concern because of the risk to human health resulting from possible exposure to hazardous substances at concentrations that may result in adverse health effects.

22661 (PB–90-138801/XAB) **Health assessment for Hooker Chemical (102nd Street Landfill), Niagara Falls, New York, Region 2. CERCLIS No. NYD980506810. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). Jun 1989. 10p. Available from NTIS, PC A02/MF A01.

The 102nd Street Landfill is two sites that comprise 22 acres. Occidental Chemical Corporation (OCC) and its predecessor, the Oldbury Electrochemical Company, deposited approximately 23,500 tons of mixed organic solvents, organic and inorganic phosphates, and related chemicals. Included in the site are approximately 300 tons of hexachlorocyclohexane process cake, including lindane. In addition, brine sludge, fly ash, electrochemical cell parts and related equipment in unknown quantities were dumped at the site. On-site contamination of the 102nd Street Landfill includes soils contaminated with non-aqueous phase liquids on both portions of the Landfill. Off-site contamination, based on current studies, results from contaminated ground-water leaching into the Niagara River which causes contamination of the river water, sediments, and aquatic organisms, including fish. The 102nd Street Landfill continues to represent a potential public health threat.

22662 (PB–90-138819/XAB) **Health assessment for Hertel Landfill Inc., Ulster County, Plattekill, New York, Region 2. CERCLIS No. NYD980780779. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). 30 Jun 1989. 11p. Available from NTIS, PC A03/MF A01.

Environmental Landfills Incorporated, formerly the Hertel Landfill Site, is on the National Priorities List. The site operated between 1963 and 1977 as a landfill receiving both residential and industrial wastes. Only limited sampling has been conducted on-site. Contaminants found in monitoring wells at the site include methylene chloride, trichloroethylene, 1,1-dichloroethane, and elevated levels of metals. Private residential wells downgradient of the site have been confirmed to contain 1,1,1-trichloroethane and benzene. Based on the available information, the site poses a potential public health threat to adjacent residences and potential human exposure to people on and in the vicinity of the site.

22663 (PB–90-138827/XAB) **Health assessment for Haviland Complex National Priorities List (NPL) site, Hyde Park, New York, Region 2. CERCLIS No. NYD980785661. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 22 Aug 1988. 19p. Available from NTIS, PC A03/MF A01.

The Haviland Complex National Priorities List site is located near Hyde Park, New York. Discharges from septic leach fields have contaminated the local ground water with dichlorobenzene, tetrachloroethylene, trichloroethylene, trans-1,2-dichloroethylene, and vinyl chloride. The local groundwater was used for drinking water by the on-site population from the late 1960s through 1983. It is believed that the residences with affected wells have used bottled

or treated water for potable purposes since 1983 and continue to use the ground water for sanitation purposes. The Haviland site poses a threat to public health as a result of the direct ingestion, dermal contact, and inhalation of the contaminants in the ground water. The Record of Decision signed on September 30, 1987 requires that the aquifer be restored to drinking water quality, the affected and potentially affected residents be connected to the Harbourd Hills water distribution system, and the local septic disposal systems be cleaned.

22664 (PB–90-138835/XAB) **Health assessment for Griffiss Air Force Base NPL (National Priorities List) site, Rome, Oneida County, New York, Region 2. CERCLIS No. NY4571924451. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 9 Jun 1988. 21p. Available from NTIS, PC A03/MF A01.

The Griffiss Air Force Base National Priorities List Site is located near the City of Rome, New York. Most of these sites have not been sufficiently investigated at this time for a complete determination of their possible health effects. Residential wells south of Griffiss Air Force Base are contaminated with volatile organic compounds: trichloroethene and 1,1,2,2-tetrachloroethane. The measured concentrations of trichloroethene and 1,1,2,2-tetrachloroethane, to date, are below levels of concern. The site is of potential public health concern because of the risk to human health that could result from possible future exposure to hazardous substances at levels that may result in adverse health effects over time.

22665 (PB–90-138843/XAB) **Health assessment for Goldisc Recording, Holbrook, New York, Region 2. CERCLIS No. NYD980768717. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). Jun 1988. 13p. Available from NTIS, PC A03/MF A01.

Goldisc Recording is listed on the National Priorities List. Dichloroethanes, 1,1,1,1-trichloroethane, di-n-butyl phthalate, tetrachloroethylene, trichloroethylene, chromium, and lead are the contaminants of concern in the on-site monitoring wells. The site represents a potential public health threat. Workers on-site are potentially exposed to contaminated surficial soils. Monitoring of public water supplies and identification of private water supplies are needed to ensure safe drinking water for area residents.

22666 (PB–90-138850/XAB) **Health assessment for Genzale Plating, Franklin Square, New York, Region 2. CERCLIS No. NYD002050110. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). Jun 1989. 10p. Available from NTIS, PC A02/MF A01.

The Genzale Plating Site is located in Franklin Square, Nassau County. Prior to 1981, process waste waters containing high concentrations of heavy metals and possibly some solvents were discharged into several leaching pits behind the facility. Limited cleanup of surficial contaminants (soils/sludge removal) has been performed. Environmental sampling at the site has been limited to inorganic analyses of the leachate pits and ground water. The waste water is contaminated by high concentrations of several metals, most notably nickel at 680 mg/L and chromium(+6) at 51 mg/L. Contaminated or potentially contaminated environmental pathways associated with this site are on-site soil, sludge and waste water, on-site and off-site ground water. If volatile organic chemicals are present at the site, both air and soil gas could represent pathways for environmental contamination. The site represents a potential public health threat. Analysis of soils and ground water on-site for volatile organic chemicals is necessary. Routine monitoring of public water-supply wells will reveal any impacts from the site. Any private wells still in use should be located and tested.

22667 (PB–90-138868/XAB) **Health assessment for General Motors Central Foundry, St. Lawrence County, Massena, New York, Region 2. CERCLIS No. NYD091972554. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). 30 Jun 1989. 16p. Available from NTIS, PC A03/MF A01.

The General Motors Central Foundry Division is an aluminum casting plant on 270 acres located on the south bank of the St. Lawrence River in Massena, New York. The plant has been in operation since 1959. Polychlorinated biphenyls (PCBs) were used in the hydraulic fluids for die-casting machines from 1968-1973. Sludges containing PCBs were landfilled in on-site disposal pits, in an industrial landfill, and in several lagoons on-site. Soils, ground water and river sediments are known to be contaminated. PCB contaminated sludges and soils are estimated to be in excess of 370,000 cubic yards at concentrations greater than 25 mg/kg (dry weight). Ground water and surface water standards for PCBs were exceeded. Potential environmental pathways include contaminated ground water, surface water, soil, and air. The consumption of contaminated fish and wildlife of the food chain is particularly significant at this site because of the close proximity of the Mohawk Indian Reservation, whose residents include large amounts of local fish and wildlife in their diets.

22668 (PB–90-138876/XAB) **Health assessment for Ge-Moreau, South Glen Falls, New York, Region 2. CERCLIS No. NYD980052335. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 13 Jun 1983. 16p. Available from NTIS, PC A03/MF A01.

Approximately 75 drums of liquid wastes containing PCBs were dumped from 1958 to 1968 into an evaporative pit on the G.E.-Moreau Hazardous Waste Site, Glens Falls, Saratoga County, New York. As a result of considerable local and State pressure, G.E. in September 1980 agreed with the State to fund remedial actions at the Moreau/Caputo site and to monitor and maintain the site with security for 30 years after completion of the remedial work. The levels of TCE and other organic compounds are sufficiently high in the local ground-water resources to pose an imminent and insignificant hazard to certain well-water users. Remedial measures need to be implemented immediately to safeguard the public health of any well-water users where levels exceed acute and chronic health guidelines. Past ambient air samples in the pit area revealed exceedingly high values. Since inhalation is a major route of exposure, air sampling in areas where residents and workers are at risk of exposure should be performed, with an adequate sampling strategy based on air-transport modeling. In April, 1979, EPA reported soil PCB levels near the evaporative lagoon as high as 34,000 ppm Arochlor 1016 and 1622 ppm Arochlor 1254. This sampling was done after the 1st cleanup but before further soil was removed in 2 further cleanup efforts. Sampling on-site should be repeated now to see what the residual levels are. On-site soil should also be sampled for other contaminants, including those found in ground water plus heavy metals. It may be necessary to implement immediate remedial measures to safeguard human health.

22669 (PB–90-138884/XAB) **Health assessment for Fulton Terminals Site, Fulton, New York, Region 2. CERCLIS No. NYD980593099. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 21 Jun 1988. 13p. Available from NTIS, PC A03/MF A01.

The Fulton Terminals Site is located in an urban area near the extreme northern edge of Fulton, New York, within 50 feet of the Oswego River. The site served as an oil, asphalt, and chemical storage area from 1936-1977. Sampling and analysis of site soil, sediments, ground water, and surface water revealed a number of Hazardous Substance List contaminants including arsenic, benzene, lead, polychlorinated biphenyls (PCBs), and xylene. The identified pathways for contaminant migration include ground water, surface water, soil, air, and bioaccumulation. Under current conditions the site poses as a potential threat to human health in the event of unauthorized site entry, ingestion of contaminated groundwater, and use of the Oswego River adjacent to the site for recreational uses.

22670 (PB–90-138926/XAB) **Health assessment for Batavia Landfill, Genesee County, Batavia, New York, Region 2. CERCLIS No. NYD980507693. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). 30 Jun 1989. 12p. Available from NTIS, PC A03/MF A01.

The Batavia Landfill is a 30-acre site located in the Town of Batavia (Genesee County) New York. Drummed and undrummed wastes contributing to the contamination identified at the site include heavy-metal sludges, oils, and organic solvents. Analyses of ground water indicates the presence of heavy metal and volatile organic contaminants (VOCs). Surface-water analysis indicates the presence of heavy metal contaminants. Analyses of off-site ground

water samples taken from private wells, from a well serving a trailer park and from municipal wells serving the Town of Oakfield found iron in concentrations up to 3.2 mg/L and VOCs in concentrations up to 240 microg/L. The Batavia Landfill has created a public health and exposure concern for those who use the contaminated ground water in the vicinity of the landfill. The extent of off-site contaminant migration by the ground water must be determined and a complete site characterization, including a thorough sampling plan of all media is necessary to evaluate the potential environmental impact of the landfill.

22671 (PB–90-138934/XAB) **Health assessment for Byron Barrel, Genesee County, Byron, New York, Region 2. CERCLIS No. NYD980780670. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). 30 Jun 1989. 12p. Available from NTIS, PC A03/MF A01.

The Byron Barrel and Drum Site is listed on the National Priorities List. Byron Barrel and Drum site contains an abandoned gravel pit and was used as a salvage yard for heavy construction equipment such as graders, bulldozers, cement mixers, and cranes. In 1982 an unidentified individual reported that the site was also used for the disposal of approximately 400 (55-gallon) steel barrels filled with noxious-smelling chemicals. Prior to drum removal, several drums were sampled to characterize the chemical constituents of the wastes. The results of these tests demonstrated that the drums contained organic solvents and degreasing agents including toluene, benzene, xylenes, and methylene chloride. Contamination of on-site ground-water has been confirmed. The amount of soil contamination on site is unknown and should be fully characterized.

22672 (PB–90-138942/XAB) **Health assessment for Anchor Lith Kemko, Hicksville, New York, Region 2. CERCLIS No. NYD001485226. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). Jun 1989. 12p. Available from NTIS, PC A03/MF A01.

Anchor Lith Kemko (ALK) is on the National Priorities List. ALK is located in the Town of Hicksville, Nassau County, New York. 1,1,1-Trichloroethane, trichloroethene, tetrachloroethene and 1,1-dichloroethene are the groundwater contaminants of concern. Two subsurface soil samples collected during monitoring well installation revealed levels of methylene chloride at 490 and 41 micro g/kg and 1,1,1-trichloroethane at <20 and 22 micro g/kg, respectively. The site is considered to be of potential public health concern due to the human health risk caused by the possibility of exposure to hazardous substances via contaminated ground water.

22673 (PB–90-138967/XAB) **Health assessment for Claremont Poly Chemical Corp., Nassau County, Old Bethpage, New York, Region 2. CERCLIS No. NYD002044584. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). 30 Jun 1989. 12p. Available from NTIS, PC A03/MF A01.

The Claremont Polychemical Site consists of nine acres in Old Bethpage, Nassau County, New York. The facility produced materials used in coloring plastics. Claremont Polychemical operated from 1966 to 1980 and discharged organic solvents, resins, and washing wastes. Previous studies of the Claremont Polychemical Site have revealed contamination of the ground water and soil with tetrachloroethene, trichloroethene, 1,1,1-trichloroethane, 1,2-dichloroethenes, and di(2-ethylhexyl) phthalate. Organic contamination of ground water exceeds New York State and federal standards and guidelines. The predominant contaminant found in the shallow ground water aquifer has been tetrachloroethene. The Old Bethpage Landfill, located west of the site, is a confirmed source of contamination, including tetrachloroethene and other compounds which are also associated with Claremont Polychemical. The site is considered to be a potential health concern because of the risk to human health caused by the possibility of exposure to hazardous substances via contamination of public water supply wells in the area.

22674 (PB–90-138983/XAB) **Health assessment for Colesville Landfill, Broome County, Colesville, New York, Region 2. CERCLIS No. NYD980768691. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). 30 Jun 1989. 11p. Available from NTIS, PC A03/MF A01.

The Colesville Landfill is located in the Town of Colesville, Broome County, New York, and was owned and operated by the county between 1969 and 1984. The sloping 30 acre site received about 9,000 tons of municipal refuse per year. Industrial wastes (organic solvents, aqueous dye waste) were reportedly deposited between 1973 and 1975. Drainage from the landfill is by the North and South Streams which surround the landfill and lead to the Susquehanna River. Homeowner well-monitoring data confirmed the presence of volatile organic contaminants (VOCs) in ground water. Iron, copper, and manganese in private wells exceeded drinking-water standards; however, the levels were typical of area ground water. On-site surface soils are contaminated. The Colesville Landfill poses a potential human health hazard. Although the site is not fenced, its remote location reduces public use of the site, though game animals have free access. Signs should be posted in areas of active leachate seeps to notify the public of the contamination. Direct human exposure to contaminated ground water is minimal.

22675 (PB–90-139007/XAB) **Health assessment for the Endicott Wellfield Site, Broome County, New York, Region 2. CERCLIS No. NYD980780746. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 23 Feb 1988. 16p. Available from NTIS, PC A03/MF A01.

The Endicott Wellfield site is located near the southwestern boundary of the Village of Endicott in Broome County, New York. The nine contaminants of concern found at the wellfield site are chloroethane, vinyl chloride, trans-1,2 dichloroethene, 1,1-dichloroethane, trichloroethene, chlorobenzene, benzene, and tetrachloroethene. The levels of these compounds in the well are sufficiently high to pose a public health threat.

22676 (PB–90-139023/XAB) **Health assessment for Facet Enterprises, Inc., Chemung County, Elmira Heights, New York, Region 2. CERCLIS No. NYD073675514. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). 1 May 1989. 14p. Available from NTIS, PC A03/MF A01.

The Facet Enterprises, Inc. plant is located on a 31-acre site in the town of Elmira Heights, Chemung County, N.Y. Significant levels of volatile organic compounds (VOCs) were detected in on-site monitoring wells including trichloroethene (TCE), trans-1,2-dichloroethene, vinyl chloride, and 1,1,1-trichloroethane. TCE has been detected in the ground water approximately 1,500 feet southeast of the plant site. The Facet site presents a potential public health concern to on-site workers and the surrounding community, particularly with respect to the existing contamination of the public drinking water supply.

22677 (PB–90-139049/XAB) **Health assessment for Johnstown City Landfill, Fulton County, Johnstown, New York, Region 2. CERCLIS No. NYD980506927. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). 30 Jun 1989. 12p. Available from NTIS, PC A03/MF A01.

The Johnstown City Landfill is on the National Priorities List. It is a municipally operated unlined landfill. Significant amounts of industrial wastes containing chromium trimmings, other heavy metals, and solvents have been deposited in the landfill. The sewage sludge is known to contain high concentrations of chromium, iron, and lead. The Johnstown City Landfill represents a potential human health hazard. Ground-water contamination, which may affect private wells in the vicinity of this site is presently the greatest area of concern and must be clearly addressed in all future work.

22678 (PB–90-139072/XAB) **Health assessment for Kentucky Avenue Wellfield National Priorities List (NPL) site, Horseheads, Chemung County, New York, Region 2. CERCLIS No. NYD981560428. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 31 Jan 1989. 11p. Available from NTIS, PC A03/MF A01.

The Kentucky Avenue Wellfield is a National Priorities List site located near Horseheads, New York. The wellfield was developed in 1962 as part of the Elmira Water Board public water-supply system. The primary contaminants at the site are trichloroethene (TCE) and trans-1,2-dichloroethene. Although the source(s) of the contamination has not been located, several industrial facilities in the area are suspect. The potential environmental pathways at the

site are related to ground-water, sediment, and surface water. The potential pathways for human exposure include ingestion of contaminated ground-water by users of private wells, dermal absorption of contaminants found in contaminated ground-water, and inhalation of volatile organic compounds during domestic activities. ATSDR has concluded that the site poses a potential health concern because risk to humans exists from possible exposure to hazardous substances.

22679 (PB–90-139080/XAB) **Health assessment for Liberty Industrial Finishing, Nassau County, Farmingdale, New York, Region 2. CERCLIS No. NYD000337295. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). 30 Jun 1989. 12p. Available from NTIS, PC A03/MF A01.

The Liberty Industrial Finishing (LIF) Site, located in the Town of Farmingdale, Nassau County, New York is on the National Priorities List. LIF operated continuously from 1948 to 1978 with operations including electroplating, dying, and painting. LIF used two ground-water recharge basins as lagoons for discharging treated waste water. The data and historical site operations indicate that cadmium, chromium, and cyanide are the major inorganic contaminants. Based on the available information, the site is considered to be of potential public health concern.

22680 (PB–90-139106/XAB) **Health assessment for Ludlow Landfill National Priorities List (NPL) site, Clayville, Oneida County, New York, Region 2. CERCLIS No. NYD013468939. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 25 Aug 1988. 13p. Available from NTIS, PC A03/MF A01.

The Ludlow Landfill is a National Priorities List site located in Clayville, Oneida County, New York. The landfill was in operation for over 20 years and was closed February 15, 1988. At the time of its closure only municipal refuse was being accepted for disposal, but in the past, some industrial wastes were deposited in the landfill. The primary contaminants found at the site are polychlorinated biphenyls (PCBs) and volatile organic compounds. Off-site migration of contaminants can occur via ground water, surface water, and suspended sediments. Potential adverse effects on public health could occur if PCBs or other site-related chemicals migrated off-site in ground water and contaminated downgradient potable-well supplies. Human exposure to PCB-contaminated soils in the wetlands or the consumption of biota from the wetlands are also pathways of potential public health concern.

22681 (PB–90-139114/XAB) **Health assessment for Malta Rocket Test Site, Saratoga County, Malta, New York, Region 2. CERCLIS No. NYD980535124. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). 30 Jun 1989. 13p. Available from NTIS, PC A03/MF A01.

The Malta Rocket Fuel Test Station is listed by the USEPA on the National Priorities List. The General Electric Company tested operations at the site as a contractor to the U.S. Government. Beginning in December 1974, and continuing until December 1979, Exxon Nuclear Company, Inc. conducted operations at a building on the site. During the course of its operations, Exxon handled several hazardous chemicals including methylethyl ketone, acetone, tetrachloroethene, and toluene. Various site inspections, investigations and engineering studies have been conducted at the site. Ground water collected from monitoring wells on-site is contaminated with chloroform, carbon tetrachloride, and trichloroethene. In April 1985, sampling of ground water supplies serving the site demonstrated significant drinking-water contamination with concentrations of carbon tetrachloride up to 220 micro g/L, chloroform up to 25 micro g/L, PCBs up to 1.3 micro g/L, trichlorethene up to 120 micro g/L, and boron up to 140 micro g/L. The site has been the subject of several investigations, however, none have been comprehensive. The site should be the subject of a complete remedial investigation/feasibility study before a full health assessment can be prepared.

22682 (PB–90-139155/XAB) **Health assessment for Nepera Chemical Co., Orange County, Maybrook, New York, Region 2. CERCLIS No. NYD000511451. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). 30 Jun 1989. 11p. Available from NTIS, PC A03/MF A01.

The Nepera Chemical Company's Maybrook site is an inactive 23-acre site located southwest of Maybrook, New York. The site was used by Nepera from 1953 to 1968 for the disposal of industrial waste generated by Nepera's Harriman, New York, plant which produced pharmaceutical chemicals, hydrogels, and pyridine-based industrial-chemical intermediates. Test borings taken from the former lagoon sites indicate the presence of subsurface waste materials. In five lagoons the waste materials are stained with a dark oily substance the thickness of which varies, by lagoon, from one to eight feet. Laboratory analysis of the material found acetone, toluene, (total) xylenes, methyl ethyl ketone (MEK), aniline, pyridines (alpha-picoline, 2-alpha-picoline), cyanide, and metals. Most of the contaminants associated with Nepera Chemical have been found on-site at levels that exceed existing New York State and Federal Standards or Guidelines for ground, surface, and drinking water. The extent of the contaminated ground water plume off-site is not known and raises concerns about its possible impact on local drinking-water supplies, both residential and public. As part of the remedial investigation, further monitoring of off-site wells for the unique site-specific compounds will be undertaken.

22683 (PB–90-139163/XAB) **Health assessment for Niagara County Refuse Disposal, Niagara County, New York, Region 2. CERCLIS No. NYD000514257. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). Jun 1989. 11p. Available from NTIS, PC A03/MF A01.

The Niagara County Refuse Disposal Site, a National Priorities List Site, occupies approximately 50 acres in the Town of Wheatfield, Niagara County, New York. Surface drainage is conveyed from the site by ditches and enclosed drains that carry runoff south to the Niagara River or north to Black Creek. The site received industrial solid and chemical wastes, largely of unknown composition, from 1969 to 1976. The Niagara County Refuse Site has been investigated several times since 1973. Analytical results among the studies are conflicting and analytical quality control is poor. Heavy metals have been found in leachate discharging to the Niagara River. Sediment samples have high levels of bis(2-ethylhexyl)phthalate, polycyclic aromatic hydrocarbons, and low levels of PCBs. The site poses a potential health threat to people who use the Niagara River for fishing, recreation, and drinking water and to on-site workers during any remedial work.

22684 (PB–90-139171/XAB) **Health assessment for North Sea Landfill, Suffolk County, North Sea, New York, Region 2. CERCLIS No. NYD980762520. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). 30 Jun 1989. 11p. Available from NTIS, PC A03/MF A01.

The North Sea Landfill, located in Southhampton, Suffolk County, New York, is an active municipal landfill approximately 110 acres in size. A leachate plume including chlorinated solvents and heavy metals emanates from the landfill and is traveling in a northwesterly direction to a brackish inland cove (Fish Cove) approximately one-half mile distant. In the past, ground-water on-site was found to be contaminated with 17 micro g/1 (ppb) of vinyl chloride. Chlorinated organic chemicals including vinyl chloride have been detected both on- and off-site at lower concentrations. Toluene and lead have been detected in ground-water on and off-site at concentrations from 1 to 6 micro g/L and 27 to 740 micro g/L, respectively. The potential public health concerns of primary importance are exposure to hazardous materials on-site for employees and exposures through contaminated ground water for the off-site population.

22685 (PB–90-139197/XAB) **Health assessment for Olean Well Field National Priorities List (NPL) site, Olean Cattaraugus County, New York, Region 2. CERCLIS No. NYD980528657. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 21 Nov 1988. 15p. Available from NTIS, PC A03/MF A01.

The Olean Well Field National Priorities List site is located in the City and Town of Olean, Cattaraugus County, New York. Trichloroethylene contamination of three municipal water wells was discovered in January 1981. The City of Olean discontinued the use of the three wells and obtained potable water from an older surface-water treatment plant. Private potable water wells with levels of contamination higher than acceptable levels are being treated with activated carbon. The Record of Decision signed by the U.S.

Environmental Protection Agency on September 24, 1985 requires two primary actions: the treatment of ground water obtained from the three municipal wells for use as public water supply and the extension of the municipal-water-distribution system to 93 affected and potentially affected residents using private wells within the site. The site is of potential health concern because of the risk to human health resulting from possible exposure to hazardous substances at concentrations that may result in adverse health effects.

22686 (PB–90-139213/XAB) **Health assessment for Vega Alta Public Supply Wells Site, Vega Alta, Puerto Rico, Region 2. CERCLIS No. PRS187147. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 2 Dec 1988. 13p. Available from NTIS, PC A03/MF A01.

The Vega Alta Public Supply Wells Site is a public water supply wellfield located in the municipality of Vega Alta, Puerto Rico. Based on data collected from 1983 to 1985, the ground water is contaminated with volatile organic chemicals (VOCs), notably trichloroethylene, tetrachloroethylene, and 1,2-trans-dichloroethylene. A remediation alternative selected in a Record of Decision dated September 29, 1987 calls for treatment of 4 of the more highly contaminated wells and shutting down 2 others. Remediation efforts are to include air stripping and possibly treatment by carbon adsorption. Monitoring of the effectiveness of these efforts will determined their adequacy to bring the quality of the tap water to acceptable levels. It is not known whether the water currently supplied through the municipality has elevated concentrations of VOCs. Therefore, based on the limited information available, ATSDR has concluded that the Vega Alta Wells site is of public health concern.

22687 (PB–90-139957/XAB) **Health assessment for RCA del Caribe, Inc., Barceloneta, Puerto Rico, Region 2. CERCLIS No. PRD090370537. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 19 Jan 1989. 7p. Available from NTIS, PC A02/MF A01.

The RCA del Caribe site is listed on the National Priorities List. The 20-acre site is the former location of RCA's television screen etching mask production facility. Wastes generated were disposed of in four holding lagoons. The environmental contamination on-site consists of chromium (160 ppm), beryllium (6 ppm), selenium (9 ppm), and iron (23,100 ppm) in lagoon sediments. Based on the available information, the site is considered to be of potential public health concern because of the risk to human health caused by the possibility of exposure to hazardous substances via ground water.

22688 (PB–90-140005/XAB) **Health assessment for Barceloneta Landfill, Florida Afuetra, Puerto Rico, Region 2. CERCLIS No. PRD98059129. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 1990. 7p. Available from NTIS, PC A02/MF A01.

The Barceloneta Landfill Site (BLS) is located in Florida Afuera, Puerto Rico. BLS is an active municipal/industrial site. Approximately 300 tons of hazardous wastes have been disposed in sink holes, which are approximately 100 feet deep. Preliminary on-site sampling results have identified various volatile organic compounds. They include: chloroform (2 ppm in sludge), toluene (31 ppb in surface water), phenols (3 ppm in sludge), and methylene chloride (52 ppb in sludge). Other contaminants identified on-site in water runoff and sludge include aluminum, cobalt, iron, manganese, zinc, mercury, and lead. The site is considered to be of public health concern because of the risk to human health caused by the likelihood of human exposure to hazardous substances. Direct contact and ingestion of ground water, surface water, soil, and sediment are the most likely exposure routes. Inhalation of volatilized contaminants or contaminants entrained in air by area residents is another exposure route that may pose a public health concern. Ingestion of fish that bioaccumulate site contaminants may pose a potential for public health concern because it was reported that fish is a food staple for the area.

22689 (PB–90-140013/XAB) **Health assessment for York Oil Company, Moira, New York, Region 2. CERCLIS No. NYD000511733. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 8 Jul 1988. 14p. Available from NTIS, PC A03/MF A01.

York Oil Company site is approximately 17 acres located in the Town of Moira, northwestern Franklin County, in upper New York State. York Oil Company was a waste-oil recycling facility which operated for approximately 18 years, collecting and refining oils from the New England area. Off-site migration of contaminants has occurred via groundwater and overland flow. There are thirteen residential wells within one-half mile of the site. Currently, the residential wells are not contaminated by compounds from the site; however, the contamination appears to be migrating toward three residential wells downgradient of the site. The site poses a public health concern as a result of the potential for indirect ingestion and direct contact exposures to: Polychlorinated biphenyl (PCB)- and lead-contaminated wastes on-site, PCB-contaminated soil on-site, and PCB-contaminated sediments off-site. The potential health threats posed by inhalation exposures to vapors, fumes, and dusts from the site and ingestion of contaminated food-chain entities could not be evaluated.

22690 (PB–90-140039/XAB) **Health assessment for Warwick Landfill, Orange County, Warwick, New York, Region 2. CERCLIS No. NYD980506679. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). 30 Jun 1989. 11p. Available from NTIS, PC A03/MF A01.

Warwick Landfill is located in the southeastern portion of Orange County in the Town of Warwick, New York. The 13-acre municipal landfill was operated as a refuse-disposal facility from the late 1950s until 1979 when the New York State Department of Environmental Conservation issued a restraining order. Industrial waste was allegedly disposed at the site. Environmental contamination has been confirmed in on-site ground-water monitoring wells and leachate seeps. Historically, sampling has included: surface water (Long Pond Inn), leachate/surface water, ground-water on-site, private wells off-site (5 homes), and sediment and soils on-site. Contamination of surface water by organics and inorganics has been identified in seeps off-site. Ground-water contamination has been identified on-site in all four of the shallow monitoring wells. The site represents a potential public health threat. Monitoring of private wells should continue to ensure domestic water sources for the area residents.

22691 (PB–90-140047/XAB) **Health assessment for Volney Landfill, Volney, New York, Region 2. CERCLIS No. NYD980509376. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 16 Jul 1987. 12p. Available from NTIS, PC A03/MF A01.

The Volney Landfill National Priority List site was evaluated for the potential health threat to area residents from contamination of ground water, surface water, and soil. Levels of arsenic, cyanide, benzene, and other Hazardous Substance List contaminants may pose a public health threat to area residents. The widespread use of ground water by local residents implicates this contaminated medium as the most likely source for human exposure to contaminants. Surface-water and sediment contamination should not pose a health risk, although further examination of bioaccumulation in aquatic food species is recommended to properly assess these issues. A Feasibility Study summarizing remedial cleanup alternatives for the Volney Landfill Site was also addressed. Examination of the eight proposed alternatives reveal that none include provisions for an alternative water source for area residents and, therefore, fail to adequately address all public health concerns. All alternatives failed to address contamination of bedrock and stream sediments.

22692 (PB–90-140070/XAB) **Health assessment for Tronic Plating Co. Inc., Suffolk County, Farmingdale, New York, Region 2. CERCLIS No. NYD002059517. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). 30 Jun 1989. 10p. Available from NTIS, PC A02/MF A01.

Tronic Plating, an electroplating facility in operation from 1968 to 1984 was located in Farmingdale, Township of Babylon, Suffolk County, New York. During its operation the facility discharged industrial wastes into a sanitary pit and four below-ground leaching pools. Storm drains located approximately 33-40 feet from the northern rear door of the operation were also allegedly utilized for the disposal of potentially hazardous effluent. These activities are believed to have resulted in contamination of ground water with

heavy metals. At present the contamination of soil and ground water with heavy metals or other compounds associated with the facility can only be assumed since these media on and around the site have yet to be tested. The Tronic Plating site represents a potential human health threat. The Remedial Investigation will fully evaluate both inorganic and organic contamination at the site, including extensive sampling for those compounds on EPA's Target Compound List for water and soil. Until such results are available, the extent of environmental contamination due to on-site subsurface discharge of hazardous effluents cannot be determined.

22693 (PB–90-140088/XAB) **Health assessment for Syosset Landfill, Nassau County, Syosset, New York, Region 2. CERCLIS No. NYD000511360. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). 30 Jun 1989. 14p. Available from NTIS, PC A03/MF A01.

The Syosset Landfill, located in the Town of Oyster Bay, Nassau County, New York is approximately forty-four acres in size. From 1936 to 1974 the landfill received mixed municipal refuse, cesspool pump-out wastes, and industrial wastes. Ground water on-site is contaminated with organic and inorganic compounds including elevated levels of heavy metals (lead, arsenic, chromium and cadmium) reflective of industrial-waste disposal. A public water-supply well near the landfill was closed in 1974 due to problems allegedly resulting from the leachate plume emanating from the landfill. Due to the high permeability of soils contaminant migration through ground water can be rapid. Gas vents at the landfill side of the border contained low levels of vinyl chloride, trans-1,2-dichloroethene, 1,1,1-trichloroethane, trichloroethene and tetrachloroethene. Higher levels of benzene, toluene, ethylbenzene and xylenes were also detected. A review of data indicates the most-probable pathways of exposure to contaminants originating at the landfill would be from inhalation of migrating gas and use of contaminated ground water.

22694 (PB–90-140096/XAB) **Health assessment for Suffern Well Field NPL (National Priorities List) site, Village of Suffern, Rockland County, New York, Region 2. CERCLIS No. NYD980780878. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 4 May 1988. 13p. Available from NTIS, PC A03/MF A01.

The Suffern Well Field is a National Priorities List site located in the northwestern portion of the village of Suffern, Rockland County, New York. The contaminants found at the site consist of 1,1,1-trichloroethane (TCEA) in the ground-water and coal-gasification wastes which have been found in the ground-water and in the subsurface soil. Because of the potential for future contamination, periodic monitoring of the wells for a reasonable time to ensure that no contamination occurs is needed to ensure protection of human health.

22695 (PB–90-140104/XAB) **Health assessment for Solvent Savers, Chenango County, Linckiaen, New York, Region 2. CERCLIS No. NYD980421176. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). 30 Jun 1989. 11p. Available from NTIS, PC A03/MF A01.

The Solvent Savers site, a National Priorities List site, is located on a rural tract of land, in Lincklaen, Chenango County, New York. Organic chemicals found in groundwater include 1,1,1-trichloroethane, trichloroethylene, benzene, toluene, chloroform, phenol, trans-1,2-dichloroethene, and vinyl chloride. Analysis of one on-site soil sample showed the presence of PCBs. Inorganic chemicals (metals) identified in soil samples include cyanide, lead, arsenic and cadmium. The site poses a potential public health threat to residents on private water supplies adjacent to the site, to persons using Mud Creek (i.e., fishing, swimming), and to on-site workers during any remedial work.

22696 (PB–90-140112/XAB) **Health assessment for SMS Instruments, Inc., Deer Park, New York, Region 2. CERCLIS No. NYD001533165. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). Jun 1989. 12p. Available from NTIS, PC A03/MF A01.

SMS Instruments is located in a light industrial area in Deer Park, Suffolk County, New York. The company's main business is overhauling military aircraft components. Historically, degreasing and paint-stripping agents as well as fluorescent-oil dyes were used. Waste streams include naphtha and petroleum distillates, heavy metals, and a variety of halogenated and non-halogenated solvents. In 1979-1980, testing performed by Suffolk County Department of Health indicated heavy-metal contamination (iron, 61 mg/L; chromium, 29 mg/L; zinc, 56 mg/L; lead, 45 mg/L; and cadmium, 25 mg/L) in on-site leaching pools. Ground-water monitoring wells have indicate high levels of solvents: xylene, 12,000 micro g/L; toluene, 8,300 micro g/L; benzene, 350 micro g/L; 1,1,1-trichloroethane, 2,300 micro g/L; 1,1,2-trichloroethene, 2,200 micro g/L; and dichloromethane, 130 micro g/L. The site has potential public health impacts.

22697 (PB–90-140120/XAB) **Health assessment for Sinclair Refinery, Allegany County, Wellsville, New York, Region 2. CERCLIS No. NYD980535125. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). 30 Jun 1989. 12p. Available from NTIS, PC A03/MF A01.

The Sinclair Refinery Site in Allegany County, Wellsville, New York consists of a 90-acre former refinery site and an associated 11.5-acre landfill. Ground water and surface water and soils were found to contain elevated concentrations of organic and inorganic chemicals. A total of 152 compounds have been detected at the site at various times, with most of the organic compounds being petroleum-based. Detected inorganic compounds include arsenic, chromium and lead. The organic chemicals of concern are generally above expected environmental levels, particularly for subsurface soil samples. Minor contamination was observed in ground water monitoring wells. The sampling described in the Feasibility Study must be completed to characterize fully the current environmental contamination on-site and off-site. The data are required to assess fully the potential health impacts and to design final remedial activities.

22698 (PB–90-140138/XAB) **Health assessment for Sarney Property, Amenia, New York, Region 2. CERCLIS No. NYD980535165. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). Jun 1989. 13p. Available from NTIS, PC A03/MF A01.

The Sarney Property is on the National Priorities List. Ground water beneath the site is contaminated with toluene, 1,2-dichloroethene, methyl ethyl ketone, vinyl chloride, trans-1,2-dichloroethene, chlorobenzene, and trichloroethene. Since potential exposures from these wells could occur in the future, periodic monitoring is recommended until permanent remediation has been completed.

22699 (PB–90-140146/XAB) **Health assessment for Rowe Industries, Suffolk County, Sag Harbor, New York, Region 2. CERCLIS No. NYD981486954. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). 30 Jun 1989. 10p. Available from NTIS, PC A02/MF A01.

Rowe Industries is on the National Priorities List. The site was used for the manufacture of small motors for appliances, such as tools and hairdryers. Tetrachloroethene, trichloroethene and 1,1,1-trichloroethane are the contaminants of greatest concern at the site. Human exposures associated with the use of ground water from residential wells has been eliminated by the installation of the public water supply. The site poses a limited public health threat to adjacent residences through exposure to contaminants by incidental contact with ground water and soil gas.

22700 (PB–90-140153/XAB) **Health assessment for Robintech Site, Broome County, Vestal, New York, Region 2. CERCLIS No. NYD002232957. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). 30 Jun 1989. 12p. Available from NTIS, PC A03/MF A01.

The Robintech, Inc. Site, located in the Town of Vestal, Broome County, New York is on the National Priorities List. The company presently manufactures PVC (polyvinyl chloride) pipe from PVC resin and assembles plastic-coated cable at the facility. Groundwater data from production wells on-site showed the presence of numerous volatile organic compounds and metals. Surface soil, surface water, and sediment samples taken both on-site and off-site have shown volatile organics and inorganics (metals) present at elevated levels. The site poses a potential public health threat to

users of the Vestal municipal wells, and users of the adjacent recreational facility. The site is also a public health threat to employees and on-site workers during the investigations and remedial work.

22701 (PB–90-140161/XAB) **Health assessment for richardson Hill Landfill, Delaware County, Sidney, New York, Region 2. CERCLIS No. NYD980507735. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). 30 Jun 1989. 14p. Available from NTIS, PC A03/MF A01.

The Richardson Hill Road Landfill has been accepted as an NPL site. A private hauler disposed of waste oil containing solvents and PCBs from the Bendix plant located in the Town of Sidney in this pit. The drainage for the area flows south and empties into the Cannonsville Reservoir six miles downstream. The reservoir supplies drinking water for New York City. However, the contaminant concentration drops dramatically with distance from the site. There are 13 compounds that exceed existing NYS and federal drinking water and environmental standards and guidelines. However, the full extent of the contamination has not yet been defined. The site represents a potential threat to the public health, although present human exposure appears minimal.

22702 (PB–90-140179/XAB) **Health assessment for Ramapo Town Landfill, Rockland County, Ramapo, New York, Region 2. CERCLIS No. NYD000511493. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). 30 Jun 1989. 11p. Available from NTIS, PC A03/MF A01.

The Town of Ramapo Sanitary Landfill, a USEPA National Priorities List Site, is located in the Torne Brook Valley, a one-quarter mile northeast of the Ramapo River and one mile northeast of the Village of Hillburn. Since opening in 1971, the site has received primarily municipal refuse although industrial sludge disposal occurs, and the site has been linked with illegal hazardous-waste haulers. Sampling conducted to date has been limited to ground water and surface water. Analysis reveals contamination of both media with heavy metals, phenols and volatile organic compounds. Additionally, surface water discharges were found to contain PAHs, phthalates and oil/grease. Chemical contamination from the site presents a potential threat to public health. Regular monitoring of public drinking water wells has begun; monitoring of private wells should also occur on a regular basis.

22703 (PB–90-140435/XAB) **Health assessment for Port Washington Landfill, North Hempstead, New York, Region 2. CERCLIS No. NYD980654206. Preliminary report.** New York State Dept. of Health, Albany, NY (USA). Jun 1989. 14p. Available from NTIS, PC A03/MF A01.

The Port Washington Landfill is located in the northwestern portion of Nassau County, New York. Prior to the Town of North Hempstead's purchase of the property in 1973, the site was used from the late 1880s as a sand and gravel mine and as a construction and demolition debris landfill. Operation of the landfill during the 1970s resulted in the generation of an off-site soil gas plume composed of methane and volatile organic compounds. Of the volatile compounds, vinyl chloride is of special concern because of its presence in the on-site soil gas at high concentrations and its carcinogenicity. A variety of volatile organic compounds have been detected in the ground water, leachate, and ambient and subsurface air. All of the contaminants found in ground water exceed New York State drinking water standards. Elevated brain cancer incidence was found in males in the study area and was limited in time from 1978 to 1987. Whether or not the cases are related to the airborne contaminants is unknown. The cause and effect relationship should be investigated by examining brain-cancer incidence near landfills with similar vapor-emission problems.

22704 (PB–90-855859/XAB) **Water treatment by reverse osmosis. November 1970-October 1989 (Citations from the US Patent data base). Report for November 1970-October 1989.** National Technical Information Service, Springfield, VA (USA). Jan 1990. 60p. Available from NTISPC N01/MF N01.

This bibliography contains citations of selected patents concerning water purification systems and components using reverse-osmosis technology. Patents include systems and devices for sea water, waste water, and drinking water purification. Topics include complete purification systems, valves and distribution components, membranes, supports, storage units, and monitors. Water purification systems using activated charcoal are referenced in a related published bibliography. (Contains 103 citations fully indexed and including a title list.)

22705 (PB–90-856733/XAB) **Activated charcoal filters: Water treatment, pollution control, and industrial applications. October 1970-October 1989 (Citations from the US Patent data base). Report for October 1970-October 1989.** National Technical Information Service, Springfield, VA (USA). Jan 1990. 80p. Available from NTISPC N01/MF N01.

Supersedes PB–89-869150.

This bibliography contains citations of selected patents concerning activated charcoal filters and their applications in water treatment, pollution control, and industrial processes. Filtering methods and equipment for air and water purification, industrial distillation and extraction, industrial leaching, and filtration of toxic materials and contaminants are described. Applications include drinking water purification, filtering beverages, production of polymer materials, solvent and metal recovery, waste conversion, automotive fuel and exhaust systems, swimming-pool filtration, tobacco-smoke filters, kitchen ventilators, medical filtration treatment, and odor-absorbing materials. (This updated bibliography contains 173 citations, 12 of which are new entries to the previous edition.)

22706 (PNL–7257) **Environmental monitoring master sampling schedule, January–December 1990.** Bisping, L.E. Pacific Northwest Lab., Richland, WA (USA). Jan 1990. 52p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract AC06-76RL01830. Order Number DE90007615. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

Environmental monitoring of the Hanford Site is conducted by the Pacific Northwest Laboratory (PNL) for the US Department of Energy (DOE). This document contains the planned schedule for routine sample collection for calendar year 1990 for the Environment Surveillance and Ground-Water Monitoring Projects. This schedule is subject to modification during the year in response to changes in Site operations, program requirements, and the nature of the observed results. Operational limitations such as weather, mechanical failures, sample availability, etc., may also require schedule modifications. Changes will be documented in the respective project files, but this plan will not be reissued. The purpose of these monitoring projects is to evaluate levels of radioactive and nonradioactive pollutants in the Hanford environs. This schedule includes ground-water sampling performed by PNL for environmental surveillance of the Hanford Site.

22707 (STUK-A–83) **Radioactivity of Focus vesiculosus along the Finnish coast in 1987: Supplement 9 to annual report 1987 (STUK-A-74).** Ilus, E.; Klemola, S.; Sjoeblom, K.-L.; Ikaeheimonen, T.K. Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland). May 1988. 36p. Order Number DE90619476. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Samples of Fucus vesiculosus were collected along the west and south coast of Finland at 25 stations in June-October 1987. More detailed surveys were conducted in the marine areas surrounding the nuclear power stations at Olkiluoto and Loviisa. The samples were analysed for gamma-emitting radionuclides and partly also for ^{90}Sr and transuranic elements. From the twelve gamma-emitting radionuclides detected in the Focus samples, ^{40}K, ^{106}Ru, ^{110m}Ag, ^{134}Cs and ^{137}Cs were found in nearly all samples. ^{54}Mn and ^{65}Zn were almost regularly detected in the samples from the Olkiluoto and Loviisa areas and commonly also along the whole coast, whereas ^{60}Co was rarely found at the coastal stations outside the immediate vicinities of the power stations. The activity concentrations of ^{137}Cs varied in the Fucus samples from 80 to 670 Bq kg^{-1} dry weight. The highest values were found in the Loviisa area and in the eastern part of the Gulf of Finland and the lowest in the Archipelago Sea. The values reflect differences in the amounts of local fallout and runoff, but also the transport of radionuclides by river waters and currents in the sea. The results provide evidence of the indicator value of Fucus vesiculosus in the monitoring of radioactive substances, both in the environs of the nuclear power

stations and also in studies regarding the dispersion and behaviour of fallout nuclides in the marine environment. Among the great number of samples taken in the Finnish monitoring programme, Fucus was the most sensitive bioindicator of ^{60}Co and ^{65}Zn, and thus enabled detection of these radionuclides in the fallout from Chernobyl.

22708 **The geochemistry of fallout plutonium in the North Atlantic: II. $^{240}Pu/^{239}Pu$ ratios and their significance.** Buesseler, K.O. (Woods Hole Oceanographic Institution, MA (USA)); Sholkovitz, E.R. *Geochimica et Cosmochimica Acta (USA),* 51(10): 2623-2637 (Oct 1987). DOE Contract FG02-85ER60358.

A systematic decrease in the $^{240}Pu/^{239}Pu$ ratios in marine sediments is found with increasing water depth along a transect of cores between Woods Hole and Bermuda. The $^{240}Pu/^{239}Pu$ atom ratios range from similarly ordered 0.18 on the shelf to similarly ordered 0.10 at 5000 m but do not change with depth in individual cores. A model is presented which can account for the range of $^{240}Pu/^{239}Pu$ ratios found in this and other similar studies. The authors propose that there have been at least two distinct sources of fallout Pu to this region. The major source of Pu is global stratospheric fallout, characterized by a $^{240}Pu/^{239}Pu$ ratio of 0.18 and a relatively long residence time in seawater. The second source is characterized by a much lower $^{240}Pu/^{239}Pu$ ratio, and relative to global fallout it must have been much more efficiently removed from the water column to deep-sea sediments. They suggest that surface-based low yield testing at the Nevada Test Site is the only source of low ratio fallout Pu which could account for the timing, inventories, and refractory characteristics of this second component of fallout Pu inputs to the North Atlantic.

22709 **The geochemistry of fallout plutonium in the North Atlantic: I. A pore water study in shelf, slope and deep-sea sediments.** Buesseler, K.O. (Woods Hole Oceanographic Institution, MA (USA)); Sholkovitz, E.R. *Geochimica et Cosmochimica Acta (USA),* 51(10): 2605-2622 (Oct 1987). DOE Contract FG02-85ER60358.

The distribution of fallout plutonium between pore waters and sediments in the Northwest Atlantic is examined in order better to define the potential for Pu migration from and within marine sediments. Along a transect of seven cores collected between Woods Hole and Bermuda, the solid phase $^{239,240}Pu$, $^{210}Pb^{ex}$ and ^{137}Cs results do not suggest that any of these tracers are preferentially mobile within the cores. Pore water Pu activities appear to be controlled primarily by the distribution of Pu in the solid phase, with an operationally determined distribution coefficient, K_d, in the range of 0.2-23 x 10^6. There is a trend in the K_ds along the transect, with higher values in the 10^4-10^5 range on the shelf and slope, to lower values < 10^4 in the deep-sea cores. The exact mechanism for this shift has yet to be determined. While the Pu pore water activity at the sediment-water interface is elevated over near bottom water activities, the potential for Pu remobilization out of the sediments is small. Sediment mixing models are not significantly altered by the inclusion of Pu diffusion terms since the pore water terms are so small relative to typical sediment mixing rates.

22710 (DOE/ER/13053–5) **Energetics of end product excretion in anaerobic bacteria and the metabolism of fatty acids by Syntrophomonas wolfei: Progress report, December 16, 1985–November 15, 1986.** McInerney, M.J. Oklahoma Univ., Norman, OK (USA). [1986]. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract AS05-83ER13053. Order Number DE90007661. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The study of anaerobic hydrogen-producing syntrophic bacteria is important for several reasons. These bacteria degrade fatty acids which are important intermediates in anaerobic degradation and methanogenesis. The rate and extent of anaerobic degradation of complex polymeric materials often depends on the activity of these organisms. The production of H_2 during anaerobic fatty acid degradation is energetically favorable only when H_2 is maintained at a low level by another bacterium such as a H_2- using methanogen. Thus, the fatty acid-degrading syntrophic associations serve as excellent models to study the biochemical aspects of mutualism. The fatty acid-degrading syntrophic bacteria are very slow growers since little free energy is released during fatty acid degradation. These bacteria must have very efficient energy conservation systems which are not understood at this time. Further study of these organisms will provide useful information on bioenergetics of living systems. We have chosen to study the metabolism and energetics of the anaerobic, syntrophic, fatty acid degrader, Syntrophomonas wolfei. This organism is the best characterized syntrophic bacterium and serves as an appropriate model organism.

22711 (DOE/ER/13086–T1) **[Molecular mechanism of energy transduction by plant membrane proteins]: Progress report, June 15, 1983–June 15, 1984.** Wisconsin Univ., Madison, WI (USA). 1984. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-83ER13086. Order Number DE90008433. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In anticipation of future needs, one of the first projects I initiated was the production of antibody against the ATPase. I chose to produce antibody against the *Neurospora* enzyme mainly because it was readily available in large amounts, and I wished to become familiar myself with the methodology of producing and using antibodies. In addition, there was a hope that there would be sufficient cross-reactivity with the higher plant enzyme, to allow its use with the higher plant project as well. The postdoctoral associate I hired has had extensive experience with both polyclonal and monoclonal antibodies, and has done an excellent job of getting this project off the ground. We decided to produce polyclonal antibody rather than monoclonal antibodies because we have already committed substantial time and money in a HPLC and protein sequenator we didn't want to waste the additional time (6-12 months), equipment and space that it would take to establish a working monoclonal facility, and polyclonal antibody is frequently more sensitive and yields a better immunoprecipitation.

22712 (DOE/ER/13368–6) **Enzymology of acetone-butanol-isopropanol formation: Progress report, February 1, 1989–January 31, 1990.** Chen, Jiann-Shin. Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (USA). Jan 1990. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-85ER13368. Order Number DE90007660. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The objectives of the project are to elucidate first the molecular properties of solvent-forming enzymes and then to apply the information gained from the enzymological study to elucidate the control mechanisms for the solvent-producing pathways and the expression of solvent-production genes. Our research primarily involves two strains of Clostridium beijerinckii (Clostridium butylicum): C. beijerinckii NRRL B593 which produces isopropanol in addition to acetone, n-butanol, and ethanol, and C. beijerinckii NRRL B592 which produces acetone, n-butanol and ethanol, but not isopropanol. More recently, we started to include another solvent-producing organism, Bacillus macerans, in our study. B. macerans produces a high level of acetone and ethanol under anaerobic conditions. Because B. macerans does not produce butyric acid and butanol, it has a less complex metabolic pathway than that of C. acetobutylicum and C. beijerinckii. This simpler metabolic pathway serves as a useful system for comparison in our study of the enzymology and regulation of solvent formation.

22713 (DOE/ER/13496–4) **[The structure of pectins from cotton suspension culture cell walls]: Progress report.** Mort, A. Oklahoma State Univ., Stillwater, OK (USA). Dept. of Biochemistry.

[1990]. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-86ER13496. Order Number DE90007667. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We have made progress on several projects to do with determining the structure of pectins. These include: (1) Devising a new sensitive method to determine the degree of methyl esterification (DOM) of pectins; (2) solubilization of all of RGI from cotton cell walls; (3) solubilization of RGII from cotton cell walls; (4) characterization of xyloglucan from cotton cell walls; and (5) investigation giving an indication of a cross-link between extension and pectin.

22714 (DOE/ER/13574–5) **Ethanologenic enzymes of Zymomonas mobilis: Progress report.** Ingram, L.O. Florida Univ., Gainesville, FL (USA). Dept. of Microbiology and Cell Science. 13 Feb 1990. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-86ER13574. Order Number DE90007663. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

In this study, we have proposed to investigate the mechanisms which permit the high level expression of the ethanologenic enzymes from Zymomonas mobilis (PDC, ADHI, ADHII). This research is continuing essentially as proposed in the original grant except that the scope has been expanded to include additional glycolytic enzymes from the lower portion of the Entner-Doudoroff pathway which are also highly expressed. Several enzymes which are expressed only at moderate levels are being examined for comparison (tryptophan biosynthesis, acid phosphatase).

22715 (DOE/ER/60649–T2) **[Development of gamma-emitting, receptor-binding radiotracers for imaging the brain and pancreas]: Progress report.** Reba, R.C. George Washington Univ., Washington, DC (USA). [1989]. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-88ER60649. Order Number DE90008314. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Our objectives were to (1) synthesize analogues of 4-IQNB which exhibit lower lipophilicity, preferably similar to that of QNB; (2) prepare F-18 analogues of QNB and (3) prepare analogues of 3-quinuclidinyl benzilate containing a lipophilic chelate Tc-99m. 11 refs., 1 tab.

22716 (LBL–28225) **Structures of peptide families by nuclear magnetic resonance spectroscopy and distance geometry.** Pease, J.H. Lawrence Berkeley Lab., CA (USA). Dec 1989. 176p. Sponsored by U.S. DOE Energy Research; National Science Foundation. DOE Contract AC03-76SF00098. Grant DMB 88-15998;DMB 86-09035. Order Number DE90007760. Available from NTIS, PC A09/MF A01 - OSTI; GPO Dep.

The three dimensional structures of several small peptides were determined using a combination of ^{1}H nuclear magnetic resonance (NMR) and distance geometry calculations. These techniques were found to be particularly helpful for analyzing structural differences between related peptides since all of the peptides' ^{1}H NMR spectra are very similar. The structures of peptides from two separate classes are presented. Peptides in the first class are related to apamin, an 18 amino acid peptide toxin from honey bee venom. The ^{1}H NMR assignments and secondary structure determination of apamin were done previously. Quantitative NMR measurements and distance geometry calculations were done to calculate apamin's three dimensional structure. Peptides in the second class are 48 amino acid toxins from the sea anemone Radianthus paumotensis. The ^{1}H NMR assignments of toxin II were done previously. The ^{1}H NMR assignments of toxin III and the distance geometry calculations for both peptides are presented.

22717 (PB–90-131889/XAB) **NIOSH (National Institute for Occupational Safety and Health) testimony on OSHA (Occupational Safety and Health Administration) guidelines on biotechnology to DOL (Department of Labor), by J. Donald Millar, August 1985.** National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Aug 1985. 6p. Available from NTIS, PC A02/MF A01.

The testimony reviewed the position of the National Institute for Occupational Safety and Health (NIOSH) concerning Occupational Safety and Health Administration (OSHA) proposed guidelines on biotechnology. In the guidelines OSHA stated that there was no evidence to warrant the issuance of new regulations specifically covering biohazards as workers would be adequately protected under already existing standards. NIOSH voices the feeling that it is not reasonable to expect that workers will be covered by provisions of a rule that has not been promulgated. It is also hard to predict how proposed changes in 29 CFR 1910.134 would affect the protection afforded to these workers. The second item concerns the use of Section 5(a) of the Occupational Safety and Health Act which states that each employer will provide a place of work free from recognized hazards, whereas many hazards present may not be recognized as such. Because research needs to indicate vast gaps in knowledge, NIOSH recommends that OSHA include, as part of their guidelines, requirements for increased industrial hygiene surveillance and medical monitoring.

22718 (PB–90-855669/XAB) **Transgenic plants and animals: Altered organisms from recombinant DNA technology. July 1982-July 1989 (Citations from the Life Sciences Collection data base). Report for July 1982-July 1989.** National Technical Information Service, Springfield, VA (USA). Jan 1990. 157p. Available from NTISPC N01/MF N01.

This bibliography contains citations concerning the development and use of transgenic plants and animals. Topics include methods of induction of new genes and transgenetic expression in the organism, development of animal models of human diseases, and design of insect tolerant plants. Examples of transgenic organisms include mice, fish, chicken, pigs, rye, maize, tobacco, tomatoes, lettuce, and cotton. This information is of value for the increased production of food from animals by producing animal carcasses with reduced fat content. The information is also valuable for production of herbicide tolerant, virus resistant, and insect resistant crop plants, as well as the rapid production of transgenic plants with flowers and seeds. (Contains 383 citations fully indexed and including a title list.)

22719 (UCRL–102862) **Does DNA cytometry have a place in the clinical laboratory?.** Mayall, B. (Lawrence Livermore National Lab., CA (USA)); Waldman, F.; Chew, K.; Christov, K.; Goodson, W.; Ljung, B.M.; Smith, H.S. Lawrence Livermore National Lab., CA (USA). 24 Jan 1990. 4p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. We are investigating the potential utility of cellular markers, including cellular proliferation and DNA cytometry, as independent diagnostic and prognostic markers in human breast cancer. However, as the clinical laboratory is responsible for providing physicians with data relevant to the patient, it is essential first to establish the validity of such markers before their use is recommended. Prospective validation is time-consuming and costly for tests of human malignancies, such as breast cancer, which may follow a lengthy and indolent course requiring patients to be followed for a decade or more before their clinical outcome is known. Therefore, retrospective studies on archival material are used whenever possible. Cell proliferation is recognized as an important diagnostic and prognostic marker for human breast cancer and a tritiated thymidine DNA labeling index greater than 5% is associated with a markedly less favorable outcome. Incorporation of bromodeoxyuridine (BrdUrd) into the DNA of S phase cells gives a similar labeling index. Unfortunately, paraffin-embedded archival material is rarely pre-labeled, and so DNA cytometry of either whole nuclei disaggregated from thick sections or partial nuclei in thin sections must be used as an indirect approach to estimate cellular proliferative activity. We are particularly interested in validating the DNA cytometry of thin sections and in relating the DNA histogram to in vivo BrdUrd labeling index, which is our standard for cellular proliferation. 6 refs., 1 fig.

22720 **Method of synthesizing double-stranded DNA molecules.** Jones, D. To National Institutes of Health, Bethesda, MD. USA Patent Application 7-432,993. 8 Nov 1989. 58p. Available from NTISPC N03/MF A01.

This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

This invention relates to a method in which the polymerase chain reaction (PCR) is used to generate products that when combined, denatured, and reannealed, form double-stranded DNA with discrete, cohesive, single-stranded ends. Such cohesive ends can be utilized in the formation of precise, directional DNA joints without dependence on enzyme-restriction sites. Furthermore, the placement of cohesive single strands on both ends of a DNA molecule permits a DNA strand or strands to be annealed to form circular DNA. These recombinant circles of DNA can be directly transfected into appropriate host cells. The method of generating recombinant circles upon reannealing PCR generated products simplifies DNA mutagenesis, recombination, and cloning.

22721 (PNL–6100-Pt.4, pp. 43) **Re-entry of starved plateau-phase Chinese hamster ovary cells into the replicative cycle.** Nelson, J.M.; Braby, L.A.; Metting, N.F.; Roesch, W.C. Pacific Northwest Lab., Richland, WA (USA). Feb 1987. In *Pacific Northwest Laboratory: Annual report for 1986 to the DOE Office of Energy Research: Part 4, Physical sciences.* Order Number DE87010025. Available from NTIS, PC A04/MF A01.

Kinetic differences between fed and starved Chinese hamster ovary (CHO) cells have been demonstrated. These differences have been further characterized by subculturing 14-day-old plateau-phase cells and following them as they progressed through their first post-plateau-phase cycles. Deoxyribonucleic acid distributions were determined by flow-cytometric analysis of fixed trypsinized cells, stained by the acriflavine-Feulgen procedure. About 83% of the starved populations are found in G(1) phase. These cells re-enter the replicative cycle almost immediately, passing into S phase within 11 hours, and into G(2) phase within 18 hours. The remaining 17% initially comprise about 2/3 (≈ 10%) S-phase and 1/3 (≈ 7%) G(2)-phase cells. Both of these subpopulations progress rapidly through mitosis, apparently producing large numbers of DNA-deficient daughter cells as they do so. In contrast, fed cultures consist of a mixture of cycling and noncycling cells. The noncycling cells appear very similar to those observed in starved cultures. The cycling populations, however, progress peristaltically in an exceptionally synchronous manner, reflecting the intermittent feeding regimen. These nonexpanding, yet actively growing fed populations continue to produce nonviable daughters, which are later observed as Feulgen-positive debris.

Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Photons passing through human tissue undergo attenuation in relation to the specific chemical substances with which they interact. By selecting two appropriate photon energies and recording their attenuation, the investigator can solve simultaneous equations that subdivide body mass into two components: soft tissue and bone mineral ash. The aim of this paper is to describe and to validate the estimates of body composition derived by dual photon systems. The initial studies largely involved dual photon absorptiometers, although the discussion will also include the more recently developed dual energy x-ray absorptiometers. 13 refs., 7 figs., 4 tabs.

22723 **Activation of formylmethanofurna synthesis in cell extracts of Methanobacterium thermoautotrophicum.** Bobik, T.A. (Univ. of Illinois, Urbana (USA)); Wolfe, R.S. *Journal of Bacteriology (USA),* 171(3): 1423-1427 (Mar 1989).

In cell extracts of Methanobacterium thermoautotrophicum, formylmethanofuran (formyl-MFR) synthesis (an essential CO_2 fixation reaction that is an early step in CO_2 reduction to methane) is subject to a complex activation that involves a heterodisulfide of coenzyme M and N-(7-mercaptoheptanoyl)threonine O^3-phosphate (CoM-S-S-HTP). In this paper we report that titanium(III) citrate, a low-potential reducing agent, stimulated CO_2 reduction to methane and activated formyl-MFR synthesis in cell extracts. Titanium(III) citrate functioned as the sole source of electrons for formyl-MFR synthesis and enabled this reaction to occur independently of CoM-S-S-HTP. In addition, CoM-S-S-HTP was found to activate an unknown electron carrier that reduced metronidazole. The activation of formyl-MFR synthesis by CoM-S-S-HTP may involve the activation of a low-potential electron carrier.

Although the emphasis in our original submission was on N_2S_2 and N_3S coordinating ligands in technetium(V), we have now broadened the chemistry studies into areas that encompass new systems that allow the generation of neutral complexes. This change was based upon developments that have taken place in our basic chemistry studies that could bear on one of the original aims of this work, i.e., the design of complexes designed to penetrate cellular membranes and to remain trapped in target tissues. Among these topics are oxotechnetium(V) complexes containing amine and alcoholate ligands, coordination compounds containing the alternative technetium(V) nitrido core and the synthesis at macroscopic levels of a tetradentate "umbrella" ligand that successfully binds the metal. Basic studies with the original bisamide-bisthiol ligand system have continued with the identification of the products formed when aqueous solutions of the complex $[TcO(ema)]^-$ are acidified. This material is isolatable as yellow/brown crystals when HCl is added to the tetraphenylarsonium salt of the complex synthesized according to published procedures. Elemental analysis, FAB(+) mass spectrometry and ^1H NMR results were consistent with the formulation TcO(ema)H. Infrared spectra showed a dramatic shift in the Tc = O stretch to 966 cm^{-1}, as distinct from 945 cm^{-1} in the original complex.

The Biomed Control System is a hardware/software system used for the delivery, measurement and monitoring of heavy-ion beams in the patient treatment and biology experiment rooms in the Bevalac at the Lawrence Berkeley Laboratory (LBL). This paper describes some aspects of this system including historical background philosophy, configuration management, hardware features that facilitate software testing, software testing procedures, the release of new software quality assurance, safety and operator monitoring. 3 refs.

22726 (LBL–28249) **Clinical results of stereotactic helium-ion radiosurgery of the pituitary gland at Lawrence Berkeley**

Laboratory. Levy, R.P.; Fabrikant, J.I.; Lyman, J.T.; Frankel, K.A.; Phillips, M.H.; Lawrence, J.H.; Tobias, C.A. Lawrence Berkeley Lab., CA (USA). Dec 1989. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8906298–1: International workshop on proton and narrow photon beam therapy, Oulu (Finland), 8-10 Jun 1989). Order Number DE90008465. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The first therapeutic clinical trial using accelerated heavy-charged particles in humans was performed at Lawrence Berkeley Laboratory (LBL) for the treatment of various endocrine and metabolic disorders of the pituitary gland, and as suppressive therapy for adenohypophyseal hormone-responsive carcinomas and diabetic retinopathy. In acromegaly, Cushing's disease, Nelson's syndrome and prolactin-secreting tumors, the therapeutic goal in the 433 patients treated has been to destroy or inhibit the growth of the pituitary tumor and control hormonal hypersecretion, while preserving a functional rim of tissue with normal hormone-secreting capacity, and minimizing neurologic injury. An additional group of 34 patients was treated for nonsecreting chromophobe adenomas. This paper discusses the methods and results of stereotactic helium-ion radiosurgery of the pituitary gland at Lawrence Berkeley Laboratory. 11 refs.

22727 (LBL–28250) **Heavy charged-particle beams for stereotactic radiosurgery.** Lyman, J.; Phillips, M.; Frankel, K.; Fabrikant, J.; Levy, R. Lawrence Berkeley Lab., CA (USA). Dec 1989. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8906298–2: International workshop on proton and narrow photon beam therapy, Oulu (Finland), 8-10 Jun 1989). Order Number DE90008466. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

A number of characteristics of the interactions of charged particles with matter make them well-suited for stereotactic radiosurgery. The depth-dose distribution is characterized by the Bragg ionization peak. The Bragg Peak is too narrow for the treatment of most targets of interest however, the range of the beam can be modulated to move the Bragg peak from a single entry direction, to different depths to produce a high-dose region at the desired depth. The range of the beam along different rays through the target can be differentially modulated to conform the distal portion of the high-dose region to the distal surface of the target volume. This document discusses an advanced beam delivery system, under development at the Lawrence Berkeley Laboratory, will make possible the conformation of the proximal high-dose region to the proximal surface of the target volume. Included are the methods, materials, discussion and conclusions. 14 refs., 1 fig., 1 tab.

22728 (LBL–28251) **Effects of target size on the comparison of photon and charged particle dose distributions.** Phillips, M.H.; Frankel, K.A.; Tjoa, T.; Lyman, J.T.; Fabrikant, J.I.; Levy, R.P. Lawrence Berkeley Lab., CA (USA). Dec 1989. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8909244–2: International heavy particle therapy workshop, Villigen (Switzerland), 18-20 Sep 1989). Order Number DE90007777. Available from NTIS, PC A02/MF A01; OSTI; INIS.

The work presented here is part of an ongoing project to quantify and evaluate the differences in the use of different radiation types and irradiation geometries in radiosurgery. We are examining dose distributions for photons using the "Gamma Knife" and the linear accelerator arc methods, as well as different species of charged particles from protons to neon ions. A number of different factors need to be studied to accurately compare the different modalities such as target size, shape and location, the irradiation geometry, and biological response. This presentation focuses on target size, which has a large effect on the dose distributions in normal tissue surrounding the lesion. This work concentrates on dose distributions found in radiosurgery, as opposed to those usually found in radiotherapy. 5 refs., 2 figs.

22729 (LBL–28253) **Clinical results of stereotactic helium-ion radiosurgery of the pituitary gland at Lawrence Berkeley Laboratory.** Levy, R.P.; Fabrikant, J.I.; Lyman, J.T.; Frankel, K.A.; Phillips, M.H.; Lawrence, J.H.; Tobias, C.A. Lawrence Berkeley Lab., CA (USA). Dec 1989. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8905227–6: International conference on radiosurgery a neurosurgical approach to intracranial lesions, Charlottesville, VA (USA), 1-5 May 1989). Order Number DE90008467. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The first therapeutic clinical trial using accelerated heavy-charged particles in humans was performed for the treatment of various endocrine and metabolic disorders of the pituitary gland, and as suppressive therapy for adenohypophyseal hormone-responsive carcinomas and diabetic retinopathy. Since then, over 800 patients have received stereotactically-directed plateau-beam heavy-charged particle pituitary irradiation at this institution. In acromegaly, Cushing's disease, Nelson's syndrome and prolactin-secreting tumors, the therapeutic goal in the 433 patients treated has been to destroy or inhibit the growth of the pituitary tumor and control hormonal hypersecretion, while preserving a functional rim of tissue with normal hormone-secreting capacity, and minimizing neurologic injury. An additional group of 34 patients was treated for nonsecreting chromophobe adenomas. This paper discusses the methods and results of these treatments. 11 refs.

22730 (LBL–28254) **Clinical results of stereotactic heavy-charged-particle radiosurgery for intracranial angiographically occult vascular malformations.** Levy, R.P.; Fabrikant, J.I.; Phillips, M.H.; Frankel, K.A.; Steinberg, G.K.; Marks, M.P.; DeLaPaz, R.L.; Chuang, F.Y.S.; Lyman, J.T. Lawrence Berkeley Lab., CA (USA). Dec 1989. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8905227–5: International conference on radiosurgery a neurosurgical approach to intracranial lesions, Charlottesville, VA (USA), 1-5 May 1989). Order Number DE90007756. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Angiographically occult vascular malformations (AOVMs) of the brain have been recognized for many years to cause neurologic morbidity and mortality. They generally become symptomatic due to intracranial hemorrhage, focal mass effect, seizures or headaches. The true incidence of AOVMs is unknown, but autopsy studies suggest that they are more common than high-flow angiographically demonstrable arteriovenous malformations (AVMs). We have developed stereotactic heavy-charged-particle Bragg peak radiosurgery for the treatment of inoperable intracranial vascular malformations, using the helium ion beams at the Lawrence Berkeley Laboratory 184-inch Synchrocyclotron and Bevatron. This report describes the protocol for patient selection, radiosurgical treatment planning method, clinical and neuroradiologic results and complications encountered, and discusses the strengths and limitations of the method. 10 refs., 1 fig.

22731 (LBL–28255) **Clinical-radiological evaluation of sequelae of stereotactic radiosurgery for intracranial arteriovenous malformations.** Levy, R.P.; Fabrikant, J.I.; Frankel, K.A.; Phillips, M.H.; Steinberg, G.K.; Marks, M.P.; DeLaPaz, R.L.; Chuang, F.Y.S. Lawrence Berkeley Lab., CA (USA). Dec 1989. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8905227–7: International conference on radiosurgery a neurosurgical approach to intracranial lesions, Charlottesville, VA (USA), 1-5 May 1989). Order Number DE90008496. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Stereotactic heavy-charged-particle Bragg peak radiosurgery has been used to treat 322 patients with surgically-inaccessible intracranial vascular malformations. (The clinical results of this method for the treatment of angiographically demonstrable arteriovenous malformations (AVMs) and angiographically occult vascular malformations (AOVMs) of the brain are described in separate reports of this symposium). The great majority of patients have had an uneventful post-treatment course with satisfactory health outcomes. However, several categories of delayed sequelae of stereotactic radiosurgery have been identified, involving the vascular structures essential for the integrity of the brain tissue and the brain parenchyma directly. These categories reflect both reaction to injury and to alterations in regional hemodynamic status, and include vasogenic edema, occlusion of functional vasculature, radiation necrosis, and local or remote effects on cerebral arterial aneurysms. 10 refs., 7 figs., 1 tab.

22732 (PB–90-131624/XAB) **Follow-up study of persons who had iodine-131 and other diagnostic procedures during childhood and adolescence.** Hamilton, P.M.; Chiacchierini, R.P.;

Kaczmarek, R.G. Food and Drug Administration, Rockville, MD (USA). Center for Devices and Radiological Health. Aug 1989. 46p. (DHHS/PUB/FDA–89-8276). Available from NTIS, PC A03/MF A01.

A prospective study of 3,503 children and adolescents who received diagnostic doses of iodine-131 was conducted to evaluate the risk of radiation-induced thyroid neoplasia. The exposed group was followed for a total of 93,442 person-years. Thyroid doses received by the exposed group ranged from less than 10 rads to slightly more than 2,000 rads. The majority received less than 100 rads. A group of 2,594 children and adolescents who were not exposed to radioactive iodine comprised the control group for the study. Members of the control group were followed for a total of 66,797 person-years. An elevated risk of malignant thyroid tumors was observed in the exposed group. An increased risk of benign thyroid conditions was also noted in the exposed group. The results described above failed to fulfill the requirements for statistical significance because of the small number of cases but are suggestive of a radiation effect.

22733 (PB–90-130139/XAB) **Byssinosis and small airways disease: Terminal progress report.** Bradford, J.M. Emory Univ., Atlanta, GA (USA). 1989. 37p. Available from NTIS, PC A03/MF A01.

In a study of byssinosis and small-airway disease, pulmonary-function measurements including helium and oxygen flow volume curves were made on 470 cotton mill employees exposed to various dust levels. The employees in these cotton mills had been screened previously for pulmonary abnormalities, and some employees had moved to work areas with lower dust levels. Results showed that there was no significant increase in bronchitis or byssinosis in the dust areas nor were there any significant decreases in the percentages of normal forced vital capacity (PFVC) or forced expiratory volume in 1 second (PFEV1) in the dusty areas. These results differ from those reported from mills in which no previous pulmonary testing had been conducted. A strong smoking/tenure/dust exposure interaction on PFVC and PFEV1 was found, with the long-tenured, high-dust-exposure, smokers having the lowest PFVC and PFEV1. There was no significant increase in small airways abnormalities with increased dust and smoking, but the mean change in the density dependence ratio is too small to have clinical significance.

22734 (PB–90-133125/XAB) **NIOSH (National Institute for Occupational Safety and Health) testimony on occupational diseases before the Senate Committee on Labor and Human Resources, by Anthony Robbins, April 2, 1979.** National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). 2 Apr 1979. 18p. Available from NTIS, PC A03/MF A01.

The testimony considered National Institute for Occupational Safety and Health (NIOSH) research efforts designed to determine whether illness and injury are job-related. Since 1970 when the Occupational Safety and Health Act was passed, awareness has increased that chemical and physical agents play a role in the etiology of disease. A survey conducted in 1972 to 1974 indicated that one in four American workers was potentially exposed either full or part time to hazardous substances regulated by OSHA. Often illnesses were improperly diagnosed, resulting in difficulties of accurately determining the magnitude of the problem. Most of the past research has centered on the effect of exposure to one agent at a time, but most occupational exposures were to multiple agents, simultaneously. A suggested approach to developing occupational-disease standards involved the determination of whether the workers have symptoms compatible with the effects of occupational exposure and whether the workers had received sufficient exposure to cause the disease. Specific efforts that have been directed toward the specific substances and advancements which have thus been made were detailed for asbestos, cotton dust exposure, toluene-diisocyanate, and dibromochloropropane. Brief mention was made of a respiratory disease report, criteria for diagnosing occupational disease, and strategies for prevention.

22735 (IAEA-R–5462-F) **Development of ^{99m}Tc-labelled the d,1-diastereoisomer of HM-PAO for cerebral blood flow imaging: Final report for the period 15 December 1988 - 22 July 1989.** Lun Xiao. Academia Sinica, Beijing, BJ (China). Inst. of Atomic Energy; International Atomic Energy Agency, Vienna (Austria). Oct 1989. 35p. (CONF-8709362–: 4. working meeting on radiation interaction, Leipzig (German Democratic Republic), 21-25 Sep 1987). Order Number DE90617634. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The d,1-diastereoisomer of hexamethyl propyleneamine oxime (HM-PAO) was selected as the preferred ligand for Tc-99m as a radiotracer for cerebral perfusion imaging. Further improvement of the synthesis and isolation method of HM-PAO resulted in pure d,1-HM-PAO and pure meso-HM-PAO. The neutral, lipophilic Tc-99m complexes of d,1-HM-PAO and meso-HM-PAO were formed in high yield by stannous reduction of Mo-99/Tc-99m generator eluate, respectively. Two minutes following i.v. administration of Tc-99m-d,1-HM-PAO in mice, 2.24% of the injected dose appears in the brain. Little washout of the tracer is observed up to 24-hour post injection. Two minutes following i.v. administration of Tc-99m-meso-HM-PAO in mice, 1.9% of the injected dose appears in the brain. The radioactivity of Tc-99m-meso-HM-PAO declined faster than that of Tc-99m-d,1-HM-PAO did in the brain up to 24-hour post injection. 12 refs, 5 figs, 5 tabs.

22738 (AD-A-214519/1/XAB) **Benzamide prevention of ultraviolet radiation-induced transformation as measured by anchorage-independent growth and absence of correlation with thymidine dimer formation and DNA repair.** Milo, G.E.; d'Ambrosio, S.; Kun, E. San Francisco State Univ., CA (USA). 1989. 11p. Available from NTIS, PC A03/MF A01.

Pub. in Teratogenesis, Carcinogenesis, and Mutagenesis, Vol. 9, 167-176(1989).

Synchronized human fibroblasts were exposed in early S phase to increasing doses of ultraviolet (UV) irradiation in the presence and absence of an antitransforming drug, benzamide. Cellular survival, initial thymidine dimer formation and its repair, and cellular phenotypic transformation were simultaneously monitored in the presence and absence of 1 mM externally added benzamide that reaches 8 to 15 microns intracellular levels. Cellular transformation as measured by an expression of anchorage-independent growth was inhibited by nontoxic doses of benzamide. Antitransforming action of benzamide is confined to low intracellular drug concentrations, which in the case of benzamide is in the 4-9 micons range. Because of the lack of effect of benzamide of the formation of UV-induced thymidine dimers and the specific repair of these dimers, these results suggest that the processes of thymidine dimer formation and its repair are not involved in the mode of action of benzamide that influences the expression of a transformed phenotype with low malignant vigor.

22739 (AD-A-214524/1/XAB) **Survival after total-body irradiation. 1. Effects of partial small bowel shielding.** Vigneulle, R.M.; Vriesendorp, H.M.; Taylor, P.; Burns, W.; Pelkey, T. Armed Forces Radiobiology Research Inst., Bethesda, MD (USA). 1989. 13p. (AFRRI-SR-89-39). Available from NTIS, PC A03/MF A01.

Pub. in Radiation Research, Vol. 119, 313-324(1989).

The small intestine of the rat was shielded during total-body irradiation (TBI) to evaluate the effects of radiation dose and length of intestine shielded on survival. Sprague-Dawley rats were anesthetized in groups of 10. Using aseptic surgical procedures 80, 40, 20, or 10 cm, or none of the proximal or distal small intestine were temporarily exteriorized and shielded during irradiation with photons from an 18-MeV linear accelerator. Less than 17% of the dose was delivered to the shielded intestines. In unshielded animals deaths occurred from Days 4 to 6 with 13, 15, or 17 Gy and from Days 8 to 30 with 9, 11, and 12 Gy. However, in all animals exposed to 15 Gy with all or part of the small intestine shielded, survival was increased to between 5 and 9 days. Shielding of the distal small intestine. The previously identified target of radiation damage in the small intestine is the crypt stem cell. In this study, the analysis of histological specimens of shielded and irradiated small intestine suggested that humoral factors also influence intestinal histology and survival after irradiation. These humoral factors are thought to originate from the irradiated body tissues, the shielded proximal intestine, and the shielded distal intestine. Further studies are required to identify these factors and to determine their mode of action and their therapeutic potential after radiation damage to the small intestine.

22740 (AD-A-214558/9/XAB) **Effect of ultraviolet radiation on the energy metabolism of the corneal epithelium of the rabbit. Final report.** Lattimore, M.R. Army Aeromedical Research Lab., Fort Rucker, AL (USA). Sep 1989. 14p. (USAARL-89-26). Available from NTIS, PC A03/MF A01.

Pub. in Photochemistry and Photobiology, Vol. 49, No. 2, 175-180(1989).

The present research was directed at quantifying possible alterations in corneal epithelial metabolic activity secondary to in-vivo exposure to ultraviolet radiation (UVR). Microfluorometric energy metabolite assays on microgram (ug) sized, freeze-dried tissue samples were used as an in vitro means of assessing overall metabolic activity in the epithelium of control rabbit corneas and in the epithelium of UVR-exposed rabbit corneas 2 min after discontinuation of exposure. The specific assays were for glucose, glycogen, adenosine triphosphate (ATP), and phosphocreatine (PCr). The radiant exposures were kept constant at 0.05 J cm-2 for all UVR wavelengths utilized (290, 300, 310 and 360 nm). Experimental UVR exposure conditions served to increase epithelial glucose and glycogen concentrations. Although the epithelial ATP concentrations were unchanged, the epithelial PCr concentrations (a high energy phosphate bond reservoir) decreased as a result of UVR exposure. Overall, the data demonstrate a decrease in corneal epithelial metabolic activity, which may be wavelength-dependent, as a result of UVR exposure. It is suggested that immediate metabolic stress can be responsible for the pattern of epithelial cell loss seen in photokeratitis.

22741 (AD-A-214960/7/XAB) **AFRRI (Armed Forces Radiobiology Research Institute) reports, July, August, September 1989. Technical report.** Armed Forces Radiobiology Research Inst., Bethesda, MD (USA). Nov 1989. 147p. Available from NTIS, PC A07/MF A01.

Includes rept. nos. AFRRI-SR89-26 through AFRRI-SR89-39 and AFRRI-TR89-1.

This volume contains AFRRI Scientific Reports SR 89-26 through SR89-39 and Technical Report TR89-1 for Jul-Sep 1989. Partial contents include: Induction of marrow hypoxia by radioprotective agents; Cell-cycle radiation response: Role of intracellular factors; Characteristics of radiation-induced performance changes in bar-press avoidance with and without a preshock warning cue; Norepinephrine-induced phosphorylation of a 25 kd phosphoprotein in rat aorta is altered in intraperitoneal sepsis; Quantitative measurement of radiation-induced base products in DNA using gas chromatography-mass spectrometry; Tropism of canine neutrophils to xanthine oxidase; Effects of acute sublethal gamma radiation exposure on aggressive behavior in male mice: A dose-response study; Progressive behavioral changes during the maturation of rats with early radiation-induced hypoplasia of fascia dentata granule cells; Stomach nodules in pigeons; An assessment of the behavioral toxicity of high-energy iron particles compared to other qualities of radiation; L-leucyl-L-leucine methyl ester treatment of canine marrow and peripheral blood cells; Localization of cyclooxygenase and prostaglandin E2 in the secretory granule of the mast cell; Radioprotection of mice with interleukin-1: Relationship to the number of spleen colony-forming units; Survival after total-body irradiation. I. Effects of partial small-bowel shielding; Laboratory x-ray irradiator for cellular radiobiology research studies: Dosimetry report.

22742 (AERE-R-13220) **The distribution and uptake of rare-earth elements in the food chain and their use as analogues for the transuranic elements: A literature review.** Dalgarno, B.G. UKAEA Harwell Lab. (UK). Environmental and Medical Science Div. Jul 1988. 38p. Available from H.M. Stationery Office, London, price Pound 10.00. Available from H.M. Stationery Office, London, price Pound 10.00.

A literature review has been undertaken into the distribution and uptake of rare-earth elements in the food chain and their use as analogues for the transuranic elements. Much of the value derived from using rare-earth elements in 'potential analogue' experiments is based on the effective invariance of the stable oxidation state in the environment (+3). With regard to the uptake by plants, it may be concluded that the complete series of elements behaves as a continuous function of the ionic radius. Consequently, it may be inferred that the plant uptake of other ions with similar physicochemical properties such as the transuranic elements, would also be determined by the ionic charge and radius. A primary aim has been to determine the abundance of the rare-earth elements in the environment so that an assessment may be made as to the feasibility of their use in the study of human-uptake of transuranic elements. Needs have been identified for more information on the concentration of rare earth elements in foodstuffs and in human biological fluids including blood, urine and milk. (author).

22743 (BMU–1989-217) **Transfer of Cs-137 from food into milk of breast-feeding women.** Schriftenreihe Reaktorsicherheit und Strahlenschutz. Ergebnisberichte, Untersuchungen, Studien, Gutachten. Gall, M.; Mahler, S.; Wirth, E. Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany, F.R.); Bundesgesundheitsamt, Berlin (Germany, F.R.). Inst. fuer Strahlenhygiene. Jan 1988. 14p. (In German). Contract BMU St.Sch. 1037. Available from GRM Werbeberatung - Werbemittlung - PR, Eggenstein-Leopoldshafen, (Germany, F.R.). Available from GRM Werbeberatung - Werbemittlung - PR, Eggenstein-Leopoldshafen, (Germany, F.R.).

Between May 1987 and May 1988 a duplicate of the food taken in as well as a specimen of the milk of 8 nursing mothers was daily collected during 3-4 weeks and the Cs 137 activity was measured. Moreover the mothers' whole-body activity was measured once during the collection period. The measured values show that apart from the direct transfer of Cs 137 from the food taken in into the breast milk a transfer of cellular Cs 137 from the mother's body into the breast milk is also taking place. During this process about 12% of the mother's Cs 137 activity concentration and about 19% of the Cs 137 activity daily taken in with the food are transferred into one liter of breast milk. (orig.).

22744 (BMVg-FBWM–89-18) **Investigations into the suppression of the nonspecific defence system by ionising radiation.** Pawlas, S.; Mayr, A. Muenchen Univ. (Germany, F.R.). Inst. fuer Medizinische Mikrobiologie, Infektions- und Seuchenmedizin; Bundesministerium der Verteidigung, Bonn (Germany, F.R.). 10 Mar 1988. 61p. (In German). Contract InSan I 0585-V-4387. Available from Bundesministerium der Verteidigung, Bonn (Germany, F.R.). Dokumentations- und Fachinformationszentrum der Bundeswehr (DOKFIZBw). Available from Bundesministerium der Verteidigung, Bonn (Germany, F.R.). Dokumentations- und Fachinformationszentrum der Bundeswehr (DOKFIZBw).

While nonspecific mechanisms such as activity of NK-cells and induction of interferon were not suppressed after inhomogenous total body irradiation of mice with 1,95/3,90 and 5,85 Gy, an extreme decrease in spleen weight, in the yield of lymphocytes from the spleen and their response to mitogenic stimulation was observed. The general effect of these influences on the interaction of the numerous factors and mechanisms of the nonspecific part of defence was investigated in an antigen-challenge model with stomatitis vesicularis virus in babymice after total body irradiation (3,90 Gy) of the babymice or their pregnant mothers. Irradiation of the babymice showed no significant influence on mortality after infection, while irradiation of their pregnant mothers caused an astonishing decrease of mortality compared to that of animals with no exposure to X-rays. In the same model it was demonstrated that the protective effect of the paramunity inducer 'PIND ORF' on mortality after infection was impaired neither by irradiation of the babymice nor by irradiating their pregnant mothers. The antigen-challenge model Aujeszky virus/adult mouse (exposure to 1,95/3,90 and 5,85 Gy) proved that the influence of irradiation not only depends on the dose but also on the moment of the exposure. The behaviour of opportunistic germs (P. multocida, Ps. aeruginosa) and vaccination viruses (Vaccinia virus, strain Elstree and MVA) in mice remained unchanged after irradiation with 1,95/3,90 Gy, whereas irradiation with 5,85 Gy caused a varying increase of mortality after infection with P. multocida and Ps. aeruginosa. (orig./MG) With 5 refs., 11 tabs.

22745 (BNL–43715) **Is natural background or radiation from nuclear power plants leukemogenic?.** Cronkite, E.P. Brookhaven National Lab., Upton, NY (USA). [1989]. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-8910360–1: 15. annual Frederick Stohlman Jr., M.D. memorial symposium, Cambridge, MA (USA), 15-20 Oct 1989). Order Number DE90006531. Available from NTIS, PC A02/MF A01; OSTI; INIS.

The objective in this review is to provide some facts about normal hemopoietic cell proliferation relevant to leukemogenesis, physical, chemical, and biological facts about radiation effects with the hope that each person will be able to decide for themselves whether background radiation or emissions from nuclear power plants and facilities significantly add to the spontaneous leukemia incidence. 23 refs., 1 tab.

22746 (CEA-R–5485) **^{60}Co accumulation by scenedesnus obliquus. Mechanism of uptake and relative contribution of radionuclide adsorption and absorption.** Nucho, R.; Baudin, J.P. CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-lez-Durance (France). Jun 1989. 30p. (In French). Order Number DE90756426. Available from NTIS (US Sales Only), PC A03/MF A01.

In this paper are presented the results of various ^{60}Co accumulation and depuration experiments, carried out to assess the respective contributions of passive and active processes in the radionuclide uptake by Scenedesmus obliquus. The experiments were conduced on living illuminated cells, living cells maintained in darkness and dead cells. Exposure study shows that living illuminated cells and dead cells incorporated the same amount of available ^{60}Co, in the order of 65%. In contrast, the radionuclide uptake by cells in darkness was very lower. Depuration experiments show that radiocobalt release by living illuminated cells and dead cells is an exponential process including two phases. The first, during which the decrease of the radioactivity was about 80%, corresponds to elimination of the ^{60}Co adsorbed on the cell walls. During the second phase, the slight decrease of the radioactivity results from the intracellular ^{60}Co desorption. The addition of EDTA in the depuration culture medium results in an almost instantaneous loss of 80% of the accumulated radionuclide. The results clearly indicate that ^{60}Co uptake is mainly a passive phenomenon, since adsorption accounts for 80% of the accumulation and passive diffusion for about 10%. Metabolic assimilation contributes for a weak part.

22747 (CEGB-RD-B–6122/R89) **Skin carcinogenesis following uniform and non-uniform β irradiation.** Charles, M.W. (Saint Bartholomew's Hospital, London (UK)); Williams, J.P.; Coggle, J.E. Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs. Jan 1989. 19p. Order Number DE90619589. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Where workers or the general public may be exposed to ionising radiation, the irradiation is rarely uniform. The risk figures and dose limits recommended by the International Commission on Radiological Protection (ICRP) are based largely on clinical and epidemiological studies of reasonably uniform irradiated organs. The paucity of clinical or experimental data for highly non-uniform exposures has prevented the ICRP from providing adequate recommendations. This weakness has led on a number of occasions to the postulate that highly non-uniform exposures of organs could be 100,000 times more carcinogenic than ICRP risk figures would predict. This so-called "hot-particle hypothesis" found little support among reputable radiobiologists, but could not be clearly and definitively refuted on the basis of experiment. An experiment, based on skin tumour induction in mouse skin, is described which was developed to test the hypothesis. The skin of 1200 SAS/4 male mice has been exposed to a range of uniform and non-uniform sources of the β emitter ^{170}Tm ($E_{max} \approx 1$ MeV). Non-uniform exposures were produced using arrays of 32 or 8 2-mm diameter sources distributed over the same 8-cm^2 area as a uniform control source. Average skin doses varied from 2-100 Gy. The results for the non-uniform sources show a 30% reduction in tumour incidence by the 32-point array at the lower mean doses compared with the response from uniform sources. The eight-point array showed an order-of-magnitude reduction in tumour incidence compared to uniform irradiation at low doses. These results, in direct contradiction to the "hot particle hypothesis", indicate that non-uniform exposures produce significantly fewer tumours than uniform exposures. (author).

22748 (CONF-900224–4) **Whole body counting of radon daughters.** Schlenker, R.A.; Essling, M.A.; Stebbings, J.H.; Lucas, H.F. Argonne National Lab., IL (USA). [1990]. 11p. Sponsored by U.S. Department of Health and Human Services. DOE Contract W-31109-ENG-38. From International symposium on radon and radon reduction technology; Atlanta, GA (USA); 19-23 Feb 1990. Order Number DE90007790. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This paper reports the initial work in a series of experiments involving experimental exposure to radon and radon daughter products in an exposure chamber. Five adult males were exposed for

one hour to radon and radon daughter products in an exposure chamber and were subsequently measured for radon daughter product activity in the chest region by whole body counting methods. About half of the deposited activity was associated with internal deposition and half with external deposition on clothing, skin and hair. A substantial contribution was made to the counting rate from deposits on under as well as outer clothing. A strong but statistically non significant correlation was found between internal and external deposition indicating that total activity provides an index of internal deposition. 2 refs., 3 figs., 4 tabs.

22749 (CONF-8811313–1) **Implementing a new TLD system.** Rhea, T.A. Oak Ridge National Lab., TN (USA). [1988]. 22p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 2. annual Harshaw TLD user's group meeting; Myrtle Beach, SC (USA); 13-16 Nov 1988. Order Number DE90007656. Available from NTIS, PC A03/MF A01; OSTI; INIS.

Martin Marietta Energy Systems will soon be issuing new personnel dosimeters at four of their five Department of Energy (DOE) facilities, The Piketon, Ohio uranium enrichment facility is not included in this dosimetry upgrade program. This talk will focus on the ORNL perspective of this program, especially the new beta-gamma dosimeter. Neutron dosimetry will be discussed briefly. The objective of this upgrade is to put in place a state-of-the-art personnel dosimetry system and to meet the recent DOE Laboratory Accreditation Program performance criteria. Processing such a large number of dosimeters will require stringent quality controls. Approximately 18,000 beta-gamma dosimeters are scheduled for issue in January 1989. 15 figs.

22750 (CONF-8909210–8) **Calculations of Auger-cascade-induced reactions with DNA in aqueous solution.** Hamm, R.N. (Oak Ridge National Lab., TN (USA)); Wright, H.A.; Turner, J.E.; Howell, R.W.; Rao, D.V.; Sastry, K.S.R. Oak Ridge National Lab., TN (USA). [1989]. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 12. Werner Brandt international workshop on charged particle penetration phenomena; San Sebastian (Spain); 4-7 Sep 1989. Order Number DE90008747. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The biological effects of radionuclides incorporated into mammalian cells are of considerable interest for radiation biology and radiation protection. Simulation of the nuclear and atomic events associated with the decay of several Auger-electron-emitting radionuclides was accomplished using Monte Carlo calculational techniques. Calculations of the energies of Auger electrons produced from a number of decays have been performed for the radionuclides Pt-195m, Pt-193m, I-125, In-111, and Fe-55. The Monte Carlo radiation transport code OREC (8, 11-13) has been used to transport the electrons produced during the Auger cascades through liquid water surrounding the decay site and to calculate the physical and chemical interactions produced. In order to estimate the interactions that might be produced with a DNA molecule, a very simple model has been assumed. A segment of double-stranded DNA is represented as a right circular cylinder of radius 1 nm with "sugar" and "base" reactive sites alternating along two helical strands on the surface. For the purposes of this paper two types of interactions with the DNA are considered. During the charged-particle transport the DNA cylinder is treated as though it were water, and if an inelastic energy loss event occurs within the cylinder it is considered to represent a "direct" physical event. An "indirect" chemical event is considered to result when a reactive chemical species interacts with a "sugar" or "base" site on the DNA. Although no attempt is made to identify the consequences of these direct or indirect events, it is interesting to compare the relative numbers of such events for various types of radiation. 13 refs., 4 figs.

22751 (DOE/EH–0128) **Radiation exposures for DOE and DOE contractor employees, 1987: Twentieth annual report.** Pacific Northwest Lab., Richland, WA (USA). Oct 1989. 55p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract AC06-76RL01830. Order Number DE90006342. Available from NTIS, PC A04/MF A01; OSTI; INIS; GPO Dep.

This report is one of series of annual reports provided by the US Department of Energy (DOE) summarizing occupational radiation exposures received by DOE and DOE contractor employees. These reports provide an overview of radiation exposures received each year, as well as identification of trends in exposures being experienced over the years. 5 figs., 30 tabs.

22752 (INIS-mf–11551) **The influence of fractionation and repair kinetics on radiation tolerance: Studies on rat lung and kidney.** Rongen, E. van. Amsterdam Univ. (Netherlands). 8 Jun 1989. 159p. Order Number DE90706043. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

The effect of irradiation of biological tissues is described as the sum of a linear and a quadratic function of the radiation dose, in which α and β and β are denoted as the coefficients of the linear and quadratic terms respectively. The rate of repair of radiation damage is expressed by the half-life time T 1/2. The purpose of the study described in the thesis was to determine the α/β and T 1/2 values for early and late effects in lungs and kidneys of the rat. Rats have been irradiated upon one or both organs in various numbers of fractions, which have been administered with long or short time intervals in order to obtain respectively complete and incomplete repair. From the results, values for α/β and T 1/2 could be obtained by means of computer codes. The results of this investigation indicate that for the lung differences exist in α/β for early and late effects. The α/β value for early effects being larger:3.5 Gy, than the one for late effects: 2.3 Gy. The values for T 1/2 were respectively 1.0 hour for early and 1.1 hour for late effects. The kidney experiments resulted in equal α/β values for early and late effects: respectively, 1.7 and 1.8 Gy. The T 1/2 values, however, differed being respectively, 1.6 hour and 2.1 hour. Also the influence of the fraction dose upon the α/β and T 1/2 values was investigated. For the lung such effects have not been found. In the kidney only between 20 and 40 weeks after the irradiation differences were observed, which disappeared after this period. The results of this investigation indicate that, in radiotherapy of tumors where lungs and kidneys are contained in the radiation field a scheme following which a large number of small fractions are administered, would give therapeutical advantage with respect to standard therapy. (HW) 240 refs., 38 figs., 37 tabs.

22753 (LA–11740-MS) **High-energy neutron dosimetry at the Clinton P. Anderson Meson Physics Facility.** Mallett, M.W.; Vasilik, D.G.; Littlejohn, G.J.; Cortez, J.R. Los Alamos National Lab., NM (USA). Jan 1990. 19p. Sponsored by U.S. DOE Management & Administration. DOE Contract W-7405-ENG-36. Order Number DE90006346. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Neutron energy spectrum measurements performed at the Clinton P. Anderson Meson Physics Facility indicated potential areas for high energy neutron exposure to personnel. The low sensitivity of the Los Alamos thermoluminescent dosimeter (TLD) to high energy neutrons warranted issuing a NTA dosimeter in addition to the TLD badge to employees entering these areas. The dosimeter consists of a plastic holder surrounding NTA film that has been desiccated and sealed in a dry nitrogen environment. A study of the fading of latent images in NTA film demonstrated the success of this packaging method to control the phenomenon. The Los Alamos NTA dosimeter is characterized and the fading study discussed. 10 refs., 4 figs., 2 tabs.

22754 (LA-UR–90-419) **Laser-produced plasmas in medicine.** Gitomer, S.J.; Jones, R.D. Los Alamos National Lab., NM (USA). [1990]. 15p. Sponsored by U.S. Department of Defense. DOE Contract W-7405-ENG-36. (CONF-900178–2: Biomedical optics '90, Los Angeles, CA (USA), 14-19 Jan 1990). Order Number DE90007623. Available from NTIS, PC A03/MF A01 - OSTI.

The laser has found numerous applications in medicine, beginning with uses in ophthalmology in the 1960's. Today, lasers are used in tissue cutting, blood coagulation, photo-dynamic cancer therapy, arterial plaque removal, dental drilling, etc. In this paper, we examine those areas of laser medicine in which plasmas (ionized gases) are produced. In fact, the presence of a plasma is essential for the application at hand to succeed. We consider examples of the plasmas produced in ophthalmology (e.g., lens membrane destruction following cataract surgery), in urology and gastroenterology (e.g., kidney and gall stone ablation and fragmentation) and in cardiology and vascular surgery (e.g., laser ablation

and removal of fibro-fatty and calcified arterial plaque). Experimental data are presented along with some results from computer simulations of the phenomena. Comments on future directions in these areas are included. 63 refs.

22755 (LBL–27460) **Life sciences: Lawrence Berkeley Laboratory, 1988.** Lawrence Berkeley Lab., CA (USA). Jul 1989. 76p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE90008061. Available from NTIS, PC A05/MF A01; OSTI; INIS; GPO Dep.

Life Sciences Research at LBL has both a long history and a new visibility. The physics technologies pioneered in the days of Ernest O. Lawrence found almost immediate application in the medical research conducted by Ernest's brother, John Lawrence. And the tradition of nuclear medicine continues today, largely uninterrupted for more than 50 years. Until recently, though, life sciences research has been a secondary force at the Lawrence Berkeley Laboratory (LBL). Today, a true multi-program laboratory has emerged, in which the life sciences participate as a full partner. The LBL Human Genome Center is a contribution to the growing international effort to map the human genome. Its achievements represent LBL divisions, including Engineering, Materials and Chemical Sciences, and Information and Computing Sciences, along with Cell and Molecular Biology and Chemical Biodynamics. The Advanced Light Source Life Sciences Center will comprise not only beamlines and experimental end stations, but also supporting laboratories and office space for scientists from across the US. This effort reflects a confluence of scientific disciplines — this time represented by individuals from the life sciences divisions and by engineers and physicists associated with the Advanced Light Source project. And finally, this report itself, the first summarizing the efforts of all four life sciences divisions, suggests a new spirit of cooperation. 30 figs.

22756 (LBL–28042) **Biological soft x-ray contact microscopy: Imaging living CHO-SC1 cells and other biological materials.** Guttmann, G.D. Lawrence Berkeley Lab., CA (USA). Aug 1989. 223p. Sponsored by U.S. Department of Defense; U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Contract F49620-87-K-0001. Order Number DE90007560. Available from NTIS, PC A11/MF A01 - OSTI; GPO Dep.

This dissertation is a description of soft x-ray contact microscopy and the successful efforts to expand this technique to image at high resolution, living mammalian cells. Soft x-ray contact microscopy (SXCM) is a form of x-ray lithography, however, the biological cell is imaged instead of an electron-cut microcircuit mask. The contrast mechanism is based upon the x-ray absorption lengths of carbon and nitrogen. The soft x-rays were generated by a conventional laboratory source or a laser-induced plasma x-ray source. The conventional laboratory soft x-ray source, was a converted electron evaporator. The target materials were vanadium, and carbon. The laser-induced plasma x-ray source was the Lawrence Livermore National Laboratory (LLNL) JANUS laser facility. The target material was tantalum. A radiachromic nylon film was used to calibrate the exposure dose. The imaging detector was an x-ray sensitive resist or a copolymer. A wet cell chamber (WCC) was designed to keep a biological sample alive at atmospheric pressure yet permit imaging by soft x-rays. The limits of resolution required an understanding of the interaction of soft x-rays with matter, Fresnel diffraction, penumbral blurring and secondary electron travel within a resist. The imaging of the biological samples included sample preparation, resist development and electron microscope readout of the resist. The biological samples were fixed erythrocytes and zymogen granules, and critical point dried 9L glialsarcoma cells. The major result of this work was the first pictures of living mammalian cells, CHO-SC1, by SXCM. The LLNL JANUS laser facility was the x-ray source for the living cell x-ray micrographs. 155 refs., 69 figs.

22757 (MBL–1989-3) **Detection of DNA damage in cells exposed to ionizing radiation by use of antisingle-stranded-DNA monoclonal antibody.** Schans, G.P. van der (Rijksverdedigingsorganisatie TNO, Rijswijk (Netherlands). Medisch Biologisch Lab. TNO); Loon, A.A.W.M. van; Groenendijk, R.H.; Baan, R.A. TNO-Rijksuniversiteit Leiden Collaboration. Rijksverdedigingsorganisatie TNO, Rijswijk (Netherlands). Medisch Biologisch Lab. TNO. Mar 1989. 26p. Contract A83/K/70(HDO Assignment No.). Order Number DE90619498. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Inlcudes summary, motivation and explanatory note in Dutch.

An immunochemical method has been developed for quantitative detection of DNA damage in mammalian cells. The method is based on the binding of a monoclonal antibody to single-stranded DNA. The clone producing this antibody, D1B, was obtained as a by-product from fusion of mouse myeloma cells with spleen cells isolated from a mouse immunized with chemically modified DNA. The technique is based upon the determination of the percentage single-strandedness resulting from the partial unwinding of cellular DNA under alkaline conditions, a time-dependent process. Single-strand and double-strand DNA breaks, or lesions converted into such breaks in alkaline medium, form initiation points for the unwinding. The extent of unwinding under controlled conditions is a measure, therefore, of the amount of such sites. The method is rapid, does not require radioactive labelling of DNA or physical separation of single- from double-stranded molecules, is sufficiently sensitive to detect damage induced by 1 Gu of ionizing radiation and needs only small amounts of cells. The usefulness of the technique was demonstrated in a study on the induction of damage and its repair in unlabelled cultured Chinese hamster cells and in DNA-containing cells of human blood, both after exposure to ^{60}Co-γ-rays, and in white blood cells and bone marrow cells of X-irradiated mice. A dose-related degree of unwinding was observed and repair could be observed up to 60 min after irradiation. (author). 19 refs.; 3 figs.; 1 tab.

22758 (MBL–1989-5-A83/K/70) **Biological dosimetry of radiation damage.** Schans, G.P. van der; Lon, A.A.W.M. van; Baan, R.A. Dutch Ministery of Defense-TNO/MBL Collaboration. Rijksverdedigingsorganisatie TNO, Rijswijk (Netherlands). Medisch Biologisch Lab. TNO. 17 Nov 1989. 46p. Available from Library KNAW; P.O.Box 41950, 1009 DD Amsterdam, Netherlands. Available from Library KNAW; P.O.Box 41950, 1009 DD Amsterdam, Netherlands.

Includes summary in Dutch.

Immunochemical methods have been developed for the quantitative detection of radiation-damage in DNA in mammalian cells. One of these methods is based on the binding of monoclonal antibodies to single-stranded DNA. This single-stranded DNA is generated by unwinding due to radiation damage in DNA and the amplification of the unwinding by a subsequent alkali-treatment. The lower detection limit is about 0.5 Gy, directly after irradiation. After further development of the method the amount of damage can be assessed within 2 h after sampling. Furthermore, the method is expected to be applicable at the single-cell level which will open the possibility to distinguish between partial and total body irradiation. The development of this method has been described in MBL-report 1989-3. In this report the exploratory investigations performed in the initial stages of this project are described. 14 refs.; 13 figs.; 3 tabs.

22759 (NVS–10) **Emergency reception of accidents and incidents in working with ionizing radiation.** Abrahamse, J.C.; Gispen, J.G.W. Nederlandse Vereniging voor Stralingshygiene, Eindhoven (Netherlands). 1989. 24p. (In Dutch). Order Number DE90706053. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

This manual is intended to be a general manual for the responsible expert regarding radiation hygienics in order to assist him in establishing an organization for combat of accidents and incidents. First attention is paid considerations underlying emergency measures and aid, subsequently the demands and desirabilities in the practical organization are discussed. 3 figs.

22760 (ORNL–6590) **Activation of cobalt by neutrons from the Hiroshima bomb.** Kerr, G.D. (Oak Ridge National Lab., TN (USA)); Dyer, F.F.; Emery, J.F.; Pace, J.V. III; Brodzinski, R.L.; Marcum, J. Oak Ridge National Lab., TN (USA). Feb 1990. 83p. Sponsored by U.S. Department of Defense. DOE Contract AC05-84OR21400. Order Number DE90008018. Available from NTIS, PC A05/MF A01; OSTI; INIS; GPO Dep.

A study has been completed of cobalt activation in samples from two new locations in Hiroshima. The samples consisted of a piece of steel from a bridge located at a distance of about 1300 m from

the hypocenter and pieces of both steel and concrete from a building located at approximately 700 m. The concrete was analyzed to obtain information needed to calculate the cobalt activation in the two steel samples. Close agreement was found between calculated and measured values for cobalt activation of the steel sample from the building at 700 m. It was found, however, that the measured values for the bridge sample at 1300 m were approximately twice the calculated values. Thus, the new results confirm the existence of a systematic error in the transport calculations for neutrons from the Hiroshima bomb. 52 refs., 32 figs., 16 tabs.

22761 (PB–90-130626/XAB) **NIOSH (National Institute for Occupational Safety and Health) testimony on radiation before the Senate Committee on Commerce, Science, and Transportation, by Elliot Harris, June 28, 1977.** National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). 28 Jun 1977. 12p. Available from NTIS, PC A03/MF A01.

The statement concerned National Institute for Occupational Safety and Health (NIOSH) research programs relating to occupational exposure to radiation. Much epidemiological data points to exposure to radon daughters as hazards to uranium miners and milling operators. Problems also arise from the operation of radiation-generating equipment. Nonionizing radiation hazards included visible, ultraviolet, radiofrequency and microwave radiation, infrared and ultrasonic radiation. Ultraviolet radiation can cause sunburn, eye damage, depigmentation, precancerous tumors, basal and squamous cell cancers, and malignant melanomas. Infrared radiation has been implicated in the development of cataracts. Laser radiation was linked with burns and fire hazards. The only hazard associated with visible radiation thus far has been eyestrain due to the lack of sufficient light while performing a given task. Optical radiation exposures occurred among workers using cathode ray tubes, such as computer screens, in their jobs. Workers were exposed to many sources of microwave and radiofrequency radiation from radio and radar transmitters, industrial drying equipment, heat sealing and curing equipment, and certain medical research devices. Training and support services were mentioned.

22762 (PNL–6100-Pt.4, pp. 22-23) **Bethe-born theory of ionization by high-velocity ions and electrons.** Miller, J.H.; Wilson, W.E. Pacific Northwest Lab., Richland, WA (USA). Feb 1987. In *Pacific Northwest Laboratory: Annual report for 1986 to the DOE Office of Energy Research: Part 4, Physical sciences.* Order Number DE87010025. Available from NTIS, PC A04/MF A01.

A comprehensive and accurate data base of collision cross sections is required for a detailed description of the absorption of ionizing radiation in biologically significant materials. Two contributions on the application of Beth's asymptotic expansion theory to the analysis of differential ionization cross sections were made this year. The first of these involves the energy spectrum of secondary electrons that are ejected from water by fast bare ions and electrons. Our second contribution in this area concerns the spectrum of secondary electrons produced when structured ions collide with atomic and molecular targets. As was the case for bare ions, models of ionization by structured ions rely on the separation of target and projectile properties afforded by the first Born approximation to the quantum collision theory. The Compton profile of the projectile gives the contribution to the momentum of electrons moving with the projectile from their motion about the nucleus of the projectile. Given the total momentum of these electrons, stripping can be viewed as electron scattering by the target. The dominant contribution to the differential stripping cross section is provided by elastic scattering, but inelastic scattering may also occur; this phenomenon contributes to the cross section for simultaneous projectile stripping and target ionization. The dominant role of bound electrons on the projectile in target ionization is screening of the projectile's nuclear charge.

22763 (PNL–6100-Pt.4, pp. 33-35) **A comparison of microscopic dose with average dose near high-energy iron ions.** Metting, N.F.; Braby, L.A. Pacific Northwest Lab., Richland, WA (USA). Feb 1987. In *Pacific Northwest Laboratory: Annual report for 1986 to the DOE Office of Energy Research: Part 4, Physical sciences.* Order Number DE87010025. Available from NTIS, PC A04/MF A01.

The primary goal underlying the Radiation Dosimetry task is to understand the connections between the physical events produced by the interaction of ionizing radiation with matter and their biological consequences. Biophysical studies indicate that the mechanisms responsible for radiation effects in biological systems involve injury to cell substructures much smaller than a cell nucleus. To understand the molecular mechanisms responsible, it is important to know the probable amount of dose deposited in the microscopic volumes of interest for a particular biological and point. This probability depends on the type of radiation, and is expected to correlate with the biological effects observed. At the Bevalac accelerator at Lawrence Berkeley Laboratory, a small proportional counter (PC) mounted in the large vacuum chamber was used to measure single-event energy deposition distributions as a function of the distance radially outward from the primary ion path, for a 1.3-μm-diameter site. In the case of heavy ion passage through tissue, the local pattern of energy deposition in critical volumes is strongly influenced by the frequency and range of secondary electrons. One homogeneous track structure model predicts a quantity called an energy density or local dose, which is a function of the radial distance. If the velocity of the ion is varied each new delta-ray energy distribution would be predictable, but the deposition of energy in matter is a complex function of that distribution. One cannot extrapolate precisely to determine spectra for other velocities using only the measurements taken at one velocity. The best that can be done short of a Monte Carlo simulation (or direct measurement) is estimation track structure model.

22764 (PNL–6100-Pt.4, pp. 46-47) **Kinetics of C3H 10T1/2 mouse cells.** Metting, N.F.; Mortenson, E.; Braby, L.A.; Nelson, J.M. Pacific Northwest Lab., Richland, WA (USA). Feb 1987. In *Pacific Northwest Laboratory: Annual report for 1986 to the DOE Office of Energy Research: Part 4, Physical sciences.* Order Number DE87010025. Available from NTIS, PC A04/MF A01.

The 10T1/2 cell line has been brought to PNL because of its usefulness as an in vitro biological system for transformation assay, and because a fast repair process in response to irradiation has been observed in these cells. Before using the cells in radiobiological studies, it was important to observe the growth kinetics of our cultures and verify their similarity to those reported by other laboratories in which they are used, so that our subsequent measurements could be compared with and added to the body of scientific work already compiled. To become familiar with the cell morphology and cloning characteristics, we conducted an experiment in which a number of flasks were seeded with about 350 cells each. Each day, starting with the second day after plating, a flask was stained and the number of clones plus the number of cells in each clone were counted. There are several types of cell morphologies within the population. Flow cytometry (FCM) studies were used to assess cell cycle characteristics, Again, a number of flasks were seeded, but this time with a large number of exponentially growing cells. Measurements indicated that the cultures were probably more or less synchronized at their initiation by plating efficiency effects, that they maintained a loose synchrony by phases through about the eighth day and that before at least the eleventh day they began to pile up in G1 phase.

22765 (VR–89-05) **Reports from the RIVM 1988.** Ministerie WVC-RIVM collaboration. Rijksinstituut voor Volksgezondheid en Milieuhygiene, Bilthoven (Netherlands). 1988. 344p. (In Dutch). Order Number DE90619461. Available from NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

In this report the progress and developments of the departments within the headsectors; Microbiology and Immunology, Pharmacology and Toxicology, Chemistry and Physics, of the Dutch National Institute for Environment Hygiene and Public Health (RIVM) over the year 1988, and a collection of separate research papers are presented. Three of these are in INIS scope, one dealing with calibration of plan-parallel ionization chambers used in radiotherapy, one treating some aspects of the action mechanism of gamma- and UV-radiation at cellular level, and an account of the Dutch Coordination-Committee for Measurements of Radioactivity and Xenobiotic (CCRX). (H.W.). refs.; figs.; tabs.

22766 (VR–89-05, pp. 320-323) **Fundamental aspects of the mechanisms of gamma-radiation and ultraviolet-radiation.**

Leenhouts, H.P.; Chadwick, K.H.; Wijngaard, E.; Sijsma, M.J. Ministerie WVC-RIVM collaboration. Rijksinstituut voor Volksgezondheid en Milieuhygiene, Bilthoven (Netherlands). 1988. (In Dutch). In *Reports from the RIVM 1988.* Order Number DE90619461. Available from NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

Some aspects of the mechanism of action at a cellular level of gamma- and UV-radiation and their possible consequences upon radiation hazards, are discussed. (author). 5 refs.; 5 figs.; 1 tab.

22767 (DOE/EA–0407) **Liquefied Gaseous Fuels Spill Test Facility program: Eleven additional chemicals: Environmental Assessment.** USDOE Assistant Secretary for Fossil Energy, Washington, DC (USA). Dec 1989. 140p. Sponsored by U.S. DOE Fossil Energy. Order Number DE90008109. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

An Environmental Assessment (EA) has been prepared to assess the environmental consequences of spill testing eleven hazardous materials at the Liquefied Gaseous Fuels Spill Test Facility (LGF-STF) at Frenchman Flat, Nevada Test Site (NTS). These chemicals are: chlorosulfonic acid, fluorosulfonic acid, hydrogen chloride, methyl trichlorosilane, nitrogen tetroxide, oleum, silicon tetrachloride, sulfur-trioxide, titanium tetrachloride, trichlorosilane, and unsymmetrical dimethyl hydrazine. DOE has determined that the proposed spill testing of these eleven hazardous materials at LGF-STF at Frenchman Flat is not a major federal action significantly affecting the quality of the human environment within the meaning of the National Environmental Policy Act (NEPA). Therefore, an environmental impact statement (EIS) will not be prepared.

22768 (DOE/ER–0439) **Summary results of an assessment of research projects in the Chemical Toxicology Research Program.** USDOE Office of Energy Research, Washington, DC (USA). Office of Program Analysis. Feb 1990. 6p. Sponsored by U.S. DOE Energy Research. Order Number DE90008118. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Chemical Toxicology Research Program of the Department of Energy (DOE) sponsors fundamental and applied research to understand the interactions with living systems of chemicals associated with energy activities. A companion effort investigates the effects of radiation on biological systems. The Office of Program Analysis (OPA) undertook an assessment of the quality of projects in the DOE Chemical Toxicology Research Program. The purpose of this assessment was to obtain sufficient information for Office of Health and Environmental Research managers to determine overall quality of research in the Chemical Toxicology Research Program, overall quality of research within subprograms of the Chemical Toxicology Research Program, quality of individual research projects within the Chemical Toxicology Research Program, and priority research targets and opportunities for future sponsorship by the Chemical Toxicology Research Program. 1 fig.

22769 (Juel-Spez–503) **Search for indicatory criteria to predict effects of chemical induced stress on ecosystemal level. Vol. 12. Final reports of sponsored projects. Pt. 2.** Scheele, B.; Verfondern, M. (comps.). Kernforschungsanlage Juelich GmbH (Germany, F.R.). Projektleitung Biologie, Oekologie, Energie (PBE). Jun 1989. 560p. (In German). Order Number DE90759497. Available from NTIS (US Sales Only), PC A24/MF A01; OSIT; INIS.

This is the second and last part of reports on results of a research program titled 'Search for Indicatory Criteria to Predict Effects of Chemical Induced Stress on Ecosystemal Level'. These studies have been supported by the German Ministry of Research and Technology since 1980/81. They deal with structural and in some cases as well with functional reactions of terrestrial ecosystems on chemical stress. On the basis of this knowledge, indicatory criteria for the ecosystem itself as well as chemical damage are developed and their efficiency is discussed. The report contains the following 3 final reports: Studies of the effects of chemicals on forest ecosystems and their regenerative ability by means of parasitoids as bioindicators; Development of indicators for the effects of chemical pollutants on meadowland ecosystems; Residue analyses of environmental pollutants in compartments of terrestrial ecosystems. As a supplement to the 2nd report a short report is added with the title: Residue analyses of environmental pollutants in compartments of terrestrial ecosystems. Separate abstracts were prepared for 3 of the reports of this volume. (orig./MG).

22770 (Juel-Spez–503 A1-A166) **Studies of the effects of chemicals on forest ecosystems and their regenerative ability by means of parasitoids as bioindicators.** Albert, A.M. (Forstliche Versuchs- und Forschungsanstalt Baden-Wuerttemberg, Freiburg im Breisgau (Germany, F.R.). Abt. Waldschutz). Kernforschungsanlage Juelich GmbH (Germany, F.R.). Projektleitung Biologie, Oekologie, Energie (PBE). Jun 1989. (In German). In *Search for indicatory criteria to predict effects of chemical induced stress on ecosystemal level. Vol. 12. Final reports of sponsored projects. Pt. 2.* Order Number DE90759497. Available from NTIS (US Sales Only), PC A24/MF A01; OSTI; INIS.

The effect of a chemical application on the epigeic fauna, especially parasitic Hymenoptera, of an oak-hornbeam-forest was studied by means of ground photoelectors. In a large area project two out of three study plots of 1 ha size each received a single treatment with cypermethrin resp. propoxur. In other experiments with small ground photoelectors only small areas were treated with several chemicals. The following parameters, on the basis of animal groups (orders, families) or species, are suitable bioindicators for chemical stress in ecosystems: 1. alternations in numbers of caught animals, 2. alterations in dominance identity between experimental and control plot and between different years on the same plot, 3. alterations in height and direction of fluctuations, especially variance of the fluctuation coefficients. To a lesser degree, also changes in trophic structure can be used. (orig./MG).

22771 (Juel-Spez–503 B-B195) **Definition of indicators for the effects of chemical pollutants on meadowland ecosystems.** Runge, M.; Schaefer, M.; Werner, W.; Conrady, D.; Neemann, G.; Stickan, W. Kernforschungsanlage Juelich GmbH (Germany, F.R.). Projektleitung Biologie, Oekologie, Energie (PBE). Jun 1989. (In German). Contract BMFT 0373259. In *Search for indicatory criteria to predict effects of chemical induced stress on ecosystemal level. Vol. 12. Final reports of sponsored projects. Pt. 2.* Order Number DE90759497. Available from NTIS (US Sales Only), PC A24/MF A01.

A pasture of white clover (Lolio-Cynosuretum) and one of golden oat grass (Poo-Trisetetum flavescentis Festuca-rubra facies) were analyzed for their sensitivity and the regeneration capacities of their different species after exposure to environmental pollutants (pentachlorophenol and 2,4-dichlorophenoxyacetic acid). The investigations were to describe the reaction of the phytocoenosis and zoocoenosis on the basis of changes within species or groups of species (e.g. the totality of plant stack as an indicator), to investigate ecosystem structures or processes for their applicability as indicators (e.g. primary production, litter decomposition rate), to compare the effects of a single, high-level exposure with those of repeated low-level exposure, and to test the specific sensitivity of individual animal and plant species. The results are presented and discussed. (orig./MG).

22772 (PB–90-130527/XAB) **Report on cancer risks associated with the ingestion of asbestos.** Lemen, R.; Meinhardt, T.; Becking, G.; Cantor, K.; Cherner, J. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Jan 1986. 51p. Available from NTIS, PC A04/MF A01.

Cancer risks associated with ingestion of asbestos are discussed. Asbestos contamination of drinking water is considered. At least 66.5% of the United States water systems are capable of eroding asbestos cement pipes. The ability of water to leach asbestos from asbestos cement pipes can be modified by coatings applied to the inside pipe surface. Asbestos contamination in foods or pharmaceuticals is discussed. Asbestos fibers at concentrations of 1.1 to 172.7 million fibers per liter have been found in beverages. To date, studies supported by the Food and Drug Administration (FDA) have provided no evidence that ingesting asbestos results in

an increased cancer risk. The FDA has determined that no prohibition on using asbestos filters in processing food, beverages, and non-parenteral drugs is needed. Toxicological studies on asbestos ingestion and carcinogenicity are reviewed. Epidemiological evaluations of the association between drinking-water supplies containing asbestos and cancer mortality are discussed. It is concluded that the available information is insufficient for assessing the risk of cancer associated with ingesting asbestos.

22773 (PB–90-131582/XAB) **Registry of Toxic Effects of Chemical Substances (RTECS), 1988 edition. User's guide to the RETECS computer tape.** Sweet, D.V. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Oct 1989. 94p. Available from NTIS, PC A05/MF A01.

Supersedes PB–87-222246. For system on magnetic tape, see PB–89-900300. For system on diskette, see PB–89-121487.

The User's Guide describes the tape characteristics and the file layout of the Registry of Toxic Effects of Chemical Substances (RTECS) as it appears on the RTECS computer tape. It also includes the Introduction to the RTECS and the Detailed File Description of the RTECS, as well as tables, figures, and appendices.

22774 (PB–90-855982/XAB) **Toxicity of mercury and mercury compounds. May 1978-August 1989 (Citations from Pollution Abstracts). Report for May 1978-August 1989.** National Technical Information Service, Springfield, VA (USA). Jan 1990. 94p. Available from NTISPC N01/MF N01.

This bibliography contains citations concerning the toxic effects of mercury and mercury compounds on biological systems. Mercury halides, organic mercury compounds, mercury metal, mercury vapors, and other compounds are discussed. Metabolism, toxicology, occupational exposure, symptoms of exposure, mechanisms of interaction with biological systems, demographics of mercury accumulation and poisoning, and case reports are considered. Heavy-metal pollution and bioaccumulation are referenced in related published bibliographies. (Contains 204 citations fully indexed and including a title list.)

22775 (PB–90-856071/XAB) **Benzene toxicity. March 1978-July 1989 (Citations from the Life Sciences Collection data base). Report for March 1978-July 1989.** National Technical Information Service, Springfield, VA (USA). Jan 1990. 140p. Available from NTISPC N01/MF N01.

Supersedes PB–88-866371.

This bibliography contains citations concerning toxicity of benzene following short- and long-term exposure. The metabolism, carcinogenicity, and teratogenic potential of benzene are considered. Methodology to quantitate its presence in the atmosphere, body tissues, and body fluids are discussed. Occupational hazards of benzene are included. (This updated bibliography contains 327 citations, 33 of which are new entries to the previous edition.)

22776 (PNL–6100-Pt.4, pp. 1-4) **Determination of adducts of benzo[a]pyrene to deoxyribonucleic acid using gas chromatography/mass spectrometry techniques.** Chess, E.K.; Thomas, B.L.; Springer, D.L.; Mann, D.B.; Hendren, D.J.; Bean, R.M. Pacific Northwest Lab., Richland, WA (USA). Feb 1987. In *Pacific Northwest Laboratory: Annual report for 1986 to the DOE Office of Energy Research: Part 4, Physical sciences.* Order Number DE87010025. Available from NTIS, PC A04/MF A01.

Adducts to deoxyribonucleic acid (DNA), formed from metabolites of polynuclear aromatic compounds, are relatively persistent and correlate with bioresponse (carcinogenicity). Therefore, qualitative and quantitative analyses of adducts in the DNA of individuals may provide valuable information on recent exposure to carcinogenic hydrocarbons. The basic thrust of the analytical development at PNL is to isolate the DNA, liberate the adducted hydrocarbon residue from the DNA with acid hydrolysis, and prepare derivatives of the hydrolyzed species that will enhance its detection, quantitation, and characterization using gas chromatography/mass spectrometry (GC/MS). We have initiated the development of the necessary techniques using benzo[a]pyrene (BaP) and its metabolites. Samples of DNA adducts of radiolabeled BaP have been prepared for study by reacting DNA isolated from calf thymus with benzo[a]pyrene-7,8-diol-9,10-epoxide (the ultimate carcinogenic form of BaP). The identity of the synthesized adduct was confirmed by mass spectrometry. Initial experiments determined that the derivatized metabolites could be detected during single-ion monitoring (SIM) GC/MS analyses using a mass selective detector. These levels of sensitivity are sufficient to detect the amounts of DNA-bound metabolites isolated from laboratory animals exposed to relatively high levels of carcinogens, and may be sufficient to detect the hydrolyzed metabolites at levels that can be isolated from environmentally exposed systems. Results from the initial methodology development stages of this assay indicate to use that GC/MS analysis using SIM can provide the specificity and sensitivity required for the quantitative determination of derivatized PAH metabolites isolated from DNA adducts that have been formed as a result of environmental exposure to PAH.

22777 (PNL–6100-Pt.4, pp. 4-5) **Disappearance of benzo[a]pyrene and other polycyclic aromatic hydrocarbons from mouse skin in vivo.** Wright, C.W.; Dankovic, D.A. Pacific Northwest Lab., Richland, WA (USA). Feb 1987. In *Pacific Northwest Laboratory: Annual report for 1986 to the DOE Office of Energy Research: Part 4, Physical sciences.* Order Number DE87010025. Available from NTIS, PC A04/MF A01.

Previous experimental data showed that increased skin tumor initiation activity of complex coal-derived mixtures was correlated with products of higher boiling-point ranges and that the neutral PAH fraction of these complex mixtures was the most active fraction, using skin tumor initiation as a biological endpoint. When added to benzo[a]pyrene (BaP), however, the high-boiling coal-derived mixtures have suppressed the skin tumorigenicity of the carcinogenic parent compound, indicating that the tumorigenic coal-derived mixtures are not additive with BaP carcinogenicity, but appear to be inhibitory. In the present work, the effects of the PAH fraction isolated from a high-boiling coal-derived complex mixture of the rate of disappearance of BaP from mouse skin in vivo were examined. The rate of disappearance from mouse skin was used as an indirect measure of the rate of BaP uptake and metabolic activation by the mixed function oxidase (MFO) system of mouse skin. In addition, the individual rates of disappearance from mouse skin of 12 PAH compounds in the PAH fraction were determined from quantitative high-resolution gas chromatographic analysis of hexane extracts. The components quantified in the extracts were identified by retention time and mass spectral information. Coal-derived complex mixtures have been noted to yield decreased tumorigenic potency when increased concentrations of highly alkylated species were present. The skin half-life of the 25-μg dose of BaP applied alone was significantly shorter than the skin half-life of a nearly comparable dose applied with the complex PAH fraction isolated from the coal liquid. The apparent inhibition of skin metabolism may be related to the observed inhibition of skin tumor initiating activity of BaP and the observed inhibition of BaP binding in skin when in the presence of complex coal-derived liquids.

22778 (AD-A–214805/4/XAB) **Effect of exposure to microwaves on the neuroendocrine status of the rat. Final report, 1 January 1979-30 June 1980.** Stith, R.D. Oklahoma Univ., Oklahoma City, OK (USA). Health Sciences Center. 31 Aug 1980. 17p. Available from NTIS, PC A03/MF A01.

Male Sprague-Dawley rats were restrained individually in a polyethylene box and placed in the far field of 1.2 CH_3, parallel to the electric field. Rats were irradiated for 30 minutes with either no power, continuous wave, or pulsed wave radiation of 5 or 15 mW/cm^2, average density. Groups of rats were also employed which had been subjected to stress or external heating in place of microwave radiation. At the end of the exposure period, rats were sacrificed by guillotine and hypothalamus, brain stem, and blood samples obtained. Tissues were quick-frozen and stored at -20 C until analyses. Brain tissues were assayed for tyrosine hydroxylase activity (TH) and norepinephrine (NE) and dopamine (DA) concentrations. Results reveal that hypothalamic TH and DA, but not NE were depressed after exposure to microwaves. Brainstem TH and DA were also depressed, but not to as great a degree as in hypothalamus, and mainly to 15 mW/cm2 (CW or PW) rather than 5

mW/cm2. Brainstem NE was unaffected. These data reveal that effects of acute microwave exposure on the brain can be detected. The changes observed were apparently not due to elevated adrenal corticoid levels from the to heating of the animals. Further investigation is suggested to clarify this phenomenon and its relationship to the physiology of the organism.

22779 (AD-A–214878/1/XAB) **Cumulative airport noise-exposure metrics: An assessment of evidence for time-of-day weightings. Revision.** Fields, J.M. Southwest Research Inst., San Antonio, TX (USA). Nov 1989. 180p. Available from NTIS, PC A09/MF A01.

Revision of report dated Nov 86, AD-A174-848.

The differential impact of noise on residents at different times of day is examined in analyses of the original machine-readable data from ten community surveys and in detailed reviews of the published results from 20 additional surveys. Analyses are conducted using alternative community response measures and analysis techniques. The primary objective of these analyses is to determine the relative impact of noise during the daytime and nighttime by estimating the value of a time-day weighting in the adjusted energy model. Some support is found for nighttime and evening weightings, however, the estimates of these time-of-day weightings are found to be highly accurate. Examinations of the factors affecting this accuracy lead to the conclusion that studies of community response to noise will not provide a usefully accurate estimation of the time-of-day weighting parameter in the adjusted energy model. This report provides data on proportions of the United States population engaged in noise-sensitive activities at different times of day. The report reproduces all social survey results in which averages of nighttime response are plotted by nighttime noise levels. Analyses are conducted of the relationship between daytime and nighttime noise environments around United States airports.

57 HEALTH AND SAFETY

22780 (AECB/ACNS–INF00299(E)) **Alternative electical energy systems: A comparison of the risks of occupational and public fatalities: Executive summary.** Atomic Energy Control Board, Ottawa, ON (Canada). Advisory Committee on Nuclear Safety. Mar 1989. 97p. (MICROLOG–90-01129). Available from PC Canada. Atomic Energy Control Board, 270 Albert St., P.O. Box 1046, Ottawa, ON, CAN K1P 5S9; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1. Prices: PC PRICES UPON REQUEST; MF $10 CAN.

The occupational and public health risks of different electrical energy production systems have been the subject of many studies in recent years. This report concentrates on the comparative risks of large coal, nuclear and hydraulic plants. Brief summaries of risk estimates for oil- and gas-fired electric power plants are appended. The report deals mainly with the risks of fatalities, whether by accident or disease, arising from normal operation but includes a discussion of the risks of catastrophic accidents. A literature search was conducted for objective critical evaluations or recent risk studies of electrical energy systems. A risk assessment method designed by Niehaus and Paskievici was used. The report first describes and summarizes international data, then describes risk estimates for the Canadian situation. It is concluded that the occupational risks of the coal fuel cycle are about 2-4 times higher than those from the nuclear or hydraulic systems, and that the public risks from the coal-fired system are also somewhat greater than those from the nuclear or hydraulic systems.

22781 (HAZ–CE02854) **Haztech Canada '88: Dangerous goods and hazardous waste management conference proceedings.** Haztech Canada, Edmonton, AB (Canada). 1988. 382p. (CONF-8805352–: Haztech Canada '88: dangerous goods and hazardous waste management conference, Mississauga (Canada), 10-12 May 1988; CE–02854). Available from Haztech Canada, 4936-87th St., no. 26, Edmonton, AB, CAN T6E 5W3. Prices: $50.00 CAN.

This conferences was called to provide a forum for dicussion of the management of hazardous materials, both chemical and biological. The topics covered are: pollution abatement at the source and during the transport, protection and decontamination of the environment (especially soils and aquifers), decommissioning of industrial installations, chemical monitoring of wastes and contaminated media, fire and accident prevention, regulations and economics. Separate abstracts have been prepared for 4 papers from this conference.

22782 (OH/RD–88-56-K) **Comments on the analysis of occupational exposure to PCBs and various cancers by the Industrial disease standard panel.** Camacho, F. Ontario Hydro Research Div., Toronto, ON (Canada). 21 Mar 1988. 5p. (MICROLOG–89-02586). Available from PC Ontario Hydro Research Division, Records Clerk, Bldg. KR 107, 800 Kipling Ave., Etobicoke, ON, CAN M8Z 5S4; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1. Prices: PC $10.00 CAN; MF $10 CAN.

The analysis presented in the Report to the Worker's Compensation Board on Occupational Exposure to polychlorinated biphenyls (PCBs) during the manufacture of electrical capacitors and occurrence of various. cancers is reviewed. It is concluded that important objections can be raised to some of the arguments in the Report. These objections may be summarized as follows: the available evidence does not support the finding of the Report that compelling epidemiological evidence of excess cancers appears for the liver, biliary tract and gall bladder cancers. The reviewed evidence does not support the existence of a significant link between these cancer incidences and the exposure to PCBs. While such a connection is possible, more information is needed to establish the significance of the link. 8 refs.

22783 (ORNL/TM–11421) **Environmental protection for hazardous materials incidents.** Barkenbus, B.D.; Carter, R.J.; Dobson, J.E.; Easterly, C.E.; Ogle, P.S.; VanCleave, A.K. Oak Ridge National Lab., TN (USA). Feb 1990. 602p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract AC05-84OR21400. Order Number DE90008070. Available from NTIS, PC A25/MF A01 - OSTI.

This document was prepared to provide the US Air Force fire protection community with an integrated program for handling hazardous materials (HAZMAT)s and hazardous material incidents. The goal of the project was to define and identify a computer system for the base fire departments that would facilitate hazard assessment and response during HAZMAT emergencies, provide HAZMAT incident management guidelines, and provide a training tool to simulate emergency response during normal times. Site visits to Air Force bases were made to observe existing HAZMAT related organizations, their methods and procedures used in HAZMAT management, and to collect personnel input for the development of the computerized Hazardous Materials Incident Management System (HMIMS). The study concentrated on defining strategic areas of concern to emergency response personnel. Particular emphasis was given to such areas as responsibilities and roles for response agencies; personnel requirements to handle HAZMAT incidents; procedures to follow during HAZMAT incidents and decontamination; personnel evacuation; postincident evaluation and feedback; emergency response personnel participation in installation restoration program; personal protective clothing; mutual air requirements; and training. Future recommendations were made for purchase, use, storage, disposal, and management of HAZMATs during their life cycle on bases and during incidents. This detailed technical report and the HMIMS are expected to meet the integrated HAZMAT program needs primarily of Air Force fire departments and secondarily in other response agencies. 21 figs., 6 tabs.

22784 (BNL–43503) **Shelf Edge Exchange Processes-2: SEEP2-01, R/V ENDEAVOR cruise 172: Hydrographic data report.** Behrens, W.J.; Wilson, C.; Flagg, C.N.; Wallace, D.W.R.;

Wilke, R.J.; Wyman, K.D. Brookhaven National Lab., Upton, NY (USA). Nov 1989. 235p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. Order Number DE90008288. Available from NTIS, PC A11/MF A01 - OSTI; GPO Dep.

The R/V ENDEAVOR cruise 172, SEEP2-01, took place from 5–20 February, 1988 and deployed ten moorings along two cross-shelf lines (referred to as the North and South lines) across the outer continental shelf. Acoustic Doppler current profilers (ADCP) were deployed in conjunction with four of the moorings. During this cruise 47 CTD casts were made measuring pressure, temperature, conductivity, dissolved oxygen, fluorescence and light transmission. Discrete samples were taken in rosette-mounted Niskin bottles and analyzed for concentration of nutrients, chlorophyll a, dissolved oxygen, and particulate organic carbon and nitrogen.

22785 (BNL–43504) **Shelf Edge Exchange Processes-2: Seep2-02, R/V CAPE HATTERAS cruise CH01-88: Hydrographic data report.** Wilson, C.; Behrens, W.J.; Flagg, C.N.; Wallace, D.W.R.; Wilke, R.J.; Wyman, K.D. Brookhaven National Lab., Upton, NY (USA). Nov 1989. 340p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. Order Number DE90008505. Available from NTIS, PC A15/MF A01 - OSTI; GPO Dep.

The R/V CAPE HATTERAS cruise CH01-88, SEEP2-02, took place from 3–20 March, 1988 and focused primarily on biological processes in the SEEP2 area. A short term sediment trap mooring was deployed near mooring 1 and recovered during the cruise. The mooring consisted of two 0.07 sq. meter and one 0.7 sq. meter sediment traps. Two time series, approximately 48 hours each, were conducted in the area of the sediment trap mooring. The time series were designed to study primary and secondary productivity and involved sampling nutrients, dissolved oxygen, chlorophyll, zooplankton abundance and distribution, and zooplankton fecal pellet distribution. Experiments to estimate grazing rates and fecal pellet production of the dominant copepods were also done. Sediment trap and zooplankton data are not reported here. During this cruise 99 CTD casts were made measuring pressure, temperature, conductivity, dissolved oxygen, fluorescence and light transmission. Discrete samples were taken in rosette-mounted Niskin bottles and analyzed for concentration of nutrients, chlorophyll a, dissolved oxygen, and particulate organic carbon and nitrogen.

22786 (BNL–43641) **Shelf Edge Exchange Processes-2: SEEP2-03, R/V ENDEAVOR cruise 178: Hydrographic data report.** Behrens, W.J.; Wilson, C.; Flagg, C.N.; Wallace, D.W.R.; Wilke, R.J.; Wyman, K.D. Brookhaven National Lab., Upton, NY (USA). Nov 1989. 212p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. Order Number DE90008290. Available from NTIS, PC A10/MF A01 - OSTI; GPO Dep.

The R/V ENDEAVOR cruise 178, SEEP2-03, took place from 8–13 June, 1988 and recovered ten moorings along two cross-shelf lines (referred to as the North and South lines) across the outer continental shelf. During this cruise 35 CTD casts were made measuring pressure, temperature, conductivity, dissolved oxygen, fluorescence and light transmission. Discrete samples were taken in rosette-mounted Niskin bottles and analyzed for concentration of nutrients, chlorophyll a, dissolved oxygen, and particulate organic carbon and nitrogen.

22787 **The Atlantic continental margin: US: Decade of North American Geology Project.** The Geology of North America, Volume I-2. Sheridan, R.E. (Rutgers–the State Univ., New Brunswick, NJ (USA). Dept. of Geological Sciences); Grow, J.A. (eds.). 610p. The Geological Society of America, Inc., Boulder, CO (USA) (1988). Sponsored by U.S. DOE Energy Research. DOE Contract FG01-84ER13182.

The Geology of North America series has been prepared to mark the Centennial of The Geological Society of America. It represents the cooperative efforts of more than 1000 individuals from academia, state and federal agencies of many countries, and industry to prepare syntheses that are as current and authoritative as possible about the geology of the North American continent and adjacent oceanic regions. This series is part of the Decade of North American Geology (DNAG) Project which also includes eight wall maps at a scale of 1:5,000,000 that summarize the geology, tectonics, magnetic and gravity anomaly patterns, regional stress fields, thermal aspects, seismicity and neotectonics of North America and its surroundings. Together, the synthesis volumes and maps are the first coordinated effort to integrate all available knowledge about the geology and geophysics of a crustal plate on a regional scale. Topics discussed in Volume 1 include stratigraphy, depositional processes, and depositional history; basin synthesis; deep crystal structure; rifting and subsidence theory; geological resources; and environmental hazards. Individual papers were processed separately for the data base.

22788 **Sedimentary cover—North American craton: US: Decade of North American Geology Project.** The Geology of North America, Volume D-2. Sloss, L.L. (ed.) (Northwestern Univ., Evanston, IL (USA). Dept. of Geological Sciences). 620p. The Geological Society of America, Inc., Boulder, CO (USA) (1988). Sponsored by U.S. DOE Energy Research. DOE Contract FG01-84ER13182.

This volume is devoted to the Phanerozoic sedimentary strata covering the largely, but by no means exclusively, crystalline rocks of that part of the North American craton in the United States (exclusive of Alaska). Readers will note that this opening sentence implies constraints of space, time, and lithology on the subject matter dealt with here. The geographic qualifications derive from the organization structure of The Decade of North American Geology, and it only remains to point out that cratonic rocks and their histories are not delimited by national borders – nor by continental margins where these represent the lines of fission of former megacontinents. The qualifications of age and rock type are discussed on later pages, but first it is necessary to raise the question: "What is a craton?" Individual papers were processed separately for the data base.

22789 (DOE/ER/60348–12) **Continental shelf processes affecting the oceanography of the South Atlantic Bight: Progress report, June 1989–May 1990.** Atkinson, L.P. Old Dominion Univ., Norfolk, VA (USA). Dept. of Oceanography. Feb 1990. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-85ER60348. Order Number DE90008439. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

During the past year research activities have focused on analysis and synthesis of existing data from the GALE, FLEX and SPREX experiments and preparation for the WINTER-90 field experiment. The author has also spent some time assisting DOE in planning for the restructuring of the marine program. 8 refs.

22790 (EGG–10617-6062) **Regional Seismic Test Network (RSTN) operations final report.** Harrer, S.J. EG and G Energy Measurements, Inc., Albuquerque, NM (USA). Kirtland Operations. Aug 1989. 103p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC08-88NV10617. (KO–215-89). Order Number DE90008247. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

This Regional Seismic Test Network (RSTN) Operations Final Report is a history of the operations of this project. It is intended for those who were directly involved in the RSTN project, as well as for those who are involved in other similar projects. Included is a history of problems experienced at each station, functions performed by the System Control and Receiving Station (SCARS), and the performance of some crucial equipment. 9 refs.

22791 (EGG–10617-6066) **System control and receiving station quarterly report, July–September 1989.** Harrer, S.J. EG and G Energy Measurements, Inc., Albuquerque, NM (USA). Kirtland Operations. Sep 1989. 19p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC08-88NV10617. (KO–019-90). Order Number DE90008248. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This quarterly progress report discusses activities at the Seismic System Control and Receiving Station for July-September 1989. Included is a general description, a monthly summary, monthly data quality summaries, and data quality report. 4 figs., 2 tabs. (KS)

22792 (EGG-M–89247) **Site-specific strong ground motion predictions of A M 7 basin and range normal faulting earthquake in southeastern Idaho.** Wong, I. (Woodward-Clyde Consultants, Oakland, CA (USA)); Silva, W.; Darragh, R.; Stark,

C.; Wright, D.; Jackson, S.; Carpenter, G.; Smith, R. EG and G Idaho, Inc., Idaho Falls, ID (USA). [1989]. 11p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-9005115–1: 4. U.S. conference on earthquake engineering, Palm Springs, CA (USA), 20-24 May 1990). Order Number DE90006983. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Strong earthquake ground motions have been estimated for ten sites at the Idaho National Engineering Laboratory assuming that an event similar to the 1983 M_s 7.3 Borah Peak earthquake occurs along the southern segment of the Lemhi fault. The strong ground motion parameters have been estimated based on a methodology incorporating the Band-Limited-White-Noise ground motion model coupled with Random Vibration Theory. A 16-station seismic attenuation and site response survey utilizing three-component portable digital seismographs was also performed for a five-month period in 1989. Based on strong motion records of the 1983 Borah Peak earthquake and recordings of other regional earthquakes, the seismic attenuation in the shallow crust (κ) and local site response have been evaluated. These data combined with detailed geologic profiles developed for each site based principally on borehole data, were used in the estimation of the strong ground motion parameters. The peak horizontal ground accelerations for individual sites range from approximately 0.15 to 0.40 g at distances of 27 to 11 km. Based on our analysis, the thicker sedimentary interbeds in the basalt section attenuate high frequency ground motions. 22 refs., 5 figs.

22793 (LBL–24915) **FMG, RENUM, LINEL, ELLFMG, ELLP and DIMES: Chain of programs for calculating and analyzing fluid flow through two-dimensional fracture networks: Users manuals and listings.** Billaux, D.; Peterson, J.; Bodea, S.; Long, J. Lawrence Berkeley Lab., CA (USA). 30 Sep 1989. 159p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC03-76SF00098. Order Number DE90008065. Available from NTIS, PC A07/MF A01; OSTI; INIS.

The purpose of this report is to provide the user with sufficient information to run the programs FMG, RENUM, LINEL, and ELLFMG. A previous report explained the theory and the design of these programs, so that by using the two reports, a thorough understanding of the codes is possible. This report should familiarize the user with program options and modes of operation, input variables, input and output files. Information not strictly needed to run the programs, but useful in understanding their internal structure is provided in appendices. The appendices cover program variables and arrays, subroutine outlines, a short description of each subroutine, and finally listings of codes. The additional information on FMG, RENUM, LINEL, and ELLFMG is in Appendices A, C, E, G respectively, and the listings are in Appendices B, D, F, and H.

22794 (LBL–28279) **Practical aspects of Crosswell tomographic surveys.** Peterson, J.E. Jr.; Majer, E.L.; Tura, A.; Davey, A. Lawrence Berkeley Lab., CA (USA). Oct 1989. 3p. 22795 (SAND–89-2764C) **Subsurface TE scattering by tunnels using a surface line current.** Shope, S.M. (Sandia Research Associates, Inc., Corrales, NM (USA)); Wayland, J.R.; Lee, D.O. Sandia National Labs., Albuquerque, NM (USA). 1989. 4p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-900568–1: IEEE AP-S international symposium and URSI science meeting, Dallas, TX (USA), 7-11 May 1990). Order Number DE90003839. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A new technique for tunnel detection and location has recently been theoretically modeled and experimentally demonstrated. The objective of this research is to develop a general method for remotely detecting the presence of unauthorized tunneling activities using one or more boreholes and a surface source. A line current or dipole-dipole array, positioned on or near the surface of the earth, is used as the TE current source. Subsurface electric and magnetic field measurements are made in a borehole that is situated near a suspected tunnel location. The presence of a tunnel causes subsurface scattering of the field components created by the source. Both the electric and magnetic field strength and phase data is perturbed by the presence of a nearby tunnel. The scattered fields are observed on both sides of the tunnel relative to the source position. 1 fig.

22796 (UCRL–102861) **Southern oscillation in the OSU coupled upper ocean/atmosphere GCM.** Sperber, K.R. (Lawrence Livermore National Lab., CA (USA)); Gates, W.L.; Potter, G.L.; Hameed, S. Lawrence Livermore National Lab., CA (USA). Jan 1990. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (CONF-8910338–2: 14. annual climate diagnostics workshop, San Diego, CA (USA), 16-20 Oct 1989). Order Number DE90008415. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

With the advent of coupled ocean/atmosphere global climate models it has become possible to study their inherent natural variability. This natural variability arises as a consequence of the encoded physics and dynamics since the only imposed constraint on the simulation is the diurnal and annual cycle of solar radiation. One of the dominant modes of interannual variability is the Southern Oscillation (SO). The Oregon State University coupled upper ocean/atmosphere global climate model has been shown to qualitatively simulate many aspects of the SO. Sea-level pressure (SLP), sea-surface temperature (SST), thermocline layer temperature, surface air temperature, precipitation, and mixed layer currents are among the simulated fields which reproduce SO characteristics. Thus the nature of ocean/atmosphere feedback processes can be investigated. 10 refs., 2 figs.

22797 Geologic map of the surficial deposits of the Topopah Spring quadrangle, Nye County, Nevada. Swadley, W.C.; Hoover, D.L. vp.Geological Survey, Reston, VA (US) (1989).

A geologic map of the surficial deposits of the Topopah Spring quadrangle, Nye County, Nevada is presented.

22798 Geochemistry, isotopic composition, and origin of fluids emanating from mud volcanoes in the Copper River basin, Alaska. Motyka, R.J. (Alaska Div. of Geological and Geophysical Surveys, Juneau (USA)); Poreda, R.J.; Jeffrey, A.W.A. *Geochimica et Cosmochimica Acta (USA),* 53(1): 29-41 (Jan 1989). DOE Contract FG07-84ID12524;AC21-84MC21131.

Analyses of waters and gases from the Copper River basin, Alaska, show marked differences in the fluid chemistries of two groups of mud-volcano saline springs. The Tolsona group discharges Na-Ca rich, HCO_3-SO_4 poor saline waters accompanied by small amounts of CH_4, N_2, and He. Tolsona gases have $^3He/^4He$ ratios of 0.75 to 2.7 (R/R_{atm}), $\delta^{13}C$-CH_4 values of −33 to −22 per mil, and $\delta^{15}N$ values of −1.8 to +1.6 per mil. The Klawasi group discharges Ca poor, Na-HCO_3 rich saline waters with large amounts of CO_2 and $^3He/^4He$ ratios of 2.6 to 4.1 (R/R_{atm}), $\delta^{13}C$-CO_2 values of −4.8 to −3.1 per mil, $\delta^{13}C$-CH_4 values of −23 to −18 per mil, and $\delta^{15}N$ of −3.5. Spring waters are strongly enriched in Li, Na, K, Mg, HCO_3, SO_4, B, SiO_2, As and ^{18}O and strongly depleted in Ca, Sr and deuterium. The differences in fluid chemistry are attributed to the interaction of CO_2 with Tolsona-type formation waters. The CO_2 is thought to be derived from a deep-seated magmatic intrusive and contact decarbonation of limestone beds underlying the Klawasi area.

22799 Significant cenozoic faulting, east margin of the Espanola basin, Rio Grande Rift, New Mexico. Vernon, J.H. (Los Alamos National Lab., NM (USA)); Riecker, R.E. *Geology (USA),* 17(3): 230-233 (Mar 1989).

Tectonic interpretation of the east margin of the Espanola Basin, Rio Grande rift, New Mexico, has been controversial. Previous authors have disagreed as to whether significant faulting defines the boundary between the basin and the Sangre de Cristo Mountains. A more recent geophysical basin transect that suggests no significant faulting and field observation of faceted spurs along the western Sangre de Cristo Mountain front indicating a faulted margin motivate our study. The east margin of the Espanola Basin for

about 37 km north of Santa Fe, New Mexico, is marked by a complex array of significant, late Cenozoic high-angle faults. Locally, three parallel, north-trending, high-angle faults cut Precambrian basement and Tertiary basin-full rocks along the basin margin. Elsewhere along the margin, tilted fault blocks and intersecting faults occur. Fault area, fault attitude with depth, magnitude of fault motion, and timing of fault motion remain uncertain. However, faults studied in detail are 1-2 km long, have minimum dip-slip motion of 33-100 m, and underwent movement during the late Cenozoic. Potentially significant tectonic and seismic hazard implications arise from the possibility of post-150 ka fault motion.

22800 Sodium-calcium ion exchange in the weathering of shales: implications for global weathering budgets. Cerling, T.E. (Univ. of Utah, Salt Lake City (USA)); Pederson, B.L.; Von Damm, K.L. *Geology (USA)*, 17(6): 552-554 (Jun 1989). DOE Contract AC05-84OR21400.

Unpolluted rivers and streams that drain marine shales show an excess of sodium compared to chloride and a deficiency of calcium and magnesium compared to sulfate and alkalinity. This is due in part to cation exchange of sodium for divalent cations on clay minerals. Consideration of the global weathering budget suggest that up to 34% of the sodium in the total dissolved stream load may be due to cation exchange rather than sodium production via silicate dissolution weathering reactions. These results suggest that the weather budgets for sodium and calcium are in need of revision because of the inclusion of cation-exchange processes in the weathering cycle. This implies that silicate dissolution is less important in determining the composition of global river water than was previously thought.

22801 Environmental hazards of pyroclastic flows determined by numerical models. Valentine, G.A. (Los Alamos National Lab., NM (USA)); Wholetz, K.H. *Geology (USA)*, 17(7): 641-644 (Jul 1989).

Numerical solutions of the compressible, multiphase Navier-Stokes equations are applied to conditions appropriate for the development of pyroclastic flows from collapsing Plinian eruption columns. Temporal and spatial variations in horizontal velocity, dynamic pressure, solid volume fraction, and temperature are analyzed for three experiments that model variations in behavior due to differing eruption conditions. Pyroclastic flows display a complex evolution with time and runout distance for the vent. Evolution of flow parameters is most generally manifested by alternating periods of erosion and deposition. Velocities of flow heads decrease and solid concentrations in the flow heads increase with distance from vent. Application of numerical modeling to such phenomena can help in assessing volcanic hazards and pyroclastic transport processes.

22802 Isotopic evidence for paleohydrologic evolution of ground-water flow paths, southern great plains, United States. Dutton, A. (Univ. of Texas, Austin (USA)); Simpkins, W.W. *Geology (USA)*, 17(7): 653-656 (Jul 1989).

A confined aquifer in Triassic Dockum Group sandstone beneath the southern Great Plains was isolated from hypothesized paleorecharge areas in eastern New Mexico by Pleistocene erosion of the Pecos and Canadian river valleys and formation of hydrologic divides. Truncation of the flow system left meteoric water in the confined aquifer with mean δD and $\delta^{18}O$ values that are 17°/oo and 2.0°/oo, respectively, lighter than those in the overlying High Plains aquifer. Thick upper Dockum mudstone retards downward flow from the High Plains aquifer, which has been recharged by isotopically heavy precipitation during the Holocene. Recharge to the confined aquifer occurred at altitudes of 1600 to 2200 m in proximal Dockum sandstone facies since eroded in eastern New Mexico, at a mean temperature 3 C cooler than present temperature across the southern High Plains. Effect of Pleistocene climatic change on isotopic composition of Dockum ground water could be superposed over geomorphologic effects.

22803 Copper and nickel partitioning in iron meteorites. Sutton, S.R. (Brookhaven National Lab., Upton, NY (USA)); Smith, J.V.; Delaney, J.S.; Prinz, M. *Geochimica et Cosmochimica Acta (USA)*, 51(10): 2653-2662 (Oct 1987). DOE Contract AC02-76CH00016.

Trace element analyses using proton induced x-ray emission (PIXE) and synchrotron x-ray fluorescence (SXRF) have been made on metal and troilite from 9 iron meteorites representing 5 geochemical groups. Nickel and copper distribution coefficients D (troilite/metal) vary by factors of 600 and 20, respectively, correlate positively with kamacite band width and correlate negatively with bulk nickel content. Meteorites with bulk Ni < 10% have Cu-enriched troilite ($D_{Cu} > 1$) while those with Ni > 10% have Cu-depleted troilite ($D_{Cu} < 1$). Since magmatic evolution and partial melting will produce Cu-enriched troilite only, the observation of Cu-depleted troilite in Ni-rich meteorites is evidence for subsolidus re-equilibration, a process which reduces D_{Cu} by transfer of Cu to exsolving metal. Elemental redistribution may have played an important role in establishing the present chemical trends in iron meteorites.

22804 (AD-A–214725/4/XAB) **MHD (magnetohydrodynamic) slow shocks in coronal and interplanetary space. Final report, 1 June 1986-31 May 1989.** Whang, Y.C. Catholic Univ. of America, Washington, DC (USA). Dept. of Mechanical Engineering. Aug 1989. 34p. Available from NTIS, PC A03/MF A01.

The overall objective of this project is to study shock waves of the solar terrestrial medium in coronal and interplanetary space. This research will enhance our understanding on the propagation of large-amplitude disturbances from the solar corona through the interplanetary space. Work accomplished during the past three years includes: (1) a demonstrating example showing the formation of slow shock pairs associated with CMEs in a coronal environment; (2) a parametric study of slow shocks in the entire domain of a three-dimensional parameter space, the A, theta, Beta-space; (3) the large scale geometry of traveling interplanetary shocks; (4) the transition of slow shocks to fast shocks in the inner solar wind; and (5) the evolution of CME associated shocks and their interplanetary manifestations.

22805 (AD-A–214801/3/XAB) **Study of solar oscillations. Final report, 1 April 1980-31 March 1981.** Hill, H.A. Arizona Univ., Tucson, AZ (USA). Dept. of Physics. 5 Jun 1981. 12p. Available from NTIS, PC A03/MF A01.

Recent observational evidence on solar oscillations is reviewed; this evidence strongly favors the global interpretation for much of the observed spectrum. Implications of these observations for the study of the solar interior and atmosphere are discussed. An observational program and supporting theoretical program are described in which the oscillations are detected via solar-diameter measurements at Santa Catalina Lab. for Experimental Relativity by Astrometry. The main goal of these programs is the classification of the observed modes of oscillation. Results will be used to infer information about the internal rotation of the sun, the depth of the convection zone, and other properties of the internal structure of the sun.

22806 (AD-A–215028/2/XAB) **Solar-cycle effects on trapped energetic particles. Technical report.** Vampola, A.L. Aerospace Corp., El Segundo, CA (USA). Space Sciences Lab. 15 Oct 1989. 47p. (TR–0089(4940-05)-3). Available from NTIS, PC A03/MF A01.

The energetic-particle populations in the earth's magnetosphere, which are the result of geomagnetic activity and, ultimately, are due to solar activity, have a major impact on the operation and survival of spacecraft. Departures from the nominal in solar activity produce requirements for changes from the nominal in the design and operation of spacecraft. If the approaching solar maximum is a robust one, as is indicated by preliminary solar data, the energetic particle population can be expected to be in excess of that predicted by particle models such as AE8 and AP8, since those models include solar-cycle effects based on nominal solar activity. In the event of a robust solar cycle, accelerated degradation of electronics and power systems, increased sensor background effects, and more

frequent operational anomalies may be expected on spacecraft which were designed for a nominal energetic particle population that could be expected based on a robust solar Cycle 22.

22807 (CEA-CONF–9815) **The non-linear universe from 0.01 to 100 Mpc.** Schaeffer, R. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service de Physique Theorique. 1988. 34p. (CONF-8808293–: 11. Cracow Summer School, Cracow (Poland), 22-31 Aug 1988). Order Number DE90756365. Available from NTIS (US Sales Only), PC A03/MF A01.

The luminosity function of galaxies and clusters as well as their correlations can be calculated assuming the many-body correlation functions are scale invariant. The same hypothesis leads to predictions of the galaxy counts in cells that are seen to be of the Schechter form and to predictions of the fractal dimension of the galaxy distribution. The latter is found to be bifractal, that is characterized by two dimensions $D=3-\gamma$ in the cluster region, and $D = (3-\gamma)(2+\alpha)$ in the nearly empty regions, α being the Schechter index for the galaxy luminosity function. Finally, the same models lead to predictions for the evolution of the cluster and X-ray luminosity functions, as well as for the Sunyaev-Zeldovich effect due to all virialized clusters, which is found to be large and to produce fluctuations of order 10^{-5} at sub-arc minute scales in the microwave background.

22808 (CONF-8309418–) **An international discussion on research in solar and space physics.** National Research Council, Washington, DC (USA). 1983. 37p. From Workshop on solar and space physics; Hilton Head, SC (USA); 20-23 Sep 1983. Available from NTIS, PC A03/MF A01.

This report is the result of a four-day workshop convened jointly by the U.S. National Academy of Sciences/National Research Council and the European Science Foundation (ESF). Fifty scientists from thirteen nations attended, representing the U.S. Space Science Board (SSB) and the ESF's Space Science Committee (SSC), for the purpose of investigating the prospects for more effective cooperation in research in solar and space physics. Discussions during the workshop concerned: (1) the status of solar and space physics as academic subjects, in order to investigate the potential for the future of these research areas in terms of the training of new scientists; (2) the future plans and programs of National Aeronautics and Space Administration (NASA), European Space Agency (ESA), and several European countries, in order to assess the potential for cooperation in expected research opportunities; and (3) U.S./European cooperation in terms of past successes and problems. Much of the discussion concerned the differences between the U.S. and European systems in the planning of space programs, initiating missions, and selecting and developing experiments. It was recommended that an international solar and space physics program should be established and that it should be constructed from currently planned missions by ESA and NASA.

22809 (INIS-SU–155) **Wind instability as a possible cause of the spiral structure formation in the gaseous subsystem of galaxies with the circular magnetic field.** Gestrin, S.G. AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Radioastronomicheskij Inst. 1988. 19p. (In Russian). Order Number DE90618944. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Preprint no.16.

The wind instability as the possible cause of the spiral structure in the gaseous subsystems of galaxies with the circular magnetic field. It is shown that in the presence of sufficiently strong circular magnetic field typical for some galaxies very weak peculiarity on the rotation curve which is provide for the existence of the localized surface mode is required for the development of the wind instability. This peculiarity is the jump of the second derivative from the angular velocity. It is necessary also that magnetic field grow or fall down slower than 1/r with the distance from the galactic centre. In this case the spiral structure arises with the number of arms being defined by the ratio between the rotation velocity near the peculiarity and the Alfven speed in the disc. 12 refs.; 2 figs.

22810 (INIS-SU–156) **Jupiter's drifting decametric bursts with the changing time scale.** Gerasimova, N.N. AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Radioastronomicheskij Inst. 1988. 21p. (In Russian). Order Number DE90618870. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Preprint no.18.

The drifting burst class with the changing time scale for each event is selected from the observational data of the Jovian decametric emission obtained with the radiotelescope UTR-2. The burst duration at fixed frequency changes from few seconds (or a fractions of a second) at frequencies f=10-12 MHz to less then 0.02 s (the time constant of the registration) at frequencies f=12-17 MHz. The model in which electron beams streaming from the planet generate plasma natural oscillations at the frequency around the electron gyrofrequency is proposed. Presence of the regular and irregular inhomogeneities of the magnetic field and density could provide both hydrodynamic and kinetic character of the instability during the individual event. This fact leads to the sharp change of the time scales in the limits of one event. 15 refs.; 4 figs.; 2 tabs.

22811 (LA-UR–90-432) **M51's spiral structure.** Howard, S. (Los Alamos National Lab., NM (USA)); Byrd, G.G. Los Alamos National Lab., NM (USA). [1989]. 6p. Sponsored by U.S. DOE Defense Programs; National Science Foundation. DOE Contract W-7405-ENG-36. RII8610669. (CONF-891278–1: Astrophysics meeting, Tuscalosa, AL (USA), 3-7 Dec 1989). Order Number DE90007624. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The M51 system (NGC 5194/5195) provides an excellent problem both in spiral structure and in galaxy interactions. We present an analytic study of a computer experiment on the excitation mechanisms for M51's spiral arms and whether or not a halo is important for these mechanisms. This work extends previous numerical studies of the M51 system by including self-gravitation in a two component disk: 'gas' and 'stars', and a dark halo. The analytic study provides two new observational constraints: the time ($\approx$70-84 million years ago) and position angle of perigalacticon (300°). By using these constraints and a simple conic approximation, the search for the companion's possible orbit is greatly simplified. This requires fewer N-body simulations than a fully self-gravitating orbit search. 8 refs., 4 figs.

22812 (N–90-13297) **Evolution of domain walls in the early universe. Ph.D. Thesis - Chicago Univ.** Kawano, L. Fermi National Accelerator Lab., Batavia, IL (USA). Oct 1989. 30p. (NASA-CR–186076;NAS–1.26:186076;FERMILAB-PUB–89/208-A). Available from NTIS, PC A03/MF A01.

The evolution of domain walls in the early universe is studied via 2-D computer simulation. The walls are initially configured on a triangular lattice and then released from the lattice, their evolution driven by wall curvature and by the universal expansion. The walls attain an average velocity of about 0.3c and their surface area per volume (as measured in comoving coordinates) goes down with a slope of -1 with respect to conformal time, regardless of whether the universe is matter or radiation dominated. The additional influence of vacuum pressure causes the energy density to fall away from this slope and steepen, thus allowing a situation in which domain walls can constitute a significant portion of the energy density of the universe without provoking an unacceptably large perturbation upon the microwave background.

22813 (N–90-14076) **Observational physics of mirror world.** Khlopov, M.YA.; Beskin, G.M.; Bochkarev, N.E.; Pustilnik, L.A.; Pustilnik, S.A. AN SSSR, Moscow (USSR). Sep 1989. 28p. (NASA-CR–185923;NAS–1.26:185923;FERMILAB-PUB–89/193-A). Available from NTIS, PC A03/MF A01.

The existence of the whole world of shadow particles, interacting with each other and having no mutual interactions with ordinary particles except gravity is a specific feature of modern superstring models, being considered as models of the theory of everything. The presence of shadow particles is the necessary condition in the superstring models, providing compensation of the asymmetry of left and right chirality states of ordinary particles. If compactification of additional dimensions retains the symmetry of left and right states, shadow world turns to be the mirror one, with particles and fields having properties strictly symmetrical to the ones of corresponding ordinary particles and fields. Owing to the strict symmetry of physical laws for ordinary and mirror particles, the analysis of

cosmological evolution of mirror matter provides rather definite conclusions on possible effects of mirror particles in the universe. A general qualitative discussion of possible astronomical impact of mirror matter is given, in order to make as wide as possible astronomical observational searches for the effects of mirror world, being the unique way to test the existence of mirror partners of ordinary particles in the Nature.

22814 (N–90-14154) **An implementation plan for priorities in solar-system space physics.** Krimigis, S.M.; Athay, R.G.; Baker, D.; Fisk, L.A.; Fredricks, R.W.; Harvey, J.W.; Jokipii, J.R.; Kivelson, M.; Mendillo, M.; Nagy, A.F. National Research Council, Washington, DC (USA). 1985. 83p. (NASA-CR–185375;NAS–1.26:185375). Available from NTIS, PC A05/MF A01.

The scientific objectives and implementation plans and priorities of the Space Science Board in areas of solar physics, heliospheric physics, magnetospheric physics, upper atmosphere physics, solar-terrestrial coupling, and comparative planetary studies are discussed and recommended programs are summarized. Accomplishments of Skylab, Solar Maximum Mission, Nimbus-7, and 11 other programs are highlighted. Detailed mission plans in areas of solar and heliospheric physics, plasma physics, and upper atmospheric physics are also described.

22815 (N–90-14156) **Further observations of rotationally excited far infrared OH16 and OH18 emission in Orion-KL: Tighter constraints on the nature of the emitting region.** Melnick, G.J.; Stacey, G.J.; Genzel, R.; Lugten, J.B.; Poglitsch, A. Max-Planck-Institut fuer Physik und Astrophysik, Garching (Germany, F.R.). Jul 1989. 33p. (NASA-CR–186004;NAS–1.26:186004;MPE-PREPRINT–156;ETN–89-95858). Available from NTIS, PC A03/MF A01.

The Orion-KL region, within 1 arc minute, is observed. The rotational cross ladder (53.351 microns) and rotational ground state (120.1719 microns) transitions are studied. It is shown that these lines exhibit a P-Cygni profile and unambiguously show that the OH gas is expanding out from the central BN-KL infrared cluster. The OH-16 rotational ground state transition (119.234 microns) is velocity resolved and it is found that its intrinsic full width at half maximum is 75 km/s. The line fluxes and line profiles are modeled and it is shown that no single temperature and density component can reproduce the data. Rather, the best fit to the data requires emission from three main components of the gas: post shocked gas with the profiles of temperature, density, and OH abundance; a high density component to the cool post shocked region; and the plateau region.

22816 (N–90-14160) **The winds of high luminosity late-type bright stars. Final report, 15 June 1986-14 June 1989.** Stencel, R.E.; Carpenter, K.G. National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center. 1989. 9p. (NASA-CR–182961;NAS–1.26:182961). Available from NTIS, PC A02/MF A01.

The occurrence and characteristics of the Fe II line asymmetries were studied to determine the radial dependence of the wind velocity for each star. The dependence of the Fe II profiles on spectral type and luminosity class and thus the variation of the velocity fields with stellar type was also investigated. This allows the generality of the results reported for alpha Ori by Carpenter (1984b) to be judged. In addition, new atomic data was used along with observations of the C II (UV 0.01) multiplet to estimate N(sub e) in the stellar winds. Measures of relative Fe II fluxes can be used in a probability-of-escape model to determine the opacity and hydrogen column density versus height in the chromosphere of each star. Finally, analysis of the fluorescent Fe II lines (pumped by Ly alpha) near 2507 A will yield estimates of the intrinsic stellar Ly alpha flux that cannot be measured directly because of interstellar and circumstellar absorption. One important goal of the effort was to acquire high resolution spectra of the whole 2300 to 3200 A region of 13 luminous K and M stars as a data base that will be enormously valuable in planning observations with the Hubble Space Telescope High Resolution Spectrograph. It is also proposed to follow up the recent discovery of significant variations in the Fe II chromospheric emission line profiles from the M-giant Gamma Cru for the purpose of determining the underlying cause of the variations.

22817 (N–90-14163) **Archival research on absorption lines in violently star-forming galaxies.** Gallagher, J.S. Lowell Observatory, Flagstaff, AZ (USA). Planetary Research Center. Sep 1989. 7p. (NASA-CR–185960;NAS–1.26:185960). Available from NTIS, PC A02/MF A01.

A computerized analysis of a starburst model is discussed. The model proposes that the absorption line equivalent width should scale with the level of star forming activity. Archival International Ultraviolet Explorer (IUE) data on IUE spectra of luminous blue galaxies were compared with previous IUE observations of extragalactic HII regions and low luminosity galaxies. The comparisons are summarized and causes for offsets are discussed.

22818 (N–90-14167) **Presented at the International Nuclear Physics Conference, Sao Paulo, Brazil, 20-26 August 1989.** Schramm, D.N. Fermi National Accelerator Lab., Batavia, IL (USA). Dec 1989. 13p. (NASA-CR–186166;NAS–1.26:186166;FERMILAB-CONF–89/254-A: International nuclear physics and cosmology conference, Sao Paulo (Brazil), 20-26 Aug 1989; CONF-890826–). Available from NTIS, PC A03/MF A01.

Nuclear physics has provided one of two critical observational tests of all Big Bang cosmology, namely Big Bang Nucleosynthesis. Furthermore, this same nuclear physics input enables a prediction to be made about one of the most fundamental physics questions of all, the number of elementary particle families. The standard Big Bang Nucleosynthesis arguments are reviewed. The primordial He abundance is inferred from He-C and He-N and He-O correlations. The strengthened Li constraint as well as D-2 plus He-3 are used to limit the baryon density. This limit is the key argument behind the need for non-baryonic dark matter. The allowed number of neutrino families, N(nu), is delineated using the new neutron lifetime value of tau(n) = 890 + or - 4s (tau(1/2) = 10.3 min). The formal statistical result is N(nu) = 2.6 + or - 0.3 (1 sigma), providing a reasonable fit (1.3 sigma) to three families but making a fourth light (m(nu) less than or equal to 10 MeV) neutrino family exceedly unlikely (approx. greater than 4.7 sigma). It is also shown that uncertainties induced by postulating a first-order quark-baryon phase transition do not seriously affect the conclusions.

22819 (N–90-14168) **Big Bang nucleosynthesis and the quark-hadron transition.** Kurki-suonio, H.; Matzner, R.A.; Olive, K.A.; Schramm, D.N. Drexel Univ., Philadelphia, PA (USA). Dec 1989. 21p. (NASA-CR–186169;NAS–1.26:186169;FERMILAB-PUB–89/252-A). Available from NTIS, PC A03/MF A01.

An examination and brief review is made of the effects of quark-hadron transistion induced fluctuations on Big Bang nucleosynthesis. It is shown that cosmologically critical densities in baryons are difficult to reconcile with observation, but the traditional baryon density constraints from homogeneous calculations might be loosened by as much as 50 percent, to 0.3 of critical density, and the limit on the number of neutrino flavors remains about N(sub nu) is less than or approximately 4. To achieve baryon densities of greater than or approximately 0.3 of critical density would require initial density contrasts R much greater than 10(exp 3), whereas the simplest models for the transition seem to restrict R to less than approximately 10(exp 2).

22820 (N–90-14176) **Analysis of coordinated observations of a giant stellar flare. Final Technical report, 1 March 1988-31 August 1989.** Lambert, D.L. Texas Univ., Austin, TX (USA). Oct 1989. 8p. (NASA-CR–185961;NAS–1.26:185961). Available from NTIS, PC A02/MF A01.

Multi-wavelength observations of a giant flare on the star AD Leo were obtained with the 2.1 m and 0.9 m telescopes at McDonald Observatory and the International Ultraviolet Explorer satellite. The quality, spectral coverage, and time resolution of the data represented a major improvement over any published stellar flare data. Two theoretical, quantitative flare models were developed. Combining the models, the chromospheric emission model predictions in the hydrogen Balmer lines, Da II K, Mg II h + k and the optical continuum were compared to the observations, with the result that much of the gradual phase flare emission could be produced by the x ray and conductive heated atmospheres. The models lend insight into the impulsive phase flare emission, but do not reproduce it. Soft x ray and conductive heating of the chromosphere is a natural consequence of the coronal temperatures that have been

observed during the gradual phase of flares on the sun and on M dwarf stars. The improved flare observations and quantitative flare models presented here show that these heating mechanisms can produce atmospheres whose emission matches many of the observed stellar flare features.

22821 (N–90-14178) **Shear-induced inflation of coronal magnetic fields.** Klimchuk, J.A. Stanford Univ., CA (USA). Aug 1989. 40p. (NASA-CR–186103;NAS–1.26:186103;CSSA-ASTRO–89-11). Available from NTIS, PC A03/MF A01.

Using numerical models of force-free magnetic fields, the shearing of footprints in arcade geometries leading to an inflation of the coronal magnetic field was examined. For each of the shear profiles considered, all of the field lines become elevated compared with the potential field. This includes cases where the shear is concentrated well away from the arcade axis, such that B(sub z), the component of field parallel to the axis, increases outward to produce an inward B(sub z)squared/8 pi magnetic pressure gradient force. These results contrast with an earlier claim, shown to be incorrect, that field lines can sometimes become depressed as a result of shear. It is conjectured that an inflation of the entire field will always result from the shearing of simple arcade configurations. These results have implications for prominence formation, the interplanetary magnetic flux, and possibly also coronal holes.

22822 (N–90-14998) **Abstracts for the 52nd Annual Meeting of the Meteoritical Society.** Lunar and Planetary Inst., Houston, TX (USA). 1989. 337p. (NASA-CR–186160;NAS–1.26:186160;LPI-CONTRIB–712:CONF-8907185–: 52. annual meeting of the meteoritical society, Vienna (Australia), 31 Jul - 4 aug 1989). Available from NTIS, PC A15/MF A02.

Various topics in meteorology are discussed. These topics include chondrites, chondrule, iron and other minerals, impact cratering, lunar studies, early earth and early solar system processes, rare gases and cosmic dust.

22823 (N–90-15004) **Meteoritic basalts. Final report, 1986-1989.** Treiman, A.H. Boston Univ., MA (USA). Oct 1989. 27p. (NASA-CR–185949;NAS–1.26:185949). Available from NTIS, PC A03/MF A01.

The objectives were to: explain the abundances of siderophile elements in the SNC meteorite suite, of putative Martian origin; discover the magmatic origins and possibly magma compositions behind the Nakhla meteorite, one of the SNC meteorites; and a re-evaluation of the petrology of Angra dos Reis, a unique meteorite linked to the earliest planetary bodies of the solar nebula. A re-evaluation of its petrography showed that the accepted scenario for its origin, as a cumulate igneous rock, was not consistent with the meteorite's textures (Treiman). More likely is that the meteorite represents a prophyritic igneous rock, originally with magma dominant. Studies of the Nakhla meteorite, of possible Martian origin, although difficult, were successful. It became necessary to reject the basic categorization of Nakhla: that is was a cumulate igneous rock. Detailed studies of the chemical zoning of Nakhlas' minerals, coupled with the failure of experimental studies to yield expected results, forced the conclusion that Nakhla is not a cumulate rock in the usual sense: a rock composed of igneous crystals and intercrystal magma. Study of the siderophile element abundances in the SNC meteorite groups involved trying to find reasonable core formation processes and parameters that would reproduce the observed abundances. Modelling was successful, and delimited a range of models which overlap with those reasonable from geophysical constraints.

22824 (N–90-15036) **The solar activity measurements experiments (SAMEX) for improved scientific understanding of solar activity.** National Aeronautics and Space Administration, Huntsville, AL (USA). George C. Marshall Space Flight Center. 1989. 27p. (NASA-TM–100372;NAS–1.15:100372). Available from NTIS, PC A03/MF A01.

Original contains color illustrations.

The Solar Activity Measurements Experiments (SAMEX) mission is described. It is designed to provide a look at the interactions of magnetic fields and plasmas that create flares and other explosive events on the sun in an effort to understand solar activity and the nature of the solar magnetic field. The need for this mission, the instruments to be used, and the expected benefits of SAMEX are discussed.

22825 (PB–90-855305/XAB) **Allende meteorite: Cosmic rosetta stone. September 1972-November 1989 (Citations from the International Aerospace Abstracts data base). Report for September 1972-November 1989.** National Technical Information Service, Springfield, VA (USA). Jan 1990. 89p. Available from NTISPC N01/MF N01.

U.S. sales only.

This bibliography contains citations concerning the Allende meteorite. This carbonaceous chondrite has been the source of numerous, diverse inclusions. Structural and chemical analyses of these inclusions have aided in cosmological studies of the age of the solar system. Analytical techniques for many elements and minerals, and the interpretation of the results obtained, are discussed. This meteorite has provided information on the formation of complex chemical species and structures during the formation of the solar system. Allende is one of the most studied carbonaceous chondritic meteorites and is, therefore, one of the most important sources of information on the early solar system. (Contains 190 citations fully indexed and including a title list.)

22826 (RAL–89-098) **Use of Al XII and Mg XI lines as solar plasma diagnostics.** Bromage, B.J.I. (Rutherford Appleton Lab., Chilton (UK)); Phillips, K.J.H.; Keenan, F.P.; McCann, S.M. Rutherford Appleton Lab., Chilton (UK). Sep 1989. 16p. Order Number DE90618845. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

We present three sets of observations of n=1 to n=2 lines due to helium-like aluminium (Al XII), made during two solar flares (25 August, 1980 and 19 October, 1986), using the X-ray Polychromator on satellite. The observed temperature-sensitive line ratio G is shown to be consistent with previously observed close-coupling calculations, although the ratio R, which is both temperature and density-sensitive for lower-Z elements, is not sufficiently well determined from these data to say more than that the observed values of R are not inconsistent with the theoretical calculations. This region of the spectrum also includes the helium-like magnesium (Mg XI) 1^1S-3^1P line, and it is shown that the ratio of this line to the Al XII resonance (1^1S-2^1P) line is a more sensitive indicator of electron temperature than are the Al XII G and R ratios. We demonstrate that the three ratios may be used together in order to derive values of emission measure, electron temperature and electron density during these flares. (author).

22827 (RAL–89-102) **Proceedings of the second workshop on thermal-non-thermal interactions in solar flares [TNT-II]: Held at Somerville College, University of Oxford, England on April 10 - 14, 1989 and arranged by Rutherford Appleton Laboratory, Chilton, Didcot, Oxon., England.** Phillips, K.J.H. (ed.). Rutherford Appleton Lab., Chilton (UK). Sep 1989. 84p. (CONF-8804323–: 2. workshop on thermal-non-thermal interactions in solar flares, Oxford (UK), 10-14 Apr 1988). Order Number DE90618846. Available from NTIS (US Sales Only), PC A05/MF A01; OSTI; INIS.

The Second Workshop on the theme of Thermal-Non-thermal Interactions in Solar Flares (TNT-II) was held at Somerville College, University of Oxford, England, during the week of April 10-14, 1989. The keynote address, gave a view of the problems still outstanding with regard to soft and hard X-ray observations of flares. The gathering broke up into four subgroups. The subjects under discussion were: large-scale magnetic field phenomena, flare dynamics, energy release and deposition, and global energy balance. (author).

22828 (RAL–89-102, pp. 1.1-1.19) **Large scale magnetic field phenomena.** Harrison, R.A. (Rutherford Appleton Lab., Chilton (UK)); Bentley, R.D.; Brosius, J. Rutherford Appleton Lab., Chilton (UK). Sep 1989. (CONF-8804323–: 2. workshop on thermal-non-thermal interactions in solar flares, Oxford (UK), 10-14 Apr 1988). In *Proceedings of the second workshop on thermal-non-thermal interactions in solar flares [TNT-II]: Held at Somerville College, University of Oxford, England on April 10 - 14, 1989 and arranged by Rutherford Appleton Laboratory, Chilton, Didcot, Oxon., England.* Order Number DE90618846. Available from NTIS (US Sales Only), PC A05/MF A01; OSTI; INIS.

This study group had interests ranging from coronal mass ejections and magnetic modelling to active region heating and post-flare loops. Two main areas of discussion were concerned with the results from two major observing campaigns, namely the Coronal Mass Ejection Onset Programme (CMEOP) and the Coronal Magnetic Structures Observing Campaign (CoMStOC), and several theoretical experts were on hand to address the consequences of these programmes. The following report is divided into three sections: Coronal Mass Ejections; Large Scale Coronal Magnetic Fields and Flare Activity in Relation to Coronal Magnetic Fields. (author).

22829 (RAL–89-102, pp. 2.1-2.25) **Flare dynamics.** Zarro, D. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center); Alexander, D.; Fludra, A. Rutherford Appleton Lab., Chilton (UK). Sep 1989. (CONF-8804323–: 2. workshop on thermal-non-thermal interactions in solar flares, Oxford (UK), 10-14 Apr 1988). In *Proceedings of the second workshop on thermal-non-thermal interactions in solar flares [TNT-II]: Held at Somerville College, University of Oxford, England on April 10 - 14, 1989 and arranged by Rutherford Appleton Laboratory, Chilton, Didcot, Oxon., England.* Order Number DE90618846. Available from NTIS (US Sales Only), PC A05/MF A01; OSTI; INIS.

This report presented by Group 2 of the Second Workshop of Thermal-Non-thermal Interactions in Solar Flares, summarizes the discussions into a series of questions covering such areas as the relationship between flare heating and chromospheric evaporation, the nature of flare heating mechanisms and excess broadening during the impulsive and gradual decay phases of flares. (UK).

22830 (RAL–89-102, pp. 3.1-3.26) **Flare energy release and deposition.** Holman, G. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center); Benka, S.; De La Beaujardiere, J. Rutherford Appleton Lab., Chilton (UK). Sep 1989. (CONF-8804323–: 2. workshop on thermal-non-thermal interactions in solar flares, Oxford (UK), 10-14 Apr 1988). In *Proceedings of the second workshop on thermal-non-thermal interactions in solar flares [TNT-II]: Held at Somerville College, University of Oxford, England on April 10 - 14, 1989 and arranged by Rutherford Appleton Laboratory, Chilton, Didcot, Oxon., England.* Order Number DE90618846. Available from NTIS (US Sales Only), PC A05/MF A01; OSTI; INIS.

Group 3 of the Second Workshop of Thermal-Non-thermal Interactions in Solar Flares concentrated their discussions on flare energy release and deposition. Presentations on electron energization, proton acceleration, mirroring, scattering, and precipitation and energy deposition. Each topic is briefly explored in this report. (UK).

22831 (RAL–89-102, pp. 4.1-4.14) **The global energy balance in flares.** Simnett, G.M. (Birmingham Univ. (UK)); Linford, G.A.; Metcalf, T.R. Rutherford Appleton Lab., Chilton (UK). Sep 1989. (CONF-8804323–: 2. workshop on thermal-non-thermal interactions in solar flares, Oxford (UK), 10-14 Apr 1988). In *Proceedings of the second workshop on thermal-non-thermal interactions in solar flares [TNT-II]: Held at Somerville College, University of Oxford, England on April 10 - 14, 1989 and arranged by Rutherford Appleton Laboratory, Chilton, Didcot, Oxon., England.* Order Number DE90618846. Available from NTIS (US Sales Only), PC A05/MF A01; OSTI; INIS.

A key issue in flare energetics is the mechanism through which the energy is transferred from the coronal magnetic field to the heated flare plasma. Recently it has become an issue as to whether non-thermal, mildly-relativistic electrons of non-thermal, but low energy ions dominate this process. We first review briefly the nature of the problem; then we discuss some relevant, key observations; and finally we outline three specific research areas where future developments may provide definitive answers to questions of global flare energetics. (author).

22832 (UCRL–98567) **Mars in this century: The Olympia Project.** Hyde, R.A.; Ishikawa, M.Y.; Wood, L.L. Lawrence Livermore National Lab., CA (USA). [1988]. 17p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8804105–2: 4. national space symposium, Colorado Springs, CO (USA), 12-15 Apr 1988). Order Number DE90008356. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Manned exploration of the inner solar system — typified by a manned expedition to Mars — this side of the indefinite future involves fitting a technical peg into the political hole. If Apollo-level resources are assumed unavailable for such exploratory programs, then non-Apollo means and methods must be employed, involving greater technical and human risks, or else such exploration must be deferred indefinitely. Sketched here is an example of such a relatively high-risk alternative, one which could land men on Mars in the next decade, and return them to earth. Two of its key features are a teleoperated rocket fuel-generating facility on the lunar surface and an interplanetary mission-staging space station at L_4, which would serve to enable a continuing solar system exploratory program, with annual mission commencements to points as distant as the Jovian moons. The estimated cost-to-execute this infrastructure-building manned Mars mission is $3 billion, with follow-on missions estimated to cost no more than $1 billion each. 3 figs., 2 tabs.

22833 The Explorer program for astronomy and astrophysics. Savage, B.D.; Becklin, E.E.; Cassinelli, J.P.; Dupree, A.K.; Elliot, J.L.; Hoffmann, W.F.; Hudson, H.S.; Jura, M.; Kurfess, J.; Murray, S.S. 60p. National Academy of Sciences - National Research Council, Washington, DC (US) (1986).

Original contains color illustrations.

This report was prepared to provide NASA with a strategy for proceeding with Explorer-class programs for research in space astronomy and astrophysics. The role of Explorers in astronomy and astrophysics and their past accomplishments are discussed, as are current and future astronomy and astrophysics Explorers. Specific cost needs for an effective Explorer program are considered.

22834 Model atmospheres for K and M giants. Brown, J.A. (Indiana Univ., Bloomington (USA)); Johnson, H.R.; Cutright, L.C.; Alexander, D.R.; Sharp, C.M. *Astrophysical Journal, Supplement Series (USA),* 71: 623-646 (Nov 1989).

To aid in the interpretations of observations of K and M giant stars, model atmospheres have been calculated, covering the range in effective temperature between 3000 and 4000 K and in surface gravity-log g between 0.0 and 2.0. These models are computed under the usual assumptions of hydrostatic equilibrium, constancy of total (radiative plus convective) flux, and LTE in plane-parallel, horizontally homogeneous geometry. A significant development in these models is the incorporation of an opacity-sampled treatment of absorption by water vapor, which becomes dominant at lower temperatures. The thermal structure and scaling properties of the models are discussed, as are the effects of certain composition changes expected in the course of stellar evolution. 51 refs.

22835 Dynamics of flare-driven chromospheric condensations. Fisher, G.H. (Hawaii Univ., Honolulu (USA)). *Astrophysical Journal (USA),* 346: 1019-1029 (Nov 1989).

A general model of chromospheric condensation dynamics is developed under the assumption of sudden impulsive-phase flare energy release. The basic equation of motion for the downward-moving condensation is derived from the momentum equation and from general features seen in numerical simulations. This equation is solved for a number of different cases. The 'lifetime' of condensation and the time for the velocity to drop to half its peak value are computed. The peak downflow speed is examined as a function of the flare energy flux, and comparisons are made between downflow speeds predicted by both thick-target 'explosive evaporation' and evaporation driven conductively. 43 refs.

22836 (AD-A–212186/1/XAB) **Satellite observations of the O I 1304, 1356 and 1641 A dayglow and the abundance of atomic oxygen in the thermosphere.** Conway, R.R.; Meier, R.R.; Huffman, R.E. Air Force Geophysics Lab., Hanscom AFB, MA (USA). 1988. 12p. (GL-TR–89-0240). Available from NTIS, PC A03/MF A01.

Pub. in Planetary and Space Science, Vol. 36, No. 10, 963-973(1988).

The far ultraviolet spectrometer experiment on the S3-4 satellite made nadir-viewing observations of the atomic oxygen dayglow during the spring of 1978. Comparison of 27 orbits of OI 1304A (2p-3S), 1356 A (3p-3S), and 1641 A (1D-3S) intensities shows important orbit-to-orbit variations. For four selected orbits of data, airglow intensities were computed using the O abundance predicted by the MSIS-83 model atmosphere for the appropriate geophysical conditions. In general, the MIS-83 model atmosphere reproduces the airglow rather well. To match the absolute magnitude of the airglow, the computed photoelectron flux was increased by 40%, also the observed 1641/1304 intensity ratio required a branching ratio of 2.4×10^{-6}. Reductions in the airglow during geomagnetically disturbed conditions suggest decreases in the O concentration which can be observed remotely.

22837 (AD-A-214461/6/XAB) **Plasma transport through the dayside cleft: A source of ionization patches in the polar cap.** Foster, J.C. Massachusetts Inst. of Tech., Cambridge, MA (USA). 1989. 11p. Available from NTIS, PC A03/MF A01.

Pub. in Electromagnetic Coupling in the Polar Clefts and Caps, 343-354(1989).

Rapid sunward convection from the post-noon ionosphere carries high-density solar-produced F-region plasma through the dayside cleft and into the polar cap. This plasma is swept through the noontime cleft and enters the polar cap as a tongue of ionization which delineates the convection trajectory and its dynamics and provides the source for enhanced F-region plasmas and their effects which are observed at high polar latitudes away from noon.

22838 (AD-A-214541/5/XAB) **Two-dimensional mapping of dayside convection.** Foster, J.C.; Yeh, H.C.; Holt, J.M.; Evans, D.S. Massachusetts Inst. of Tech., Cambridge, MA (USA). 1989. 12p. Available from NTIS, PC A03/MF A01.

Pub. in Electromagnetic Coupling in the Polar Clefts and Caps, 115-125(1989).

Millstone Hill radar azimuth scans were used to map the large-scale features of the ionospheric convection pattern in the vicinity of the cusp and cleft. Each scan covers 5 hours of MLT and 20 deg of invariant latitude with 30 minute temporal resolution Individual snapshots of the convection pattern for disturbed conditions on 31 January 1982 span the entire region of convection convergence near noon and compare favorably with average model representations of the dayside region. The characteristic features of ion and electron precipitation observed during satellite overflights of the radar field of view are used to identify the cusp and cleft and to relate the location of these magnetospheric features to the pattern of ionospheric convection electric field. Cusp precipitation is seen at 70 deg lat. and 09 MLT at the sunward/anti-sunward convection reversal immediately after a sudden turning of interplanetary magnetic field (IMF) B sub y from -5 nT to +5 nT while IMF B sub z was -10 nT.

National Optical Astronomy Observatories, Tucson, AZ (USA). [1985]. 15p. Sponsored by U.S. DOE Nuclear Energy; National Science Foundation. DOE Contract AI06-82RL10355. Order Number DE90008472. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This research task consisted of obtaining spectra with the McMath telescope and Fourier transform spectrometer as part of a program funded by the Department of Energy to evaluate solar spectra as a source of data on atmospheric abundances.

22841 (RAL--89-086) **Magnetospheric plasma physics.** Bingham, R. Rutherford Appleton Lab., Chilton (UK). Sep 1989. 75p. Order Number DE90619481. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

The discovery of the earth's radiation belts in 1957 by Van Allen marked the beginning of what is now known as magnetospheric physics. In this study of plasma physics in the magnetosphere, we shall take the magnetosphere to be that part of the earth's ionized atmosphere which is formed by the interaction of the solar wind with the earth's dipole-like magnetic field. It extends from approximately 100km above the earth's surface where the proton-neutral atom collision frequency is equal to the proton gyrofrequency to about ten earth radii ($R_E \approx 6380$km) in the sunward direction and to several hundred earth radii in the anti-sunward direction. The collision dominated region is called the ionosphere and is sometimes considered separate from the collisionless plasma region. In the ionosphere ion-neutral collisions are dominant and one may think of the ionosphere as a frictional boundary layer $\approx$ 1000km thick. Other planets are also considered. (author).

22842 **Auroral breakup during substorm onsets.** Rothwell, P.L. (Air Force Geophysics Lab., Hanscom AFB, MA (USA)); Silevitch, M.B.; Falthammar, C.G. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184--: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The authors report their development of a model for auroral breakup that consists of two coupled circuits, one east-west, the other north-south that connect the ionosphere and the magnetosphere. It was found that narrow arcs formed at lower L-shells were the most unstable to poleward expansion. In this paper, they make the model more realistic by defining the magnetospheric electric field and current as produced by the dipolar collapse of the stretched magnetic field lines. They use the parameterized magnetic field model. Preliminary results indicate that the collapse of a moderately stretched field configuration over the period of a couple of minutes could induce a westward magnetospheric electric field of 2-10 mv/m at geosynchronous.

Availability: Document partially illegible.

Experts discussed recent research in high-brightness ion sources with possible applications of importance to DoD. Topics presented included: an overview of the definitions of fundamental concepts used to characterize ion beams; capillaritrons in which a gas at high pressure (several hundred torr) is forced through a conducting capillary kept at a potential of about 10 kV with respect to an annular anode – (Ions are produced from the plasma near the tip of the capillary by a process not completely understood); Liquid-Metal Ion (LMI) sources; Gas-phase field ion sources; Negative sources; Field-emission ion sources; Propagation of intense charge-neutral

ion beams in magnetic fields; Thermionic ion sources; and Sputtering.

22844 (AD-A–214983/9/XAB) **Radiative properties of UO^+. Technical report, 15 April 1988-15 April 1989.** Michels, H.H. United Technologies Research Center, East Hartford, CT (USA). 1 Dec 1989. 25p. Available from NTIS, PC A03/MF A01.

An analysis of the low-lying electronic states of UO(+) was undertaken. Oscillator strengths were calculated for thirteen (13) transitions: 1 4I-1 4K, 14I-3 4H, 1 4I-2 4H, 1 4I-1 4H, 1 4I-2 4I, 1 4I-1 6H, 1 4I-3 4I, 1 4H-2 4I, 1 4H-2 4H, 1 4H-1 4K, 1 4H-1 6H, 1 4H,-3 4H, and 1 4H-3 4I. Since the density of electronic states of UO^+ is large above 2.0 eV, we predict that strong solar pumping followed by both LWIR and visible radiation should occur for this system.

22845 (AD-A–215009/2/XAB) **Effect of correlation on the mean excitation energy of beryllium.** Sabin, J.R. Florida Univ., Gainesville, FL (USA). 1 Jun 1989. 8p. Available from NTIS, PC A02/MF A01.

Pub. in Physical Revies A, Vol. 39, No. 11, 5565-5571(1 Jun 1989).

Using the polarization-propagator formalism, the dipole-oscillator-strength distribution for Be has been calculated. Comparison of correlated with Hartree-Fock results shows that inclusion of correlation is very important for calculation of properties of the dipole-oscillator-strength distribution. In particular, IO is calculated to be 43.6 eV, some 12% higher than previously reported.

22846 (BNL–43835) **Density limitation on focusing of ground state cold H° beams.** Hershcovitch, A. Brookhaven National Lab., Upton, NY (USA). [1990]. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-900289–1: International workshop on the polarized ion sources and polarized gas jets, Tsukuba-Shi (Japan), 12-17 Feb 1990). Order Number DE90007673. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Based on recent experimental data regarding H°-H° scattering at low temperatures, limits on achievable $\vec{H}^\circ$ density are shown to be substantially lower than what was previously thought. Upper density limit due to the requirement that the mean free path in the spin selection magnet must exceed the magnet size is an order of magnitude lower as a consequence of much larger collisional cross sections than those previously assumed. Additionally, transit time effects set even lower limits on densities that can be practically reached with slow beams. 22 refs.

22847 (CEA-CONF–9460) **Barium atoms and N20 molecular agregates reaction.** Visticot, J.P.; Mestdagh, J.M.; Alcaraz, C.; Cuvellier, J.; Berlande, J. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Fondamentale (IRF). Jun 1988. 2p. (In French). (CONF-8806459–: 21. national colloquium on physics of atom and electron collisions, Caen (France), 21-24 Jun 1988). Order Number DE90756350. Available from NTIS (US Sales Only), PC A02/MF A01.

The collisions between a barium atom and N20 molecular agregates are studied, for a better understanding of the solvatation part in a chemical reaction. The experiments are carried out in a crossed molecular beam device. The light coming from the collision zone is scattered, and analysed by means of a photon detector. A time-of-flight technique is applied in the investigation of the beam's polymer concentration. The results show a nearly negligible chemiluminescent effect in the reaction between barium and N20 polymer. A solvated BaO formation mechanism is proposed to justify the experimental results.

22848 (CEA-CONF–9660) **Ionization and ions pair formation in $He(n^1P)$ thermal collisions in the Rydberg + molecules low states.** Pesnelle, A.; Ronge, C.; Perdrix, M.; Watel, G. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Fondamentale (IRF). Jun 1988. 2p. (In French). (CONF-8806459–: 21. national colloquium on physics of atom and electron collisions, Caen (France), 21-24 Jun 1988). Order Number DE90756352. Available from NTIS (US Sales Only), PC A02/MF A01.

The application limits of the free electron model are tested. Experiments on polar molecules and on molecules of high electronical affinity are effectuated. The experiments are carried out in a three crossed beam geometry: a $He(2^1S, 2^3S)$ metastable atom beam, a continuous and monomode laser UV beam (316 nm), and a gas target beam. The main results are: high cross sections are observed on NH3, SO2 and C3H6O; the σ"exp" behavior, as a function of v_r, is v_r^{-2}; a monotone σ"exp" (v_r) behavior is observed for SF6 and NO2. The experimental data can not be justified by means of the free electron model.

22849 (CEA-CONF–9661) **Production of autoionizing di-excited states at high angular momentum in Barium collisions with Xenon.** Roussel, F.; Breger, P.; Gounand, F.; Spiess, G. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Fondamentale (IRF). 1988. 2p. (In French). 22850 (CONF-8906270–4) **Born expansions for charged particle scattering.** Macek, J.H. (Tennessee Univ., Knoxville, TN (USA)); Barrachina, R.O. Oak Ridge National Lab., TN (USA). [1989]. 14p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Summer school of computational atomic and nuclear physics; Sewanee, TN (USA); 26 Jun - 7 jul 1989. Order Number DE90008491. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

High-order terms in Born expansions of scattering amplitudes in powers of charge are frequently divergent when long-range Coulomb interactions are present asymptotically. Expansions which are free from these logarithmic divergences have been constructed recently. We illustrate these expansions with the simplest example, namely the non-relativistic Rutherford scattering of two charged particles. This approach represents an adequate framework for the calculation of transition amplitudes and a comprehensive starting point for the development of consistent perturbation approximations in multi-channel descriptions of strongly interacting atomic systems. 17 refs.

22851 (INIS-mf–11522) **Atomic hydrogen in a magnetic trap.** Roijen, R. van. Amsterdam Univ. (Netherlands). 29 May 1989. 84p. Order Number DE90706036. Available from NTIS (US Sales Only), PC A05/MF A01; OSTI; INIS.

This thesis describes the construction and application of a static magnetic trap for atomic hydrogen. It is demonstrated that densities of up to $3*10^{14}$ cm $-^3$ at temperatures of 80 to 200 mK can be achieved with a technically simple method of filing the trap. Double polarization is shown to occur spontaneously in the trapped gas, and the dipolar relaxation rate and its field dependance are measured confirming theoretical predictions. These results show that atomic hydrogen is a promising material for the achievement of Bose-Einstein condensation provided that apart from the present method of cooling the gas, which is shown to impose a lower limit on the temperature, another cooling mechanism is supplied to reach lower temperatures. The density reached was two orders of magnitude higher than that of trapping experiments done at MIT where the technique of evaporate cooling was used to reach a temperature lower that 3 mK. 138 refs., 27 figs.

22852 (INIS-mf–11547) **Energy distribution in dissociations of polyatomic molecules.** Koernig, S.A. Amsterdam Univ. (Netherlands). 1 Sep 1989. 105p. Order Number DE90706039. Available from NTIS (US Sales Only), PC A06/MF A01; OSTI; INIS.

In this thesis studies are reported of fragmentation processes in polyatomic molecules. In order to find out which dissociation reactions take place, how are brought about by the internal energy of the reactant, and to investigate the structure of the dissociating "transition state", the fragment mass and the corresponding kinetic energy release (KER) are determined by differential translational

spectroscopy using a position and time sensitive two-particle coincidence detector. The results are interpreted using the statistical theory of unimolecular dissociation. It turns out that the standard assumptions of the theory, especially in calculating KER-distributions, are not realistic in all molecules considered. Dissociation is induced by the neutralization with alkali metal vapor. In Ch. 2 the experimental method and the analysis of the data (dissociation pathways, branching ratios and ε-d-distributions) are introduced and exemplified by measurements of cyclohexane, which represents the upper limit in precursor and fragment mass accessible in the apparatus. In Ch. 3 a study is reported of the molecules methylchloride (CH_3Cl) and the acetylradical (CH_3CO). In spite of their similar geometric structures, completely different dissociation mechanisms have been found. Methylchloride dissociates via a repulsive state; acetyl radicals show energy scrambling. The energy distribution from dissociating acetyl exemplifies dynamical effects in the dissociation. In Ch. 4 an investigation of a number of prototype hydrocarbons is presented. The dissociation pathways of several small linear alkanes indicate that neutralization takes place to unknown repulsive potentials, of which the position and steepness are determined from the kinetic energy release. 118 refs., 40 figs., 5 tabs.

22853 (INIS-mf–11548) **Stark effect in Rydberg states of helium and barium.** Lahaije, C.T.W. Vrije Univ., Amsterdam (Netherlands). 18 Jan 1989. 96p. Order Number DE90706040. Available from NTIS (US Sales Only), PC A05/MF A01; OSTI; INIS.

This thesis, which deals with the effect of an electric field up to moderate field strengths on atoms with two valence electrons outside closed shells, in casu helium and barium, contains chapter in which the linear Stark effect in the 1 snp ^{1,3}p Rydberg states of helium (n around 40) has been studied in a CW laser-atomic beam experiment. The evolution of the angular momentum manifolds into the n-mixing regime was followed and avoided level crossing were observed. Stark manifolds were also calculated by diagonalization of the complete energy matrix in the presence of an electric field. It turned out to be necessary to include up to five n-values in the calculations already at moderate values of the field to reproduce the data within the experimental accuracy (a few MHz), especially in the regime of the avoided crossings. 147 refs., 30 figs., 8 tabs.

22854 (JAERI-M–89-151) **Low energy ion generator: Performance results and tests irradiation.** Nakase, Yoshiaki (Japan Atomic Energy Research Inst., Neyagawa, Osaka (Japan). Osaka Lab. for Radiation Chemistry). Japan Atomic Energy Research Inst., Tokyo (Japan). Oct 1989. 75p. (In Japanese). Order Number DE90759905. Available from NTIS (US Sales Only), PC A04/MF A01.

In order to investigate the modification of polymer surface by ion bombardment, low energy ion generator has been constructed. In this report were described system design construction, generator components such as power system and evacuation system, the results of performance test. A maximum beam intensity of Kr^+ was 1.6 mA at 35 kV on a Ti-target. From the preliminary experimental results of Kr^+ irradiation, the coloration (carbonization) of the polymer surface, i.e. the increase of optical density, was observed. The relationship between the optical density change of irradiated polymer film and Kr^+ beam currents as measured by Faraday Cup will provide a convenient method to estimate absorbed ion energy in the film. (author).

22855 (LBL–28126) **Vibrational state-resolved differential cross sections for the D + H_2 → DH + H reaction.** Continetti, R.E. Lawrence Berkeley Lab., CA (USA). Nov 1989. 326p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE90008388. Available from NTIS, PC A15/MF A01; OSTI; INIS; GPO Dep.

In this thesis, crossed-molecular-beams studies of the reaction D + H_2 → DH + H at collision energies of 0.53 and 1.01 eV are reported. Chapter 1 provides a survey of important experimental and theoretical studies on the dynamics of the hydrogen exchange reaction. Chapter 2 discusses the development of the excimer-laser photolysis D atom beam source that was used in these studies and preliminary experiments on the D + H_2 reaction. In Chapter 3, the differential cross section measurements are presented and compared to recent theoretical predictions. The measured differential cross sections for rotationally excited DH products showed significant deviations from recent quantum scattering calculations, in the first detailed comparison of experimental and theoretical differential cross sections. These results indicate that further work on the H_3 potential energy surface, particularly the bending potential, is in order.

22856 (LBL–28206) **Infrared absorption study of zinc-doped silicon.** Merk, E.; Heyman, J.; Haller, E.E. Lawrence Berkeley Lab., CA (USA). Nov 1989. 7p. Sponsored by U.S. DOE Energy Research; National Science Foundation. DOE Contract AC03-76SF00098. Grant DMR-8806766. (CONF-891119–102: Materials Research Society fall meeting, Boston, MA (USA), 27 Nov - 2 dec 1989). Order Number DE90007779. Available from NTIS, PC A02/MF A01 - OSTI.

We report high resolution infrared absorption spectra associated with the deep zinc acceptor in silicon. The optical transitions between ground and bound excited "p-like" states of the neutral helium-like double acceptor Zn^0 center have been observed for the first time. The absorption cross section for the hole transition is found to be very small, of the order of 10^{-17} cm^2. Energy spacings of the $P_{3/2}$ Rydberg series are very similar to the spacings of the group-III acceptors, suggesting that, in spite of the large ground state binding energy, effective mass approximation still applies to the bound excited states. This represents one more case where the strong central cell potential does not significantly disturb the neutral helium-like bound excited states. Similar observations have been made for the less deep neutral double acceptor Be, and for the chalcogens donors S, Se and Te. The optical ionization energy of $Zn^{0/-}$ has been determined to be 2575 cm^{-1} (319 MeV). Two additional sets of absorption lines related to zinc have been observed at 2130 cm^{-1} and 2758 cm^{-1}. Their origin will be discussed. 15 refs., 5 figs., 1 tab.

22857 (PB–90-133158/XAB) **Center for Atomic, Molecular, and Optical Physics technical activities. 1989.** Gebbie, K.B. National Inst. of Standards and Technology (NML), Gaithersburg, MD (USA). Center for Atomic, Molecular and Optical Physics. Dec 1989. 364p. (NISTIR–89/4184). Available from NTIS, PC A16/MF A02.

See also PB–89-132302.

This report summarizes the research and technical activities of the Center for Atomic, Molecular and Optical Physics (CAMOP) during the Fiscal Year 1989. The activities include work in the areas of fundamental constants, radiation physics, surface science, molecular spectroscopy, electron and optical physics, atomic and plasma spectroscopy, time and frequency, quantum metrology, and quantum physics.

22858 (PNL–6100-Pt.4, pp. 15-17) **Target ionization by proton impact.** DuBois, R.D. Pacific Northwest Lab., Richland, WA (USA). Feb 1987. In *Pacific Northwest Laboratory: Annual report for 1986 to the DOE Office of Energy Research: Part 4, Physical sciences.* Order Number DE87010025. Available from NTIS, PC A04/MF A01.

A fundamental knowledge of the mechanisms by which radiation interacts with matter is essential to understanding dose-response relationships in terms of quantifiable chemical and physical processes. In our attempts to understand proton impact ionization of atomic and molecular targets, total ion (σ^+) and electron (σ^-) production cross sections, cross sections for multiple-target ionization ($\sigma^T q$) without regard to charge transfer and multiple-target ionization cross sections ($\sigma^{ij} q$) for direct ionization (i=j) and for charge transfer (j<i) have been measured. These cross sections have been combined with other information obtained from the literature to provide a total, consistent picture of target ionization resulting from proton impact. One of the aims of this effort is to show the relationship between the experimentally measurable quantities and the initial vacancy production mechanism.

22859 (PNL–6100-Pt.4, pp. 16-17) **Target ionization by helium ion impact.** DuBois, R.D. Pacific Northwest Lab., Richland, WA (USA). Feb 1987. In *Pacific Northwest Laboratory: Annual report for 1986 to the DOE Office of Energy Research: Part 4, Physical sciences.* Order Number DE87010025. Available from NTIS, PC A04/MF A01.

Projectiles arriving at the collision region with bound electrons of their own have been tested. Initial investigations have concentrated on He^+ impact in the study of both total ion and electron production and the amount of multiple ionization that occurs. Additional details at lower impact energies have been obtained for the direct ionization and the electron capture channels. It was shown that the predominant electron production mechanism for slow He^+ impact can be the multiple ionization channel; namely, electron capture plus one or more additional target ionizations. This was found to be even more important in the case of He^{2+} impact, where both the single and the double electron capture channels can contribute to the free electron production as effectively as does the direct ionization channel. These measurements were originally made for impact energies lower than 100 keV/atomic mass unit (amu), but in the case of He^+ impact measurements have now been extended to 500 keV/amu. At these higher impact energies, the importance of the electron capture channel is rapidly decreasing; however, the electron loss channels become very important.

22860 (PNL–6100-Pt.4, pp. 19-20) **Structured ion impact: Doubly differential cross sections.** DuBois, R.D. Pacific Northwest Lab., Richland, WA (USA). Feb 1987. In *Pacific Northwest Laboratory: Annual report for 1986 to the DOE Office of Energy Research: Part 4, Physical sciences.* Order Number DE87010025. Available from NTIS, PC A04/MF A01.

The electron emission in coincidence with a projectile that has been ionized has been measured, thus making it possible to separate and identify electrons resulting from these various mechanisms. In 1985, coincidence doubly differential cross sections were measured for 400 to 750 keV/atomic mass unit (amu) He^+ impact on He, Ne, Ar, Kr, and H_2O. Cross sections were measured for selected angles and for electron energies ranging from 10 to 1000 eV. Because of the coincidence mode of measurement, the total electron emission was subdivided into its target emission and its projectile emission components. The most interesting findings were that target ionization does not account for the electron emission spectrum at lower electron energies. A sizable percentage of these low-energy electrons were shown to originate as a result of simultaneous projectile/target ionizations. Similar features were observed for all targets and impact energies that were studied.

22861 (PNL–6100-Pt.4, pp. 25-26) **An analytic model for ionization distributions produced in nanometer sites by protons.** Wilson, W.E.; Paretzke, H.G. Pacific Northwest Lab., Richland, WA (USA). Feb 1987. In *Pacific Northwest Laboratory: Annual report for 1986 to the DOE Office of Energy Research: Part 4, Physical sciences.* Order Number DE87010025. Available from NTIS, PC A04/MF A01.

The initial spatial pattern of energy deposition by ionizing radiation plays a significant role in the subsequent evolution of biologically active chemical species. The study of track structure includes both theoretical and experimental investigation of the spatial pattern of energy deposition. The modeling of stochastic processes in the transfer of energy in macromolecular systems focused on understanding anisotropic radical yields observed in neutron irradiation of oriented deoxyribonucleic acid (DNA) fibers. Extensive computer simulations of proton tracks have been made for protons of energy E, passing through spherical sites of diameter d, off center by a distance b, which we call eccentricity. Computed ionization distributions for $0.3 < E < 20$ MeV, $2 < d < 1000$ nm, and $0 < b > d/2$ were obtained. The log normal function, $f(j) = EXP(-(\ln(j)-\mu)^2 / 2\sigma^2) / \sigma j (2\pi)$ is used to represent these distributions phenomenologically. A concise computer code system written in FORTRAN is under development to evaluate the model of the stochastics of ionization. For high-velocity charged particles and sufficiently small sites it is quite possible for the particle to pass through the site without depositing any energy or without ionization. This situation indicates a breakdown in the proportionality between fluence and dose, and it is therefore desirable to know how frequently this happens and, ideally, to be able to quantify the frequency. From the computer simulations it was discovered that in sites smaller than 1000 nm in diameter, the frequency for zero ionization is simply related to the cross sections for ionization, $f(j\text{-}O) = EXP[-d(1-b^2)^{\frac{1}{2}}/\lambda_j(E)_p]$ where j is the ionization number and λ_j is the mean free path for the interaction.

22862 (PNL–6100-Pt.4, pp. 28) **Track structure for 10- to 300-keV protons.** Wilson, W.E. Pacific Northwest Lab., Richland, WA (USA). Feb 1987. In *Pacific Northwest Laboratory: Annual report for 1986 to the DOE Office of Energy Research: Part 4, Physical sciences.* Order Number DE87010025. Available from NTIS, PC A04/MF A01.

Simulation of ion track structures has been extended down to an ion energy of 10 keV by developing algorithms for the charge-exchange cross sections and the accompanying delta-ray spectra. These results must be considered preliminary, however, because of the approximate nature of some of the code extensions. For the single differential cross section (SDCS) for delta-ray emission, use of a hydrogenic approximation by Professor M.E. Rudd has been made. The Rudd algorithm is for low-energy ion-induced delta-ray emission from hydrogen rather than water. It is used to estimate emission from each valence shell of water vapor by allowing for the different binding energies, and then sum the shells to get a total for the eight valence electrons in the molecule. This procedure produces an ion stopping power that is about 25% too large around 50 to 100 keV, decreasing on each side of this to become 5% to 10% too small at 10 and 300 keV. More interactions occur on the average within a given site size than occur for higher-energy ions; larger mean values produce more symmetric Gaussian-like distributions.

22863 (PNL–6100-Pt.4, pp. 28-29) **Microscopic track structure of equal linear-energy-transfer heavy ions.** Wilson, W.E.; Criswell, T.L. Pacific Northwest Lab., Richland, WA (USA). Feb 1987. In *Pacific Northwest Laboratory: Annual report for 1986 to the DOE Office of Energy Research: Part 4, Physical sciences.* Order Number DE87010025. Available from NTIS, PC A04/MF A01.

The spatial distributions of ionization and energy deposition produced by heavy (HZE) ions are crucial to an understanding of their radiation quality as exhibited, for example, in track segment experiments of cell survival and chromosome aberrations of mammalian cells. The stopping power, or linear energy transfer (LET), of a high-velocity ion is proportional to the ratio Z**2/v**2, where Z and v are the atomic number and velocity, respectively, of the moving ion, apart from a slowly varying logarithmic factor. The maximum delta-ray energy that an ion can produce is proportional to v**2 (nonrelativistically). Therefore, two HZE ions having the same LET, but in general different Z and v, will have different maximum delta-ray energies and consequently will produce different spatial patterns of energy deposition along their paths.

22864 (UCID–21792) **Modelling Doppler broadening in Raman propagation.** Sacks, R. Lawrence Livermore National Lab., CA (USA). 28 Feb 1990. 5p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90008042. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

In December 1986, Karr described an elegant treatment for inhomogeneous broadening of Raman lines, within the context of an integral formulation of the Bloch equation. This formulation relied, for important simplifications, on the assumptions that the molecular population inversion be independent of velocity and that the velocity distribution be Maxwellian. Here we derive an alternative description — a truncated velocity moment series for the differential Liouville equation.

22865 (UCID–21873) **L shell XANES [x-ray absorption near edge structure] for solid metals: Ti, V, Cr, Fe, Ni, Cu.** Del Grande, N.K. Lawrence Livermore National Lab., CA (USA). Jan 1990. 4p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90008043. Available from NTIS, PC A02/MF A01 - OSTI.

The L shell x-ray absorption near edge structure (XANES) for the 3d transition metals Ca-Cu is dominated by atomic-like behavior which is poorly understood. It has been studied by electron energy loss spectroscopy (EELS) and bremsstrahlung isochromat spectra (BIS). More and better photoabsorption cross-section measurements are needed over the sparsely studied 400–1500 eV region to test theoretical methodologies which fuse atomic and condensed matter theories. Progress has been made reporting absolute photoabsorption cross sections taken with the spherical grating monochromator on beamline 8-2 at SSRL in 1989.

22866 (UCID–21918) **Tables of average distributions of particles emitted by ionized elements (Z = 6–100).** Lee, P.; Rathkopf, J.; Cullen, D.; Perkins, S. Lawrence Livermore National Lab., CA (USA). Jan 1990. 70p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90008144. Available from NTIS, PC A04/MF A01; OSTI; INIS; GPO Dep.

Tables giving the average division of energy between electrons and x-rays emitted by singly ionized elements undergoing bound-bound transitions are provided. The expected number of particles is also given. This data is tabulated by atomic number and subshell of initial vacancy. A description of the method of calculation is also presented. 2 refs., 1 fig., 1 tab.

22867 (UCRL–53901) **The time dependent Hartree-Fock calculation of ion-molecule scattering.** Tiszauer, D.H. Lawrence Livermore National Lab., CA (USA). 30 Dec 1988. 180p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90008323. Available from NTIS, PC A09/MF A01 - OSTI.

Thesis. Submitted to Univ. of California, Davis.

An alternative semiclassical method of handling reactive molecular collisions that involve charge exchange or electronic transitions is presented. A means of time propagating the electronic wave function and time propagating the classical equations of motion for the nuclei through the collision in a self-consistent fashion is developed by use of the time-dependent Hartree Fock (TDHF) method. This replaces the traditional semiclassical two-step approach which requires a calculation of the electronic potential energy surfaces and then solves for the classical nuclear motion on these surfaces. It is shown that the self-consistent propagation of the electronic wave function and the classical nuclear motion implicity includes the nuclei-electronic coupling that is normally ignored in the Born-Oppenheimer approximation. The coupling included is responsible for nonadiabatic electronic transitions encountered in molecular collisions. The TDHF method is tested on a model collision of H_2+H^+ in the low energy (2 eV) regime. The program used in the computations was adapted from previous nuclear and atomic TDHF calculations, and was implemented on a vector machine. Results of the calculation qualitatively compare to the known results for the H_2+H^+ reactive system showing reaction, electronic transition, and translational to vibrational energy transfer. Developments in computational single-processor speed, the greater availability of vector and array processors, and the simplicity of graphical representation of TDHF results promises to make the molecular TDHF approach a very viable tool for the study of reactive molecular scattering.

22868 In situ x-ray scattering of monolayers adsorbed at electrochemical interfaces. Toney, M.F. (IBM Research Div., Almaden Research Center, San Jose, CA (US)); Melroy, O.R. pp. 304 of Synchrotron radiation in materials research. Clark, R.; Gland, J.; Weaver, J.H. Materials Research Society, Pittsburgh, PA (1989). (CONF-8811224–: Synchrotron radiation in materials research, Boston, MA (USA), 28-30 Nov 1988).

Surface x-ray scattering has been used to study in-situ the structure of Pb monolayers electrochemically adsorbed on Ag (111) electrodes. Pb forms an incommensurate, hexagonal two-dimensional (2D) solid, which is rotated approximately 4.5^0 from the substrate symmetry directions and compressed relative to bulk Pb. Between monolayer formation and bulk deposition, the Pb-Pb near neighbor distance decreases linearly with applied potential. Due to the chemical equilibrium between the Pb monolayer and the Pb in solution, the isothermal compressibility of the monolayer can be measured and is in good agreement with that calculated for a 2D non-interacting free electron gas model of the monolayer. It is observed that the intensity of surface diffraction from the Ag substrate (the Ag crystal truncation rod) decreases when the Pb monolayer is adsorbed, although the cause of this is not known.

22869 Bonding in thin epitaxial $CoSi_2$ films on Si(100). Chambliss, D.B. (School of Applied and Engineering Physics, Cornell Univ., Ithaca, NY (US)); Rhodin, T.N.; Rowe, J.E.; Yalisove, S.M. pp. 304 of Synchrotron radiation in materials research. Clark, R.; Gland, J.; Weaver, J.H. Materials Research Society, Pittsburgh, PA (1989). (CONF-8811224–: Synchrotron radiation in materials research, Boston, MA (USA), 28-30 Nov 1988).

Epitaxy of $CoSi_2$ layers on Si crystal surfaces can be strongly influenced by growing appropriate template layers. The authors report the electronic structure of thin epitaxial $CoSi_2$ on Si(100) studied with angle-resolved photoemission to investigate atomic bonding in the layers and at their boundaries. Most Co atoms in the layers are in a $CoSi_2$-like environment, including those Co atoms near the free surface. Cobalt atoms at the Si-$CoSi_2$ interface seem to have fewer Si neighbors.

22870 Valence band electronic structure of cleaved iron oxide single crystals studied by resonant photoemission. Lad, R.J. (Applied Physics, Yale Univ., New Haven, CT (US)); Henrich, V.E. pp. 304 of Synchrotron radiation in materials research. Clark, R.; Gland, J.; Weaver, J.H. Materials Research Society, Pittsburgh, PA (1989). (CONF-8811224–: Synchrotron radiation in materials research, Boston, MA (USA), 28-30 Nov 1988).

The authors report synchrotron radiation used to perform resonant photoemission measurements across the 3p–3d photoabsorption threshold from cleaved Fe_xO ($x \simeq 0.945$), Fe_3O_4, and α-Fe_2O_3 single crystal surfaces. The resonant enhancement of the Fe 3d photoelectrons allows the Fe 3d-derived final states in the valence band to be distinguished from the overlapping O 2p states. Using well-characterized single crystals, the distributions of Fe 3d-derived states associated with the ferrous (Fe^{2+}) and ferric (Fe^{3+}) cations have been identified. The Fe 3d-derived states are found to extend about 18 eV below the Fermi level in each oxide, which can be attributed to a significant amount of hybridization between the Fe 3d and O 2p orbitals.

22871 Bond selective chemistry with photon-stimulated desorption. Yarmoff, J.A. (National Institute of Standards and Technology, Surface Science Div., Gaithersburg, MD (US)); Joyce, S.A. pp. 304 of Synchrotron radiation in materials research. Clark, R.; Gland, J.; Weaver, J.H. Materials Research Society, Pittsburgh, PA (1989). (CONF-8811224–: Synchrotron radiation in materials research, Boston, MA (USA), 28-30 Nov 1988).

The authors report on the photon stimulation desorption of fluorine ions from silicon surfaces studied via excitation of the Si 2p core level with synchrotron radiation. These results show that the process is chemically selective in that the removal of a fluorine ion from a silicon species in a given oxidation state can be enhanced by tuning the photon energy to the excitation wavelength corresponding to a transition from the 2p core level of the bonding atom to the conduction band minimum. This process was studied as a possible means for the production of surfaces with selected compositions of species. The results of selective exposure of fluorinated surfaces to monochromatized radiation indicate that secondary desorption processes and the inherent chemistry of the surface reactions can override the effects of selective desorption. Other possibilities for selective surface reactions via core-level excitations are discussed.

22872 The recoil proton polarization in πp elastic scattering. Seftor, C.J. Thesis (Ph. D.). 196p. George Washington Univ., Washington, DC (US) (1988). Available from University Microfilms, PO Box 1764, Ann Arbor, MI 48106, Order No.89-00,504.

The polarization of the recoil proton for π^+p and π^-p elastic scattering has been measured for various angles at 547 MeV/c and 625 MeV/c in a collaborative experiment involving participants from the George Washington University: the University of California, Los Angeles; and Abilene Christian University. The experiment was performed at the P^3 East experimental area of the Los Alamos Meson Physics Facility. Beam intensities varied from 0.4 to 1.0 x 10^7 π^- s/sec and from 3.0 to 10.0 x 10^7 π^+ s/sec. The size of the beam spot at the target was 1 cm in the horizontal direction by 2.5 cm in the vertical direction. A liquid-hydrogen target was used in a flask 5.7 cm in diameter and 10 cm high. The scattered pion and recoil proton were detected in coincidence using the large acceptance spectrometer (LAS) to detect and analyze the momentum of the pions and the JANUS recoil polarimeter to detect and measure the polarization of the protons. Results from this experiment are compared to analyzing power data previously taken by this group and to partial-wave analysis predictions.

22873 Nuclear spectroscopy of neutron-rich odd-A N = 61 isotones in the deformed A ≈ 100 region. Goulden, J.D. Thesis

(Ph. D.). 234p. Univ. of Oklahoma, Norman, OK (US) (1988). Available from University Microfilms, PO Box 1764, Ann Arbor, MI 48106, Order No.89-04,355.

The level structures of ^{99}Sr and ^{101}Zr have been studied through the β-decay of their parents ^{99}Rb and ^{101}Y, which were produced through the thermal neutron fission of ^{235}U at the Isotope Separator On-Line TRISTAN, Brookhaven National Laboratories. In ^{99}Sr, 72 γ rays are placed in a level scheme containing 27 levels, and in ^{101}Zr, 97 γ rays are placed in 37 levels. The rotational structure of both nuclei indicates an axially symmetric deformation in the range $0.20 < \gamma < 0.30$. The ground-state band of each is associated with the 3/2[411] Nilsson single-particle orbital. In ^{99}Sr, eight additional levels below 1200 keV are tentatively associated with rotational bands constructed on the 3/2[541], 5/2[413], and 5/2[532] Nilsson orbitals. In ^{101}Zr, six additional levels may be associated with bands constructed on spin-1/2, 3/2, and 5/2 levels. Similarities and differences in the structure of the two N = 61 isotones are discussed, as are similarities with the nearby odd-proton nuclei ^{99}Y and ^{101}Y.

22874 (PB–90-856121/XAB) **Computational fluid dynamics: Complex flows requiring supercomputers. January 1975-December 1989 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for January 1975-December 1989.** National Technical Information Service, Springfield, VA (USA). Jan 1990. 83p. Available from NTISPC N01/MF N01.

Supersedes PB–88-867965.

This bibliography contains citations concerning computational fluid dynamics (CFD), a new method in computational science to perform complex flow simulations in three dimensions. Applications include aerodynamic design and analysis for aircraft, rockets and missiles, and automobiles; heat-transfer studies; and combustion processes. Included are references to supercomputers, array processors, and parallel processors where needed for complete, integrated design. Also included are software packages and grid-generation techniques required to apply CFD numerical solutions. Numerical methods for fluid dynamics, not requiring supercomputers, are found in a separate Published Search. (This updated bibliography contains 132 citations, 49 of which are new entries to the previous edition.)

22875 (SAND–89-3040C) **A simple multicomponent fluid theory with accurate physics.** Passman, S.L. (Department of Energy, Pittsburgh, PA (USA). Pittsburgh Energy Technology Center); Drew, D.A. Sandia National Labs., Albuquerque, NM (USA). 24 Jan 1990. 10p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-9005108–1: Symposium on structured continua, Sherbrooke (Canada), 22-25 May 1990). Order Number DE90006537. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Generally multicomponent mixtures can exhibit a rich collection of phenomena. Thus it is to be expected that they will be described by complicated theories. In this paper we describe a relatively simple theory that is still theoretically correct, and discuss some of the phenomena that it exhibits. 12 refs.

22876 (UCRL–99707) **Domain decomposition for a boundary-value problem with a shock layer.** Hedstrom, G.W. (Lawrence Livermore National Lab., CA (USA)); Howes, F.A. Lawrence Livermore National Lab., CA (USA). Mar 1989. 14p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8903169–3: 3. Society for Industrial and Applied Mathematics (SIAM) conference on domain decomposition methods, Houston, TX (USA), 20-22 Mar 1989). Order Number DE90007857. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We propose a domain decomposition method for a singularly perturbed elliptic partial differential equation for problems in which the solution has a shock layer interior to the domain. This method is designed for situations in which it is desired to resolve the behavior within the shock layer. 11 refs., 2 figs.

22877 **Vortex lattices in theory and practice.** Campbell, L.J. (New York Univ., NY (USA)). pp. 229 of Mathematical aspects of vortex dynamics; Proceedings of the Workshop, Leesburg, VA, Apr. 25-27, 1988. Caflisch, R.E. Society for Industrial and Applied Mathematics, Philadelphia, PA (US) (1989). (CONF-8804320–: Workshop on mathematical aspects of vortex dynamics, Leesburg, VA (USA), 25-27 Apr 1988).

Infinite, twofold periodic vortex arrays are studied. An expression for the energy density of an arbitrary vortex lattice is discussed. For the case of two vortices per unit cell, the morphology of stable lattices can be described completely. A nontrivial physical realization of such lattices is a rotating mixture of He-3 and He-4 at temperatures so low that both isotopic components are superfluid. The structure of the expected lattices is quite different from the usual triangular structure. Magnetic flux lines in high-temperature superconductors show a one-parameter family of degenerate ground states of lattice due to the anisotropy of the vortex-vortex interaction. The case of vortices confined to a grid is also discussed. 11 refs.

22878 **Development of a numerical method for full solution of magnetohydrodynamic flows and application to fusion blankets.** Kim, C.N. Thesis (Ph. D.). 146p. Univ. of California, Los Angeles, CA (US) (1989). Available from University Microfilms, PO Box 1764, Ann Arbor, MI 48106, Order No.89-09,408.

A numerical algorithm was developed to predict the characteristics of the flow field in liquid-metal magnetohydrodynamic (MHD) flow with a relatively large Hartmann number and interaction parameter. Using this algorithm, steady-state, incompressible, viscous, 3-dimensional MHD flow under various flow conditions was investigated at an extremely low magnetic Reynolds number by means of the finite-volume method. A differential form of a Poisson-type pressure equation is used to incorporate the effect of magnetic force on the pressure field in liquid-metal MHD flow. The primary variables are solved in a split manner as a predictor step, and these variables are then corrected as a corrector step to satisfy the global and local conservations. The use of the control-volume approach enables the implementation of a corrector step, which contributes to convergence and physical accuracy. The basic algorithm and the numerical scheme developed were successful in solving 3-dimensional problems at a relatively large interaction parameter, which is of considerable interest in fusion-reactor applications. Numerical results for liquid metal MHD flows under different flow conditions are presented.

22879 (DOE/ER/40366–2) **[Research in high energy physics]: Annual report, 1988–1989.** LoSecco, J. Notre Dame Univ., IN (USA). Dept. of Physics. [1989]. 23p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-87ER40366. Order Number DE90007751. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

We review the efforts of the Notre Dame non accelerator high energy physics group. Our major effort has been directed toward the IMB deep underground detector. Since the departure of the Michigan group our responsibilities to the group have grown. We are also very active in pursuing physics with the IMB 3 detector. Currently we are studying proton decay, point neutrino sources and neutrino oscillations with the contained event sample.

22880 (LBL–91-Rev.-9/89) **Current experiments in elementary particle physics.** Wohl, C.G. (Lawrence Berkeley Lab., CA (USA)); Armstrong, F.E.; Trippe, T.G.; Yost, G.P.; Oyanagi, Y.; Dodder, D.C.; Ryabov, Yu.G.; Slabospitsky, S.R.; Frosch, R.; Olin, A. Lawrence Berkeley Lab., CA (USA). Sep 1989. 179p. Sponsored by U.S. DOE Energy Research; National Science Foundation. DOE Contract AC03-76SF00098. Order Number DE90008062. Available from NTIS, PC A09/MF A01; OSTI; INIS; GPO Dep.

This report contains summaries of 736 current and recent experiments in elementary particle physics (experiments that finished taking data before 1982 are excluded). Included are experiments at

Brookhaven, CERN, CESR, DESY, Fermilab, Tokyo Institute of Nuclear Studies, Moscow Institute of Theoretical and Experimental Physics, Joint Institute for Nuclear Research (Dubna), KEK, LAMPF, Novosibirsk, PSI/SIN, Saclay, Serpukhov, SLAC, and TRIUMF, and also several underground experiments. Also given are instructions for searching online the computer database (maintained under the SLAC/SPIRES system) that contains the summaries. Properties of the fixed-target beams at most of the laboratories are summarized.

6451 Particle Interactions and Properties - Experimental

22881 (CEA-CONF–9797) **Electro and photoproduction of strangeness.** Bertini, R. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service de Physique Nucleaire a Moyenne Energie. 1988. 31p. (CONF-8806236–: 1. European workshop on hadronic physics in the 1990's with multi-GeV electrons, Seillac (France), 27 Jun - 1 jul 1988). Order Number DE90756436. Available from NTIS (US Sales Only), PC A03/MF A01.

Strangeness-production studies and the characteristics of the electron accelerators applied in the experiments are discussed. The strangeness of the nucleon, the polarization in hyperon production, strange dybaryons, hypernuclei and baryons resonance and strangeness are the main topics. The importance of the electromagnetic probe as a tool in hyperon polarization measurements, in order to understand why hyperons become polarized at large momentum transfer, is underlined. High beam energies (30 GeV or so) and targets are needed for the study of the nucleon spin functions, as well as transverse and longitudinal polarization of the beam must be provided. In the following studies the needed energy range has been determinated: for the study of the strangeness content of the nucleon a beam energy higher than 3-4 GeV, in the search of H and D baryons, energies higher than 4 GeV, for the production of hypernuclei, the hyperon polarization and the baryon resonances study, beam energies ranging in the 3-4 GeV gap are enough. The relation meson-nucleon sigma terms to the strange quark content of the nucleon is discussed. In the measurement of the K-N sigma term, low energy Kaon beams and, possibly, polarized targets are needed.

22882 (DOE/ER/40368–3) **Studies of high energy phenomena using muons: Progress report.** Hedin, D.; Kaplan, D.; Green, J. Northern Illinois Univ., Dekalb, IL (USA). 1990. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-87ER40368. Order Number DE90008272. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This report covers the activities of the NIU high energy physics group as supported by DOE contact AC02-87ER40368 during the period from March of 1989 to February of 1990. Our group has two primary efforts. The first is the D0 experiment at the Fermilab proton-antiproton collider, with major emphasis on its muon system. The second is the involvement of a precision study of the A-dependence of massive muon-pion production and a study of low-multiplicity decay modes of charm. We are also participating in the design of detectors for the SSC. Finally, a minor effort is being given to analyzing data from Fermilab of particles with lifetime between 10^{-12} and 10^{-13} seconds. A more detailed description of the work of the NIU high energy physics group can be found in the narrative accompanying our grant renewal proposal. 10 refs.

22883 (FNAL/C–90/39) **High luminosity muon scattering at FNAL.** Bazizi, K. (California Univ., Riverside, CA (USA)); Conrad, J.; Fang, G.; Erdmann, M.; Geesaman, D.; Jackson, H.; Guyot, C.; Virchaux, M.; Holmgren, H.; Malensek, A. Fermi National Accelerator Lab., Batavia, IL (USA). Feb 1990. 30p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-890872–6: Workshop on physics at Fermilab in the 1990's, Breckenridge, CO (USA), 15-24 Aug 1989). Order Number DE90008779. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The charge of this group was to evaluate the physics that can be done with a high luminosity μ scattering experiment at FNAL using the upgraded Tevatron muon beam, and consider the apparatus required. In this report, the physics that can be accomplished with a high luminosity μ scattering experiment is evaluated. The CERN and FNAL μ beams are compared in the context of such an experiment. The expected muon flux with the upgraded machine is estimated. Two possible detectors are compared: the air-core toroid experiment proposed by Guyot et al., and an upgraded version of the E665 double-diode apparatus now in place at FNAL. The relative costs of the detectors are considered. A list of detailed questions that need to be answered regarding the double-diode experiment has be compiled. 2 refs., 10 figs., 2 tabs.

22884 (IPNO-T–89-07) **J/ψ production and the di-muons in oxygen-copper collisions at 200 GeV/nucleon.** Sinquin, A. Paris-11 Univ., 91 - Orsay (France). Jul 1988. 98p. (In French). Order Number DE90756357. Available from NTIS (US Sales Only), PC A05/MF A01.

The oxygen on copper collisions are studied. The aim of the study is the analysis of the J-ψ production at lower energy densities. No discontinuity is observed in the decrease of the ratio R. The R value is the same than for oxygen-uranium collisions, provided the energy density is the same. This effect is not explained, up to now, by classical models (J/ψ absorption in the nucleus it self or in the pion cloud produced in the collision). Ultrarelativistic oxygen beams at 200 GeV/N and very high intensity are applied to provide high energy densities. In these conditions a phase transition from a hadronic phase, to a plasma of deconfined quarks and gluons, can be obtained. For oxygen-uranium collisions, a decrease of the ratio R of the number of J/ψ to the number of continuum dimuons with transverse energy, is observed. These results are in agreement with the predictions of the quarks and gluons plasma models.

22885 (Juel–2296) **Measurement of double differential production cross sections for charged particles for the validation of theoretical models used to describe interactions of high energy protons with matter.** Koch, K.M. Kernforschungsanlage Juelich GmbH (Germany, F.R.). Inst. fuer Reaktorentwicklung; Technische Hochschule Aachen (Germany, F.R.). Aug 1989. 122p. (In German). Available from Kernforschungsanlage Juelich GmbH (Germany, F.R.). Zentralbibliothek. Available from Kernforschungsanlage Juelich GmbH (Germany, F.R.). Zentralbibliothek.

Following the increasing interest in reaction data for the medium energy region, the production of light charged particles (A<10) induced by 800 MeV protons was measured at the Los Alamos National Laboratory. The particles were generated on ultra-thin Pb-, Cu-, Al- and C-targets and viewed under 38deg C by a 12,3 m long vacuum time-of-flight telescope employing a detector sandwich consisting of four silicon-surface-barrier detectors and one plastic Pilont B scintillator. A E-, ΔE- and time-of-flight based analysis algorithm made it possible to separate protons (2-65 MeV), deuterons (3-100 MeV), tritons (5-120 MeV), He-3 particles (5-220 MeV), He-4 particles (5-220 MeV) and particles with masses 6, 7, 8 and 9 (4-30 MeV) with an energy resolution better than 2.5% The data were reduced to double differential production cross sections with special considerations on target self absorptions, scattering effects and background corrections. The overall accuracy of the measurement is primary due to counting statistics, absolute proton intensity estimation and target thickness variations from 18 to 29%. The results are in good agreement with other experimental data and were compared with calculations, done by the KFA-HERMES code system using the intranuclear cascade- and evaporation model. (orig.).

22887 (LAL–88-11) **Measurement of the reaction $e^+e^- \rightarrow \eta \pi^+ \pi^-$ in the center of mass energy interval 1350-2400 MeV.** DM2 Collaboration. DM2 Collaboration. Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire. May 1988. 15p. Order Number DE90756406. Available from NTIS (US Sales Only), PC A03/MF A01.

The $e^+e^- \rightarrow \eta \pi^+ \pi^-$ reaction has been measured in the center of mass energy interval 1350-2400 MeV by the magnetic detector DM2 at the Orsay storage ring DCI. Under the hypothesis of only one large resonance the cross section is not fit in a satisfactory way. The branching ratio $\tau^- \rightarrow \eta \pi^- \pi^0 \nu_\tau = (0.13 \pm 0.02)\%$ is deduced via CVC from the above measurement.

22888 (LAL–88-12) **First observation of three pseudoscalar states in the $J/\Psi \rightarrow \gamma \rho \rho$ decay.** DM2 Collaboration. DM2 Collaboration. Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire. Jun 1988. 25p. Order Number DE90756407. Available from NTIS (US Sales Only), PC A03/MF A01.

The $J/\Psi \rightarrow \gamma \pi^+ \pi^- \pi^+ \pi^-$ and $J/\Psi \rightarrow \gamma \pi^+ \pi^- \pi^0 \pi^0$ decays have been studied by the DM2 experiment from 8.6 million J/Ψ. Both decays exhibit a large pseudoscalar $\rho \rho$ dynamics. Three $J^{PC} = 0^{-+}$ resonant states (more than 3500 events, globally) decaying into $\rho^0 \rho^0$ and with less statistical significance into $\rho^+ \rho^-$ are observed. Their branching ratios into $\rho^0 \rho^0$ and $\rho^+ \rho^-$ support an $I^G = 0^+$ assignment. These states, named η (1500), η (1800) and η (2100), are not associated with well established resonances and do not fit in the standard q antiq scheme.

22889 (LAL–88-13) **Looking at CP invariance and quantum mechanics in $J/\Psi \rightarrow \Lambda\text{anti}\Lambda$ decay.** DM2 Collaboration. DM2 Collaboration. Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire. May 1988. 14p. Order Number DE90756455. Available from NTIS (US Sales Only), PC A03/MF A01.

The $J/\Psi \rightarrow \Lambda\text{anti}\Lambda \rightarrow p\pi^-\text{antip}\pi^+$ decay is used to test the CP invariance in the Λ hyperon decays by measuring $A = (\alpha_\Lambda + \alpha_{\text{anti}\Lambda})/(\alpha_\Lambda - \alpha_{\text{anti}\Lambda})$ where α_Λ ($\alpha_{\text{anti}\Lambda}$) is the decay asymmetry parameter of the Λ(antiΛ). The obtained value $A = 0.01 \pm 0.10$ is in agreement with CP invariance. The used formalism would permit to check Quantum Mechanics, assuming CP invariance.

22890 (LAL–88-47) **The pion electromagnetic form factor in the time-like energy range $1.35 \leq \sqrt{s} \leq 2.4$ GeV.** DM2 Collaboration. DM2 Collaboration. Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire. Oct 1988. 15p. Order Number DE90756415. Available from NTIS (US Sales Only), PC A03/MF A01.

The $e^+e^- \rightarrow \pi^+\pi^-$ cross section has been measured from about 280 events (an order of magnitude more than the previous world statistics) in the energy interval $1.35 \leq \sqrt{s} \leq 2.4$ GeV with the DM2 detector at DCI. The pion squared form factor shows a deep minimum around 1.6 GeV/c^2 and is best fit under the hypothesis of two ρ like resonances $\simeq$ 0.2 GeV/c^2 wide with 1.43 and 1.76 GeV/c^2 masses.

22891 (LAL–88-61) **An experimental study of e^+e^- annihilation into four leptons at $\sqrt{S} \geq 35$ GeV.** CELLO Collaboration. CELLO Collaboration. Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire. Dec 1988. 21p. (DESY–88-192). Order Number DE90756443. Available from NTIS (US Sales Only), PC A03/MF A01.

The three reactions $e^+e^- \rightarrow e^+e^-e^+e^-$, $e^+e^- \rightarrow e^+e^- \mu^+\mu^-$ and $e^+e^- \rightarrow \mu^+ \mu^- \mu^+ \mu^-$ have been studied using the CELLO detector at PETRA. The data correspond to 130 pb^{-1} collected at energies ranging from 35 GeV to 46.8 GeV. A detailed analysis of the distribution of the observed events in phase space shows good agreement with QED to order α^4.

22892 (LBL–28112) **Recent results on jet physics and tests of QCD [Quantum Chromodynamics] in e^+e^- annihilation.** Bethke, S. Lawrence Berkeley Lab., CA (USA). Nov 1989. 23p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8906294–1: Workshop on the standard model at present and future accelerator energies, Budapest (Hungary), 27 Jun - 21 jul 1989). Order Number DE90007757. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Experimental investigations to test specific predictions of Quantum Chromodynamics and to adjust the free parameters of the theory are reviewed. Determinations of the strong coupling constant, α_s, in Υ-decays and in the continuum of e^+e^- annihilations are summarized and discussed. Studies on production rates of multijet hadronic final states in the center of mass energy range of 22 GeV to 93 GeV, including optimizations of both the scale parameter $\Lambda_{\overline{MS}}$ and the renormalization scale μ^2 in $O(\alpha_s^2)$ perturbative QCD, are presented. The status of experimental tests of the nonabelian nature of QCD is summarized. 48 refs., 9 figs., 4 tabs.

22893 (LBL–28196) **Measurements of e^+e^- pair production at the Bevalac.** Carroll, J. (California Univ., Los Angeles, CA (USA). Dept. of Physics). Lawrence Berkeley Lab., CA (USA). Feb 1989. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098;AS03-81ER40027. (CONF-8902107–1: School on nuclear matter and heavy ion collisions, Les Houches (France), 7-16 Feb 1989). Order Number DE90008495. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A complete kinematic description of a lepton pair requires 6 independent variables, in contrast to the case of a real photon, where there are only 3 independent variables. The mass and momentum of the virtual photon may be specified independently, with the remaining variables being the two angles specifying its production direction, and the two angles of the decay in its rest frame. It has become customary to use as kinetics variables: the mass, M; the transverse momentum, P_t; and a longitudinal variable, either the rapidity – Y, or the scaling variable – X. Data are almost always presented as a function of only one of these variables. This may be due to the difficulty inherent in presenting multidimensional data, to poor statistics, to limited experimental acceptance, or to some combination of these reasons. It should be noted, however, that these one-dimensional projections always represent integrations over the remaining variables – integrations within which the shape and limits of the acceptance of the experimental apparatus must be taken into account. The effects of the acceptance must be understood in comparing experimental data either to theory or to results from experiments with different coverage of the total phase space. Although we have a strong interest in studying nucleus-nucleus collisions using the tool, most of the discussion presented here will be about our measurements in p+Be collisions. It was necessary for us to make these measurements because, in the relevant range of incident energies, the yield of electron pairs from nucleon-nucleon collisions had not been measured, nor was the hadronic production mechanism understood. A brief discussion of lepton production in hadronic collision will help put out our results in a proper framework. 15 refs., 9 figs., 2 tabs.

22894 (LPNHEP–88-11) **Neutrino oscillations at accelerators.** Bernardi, G. Paris-6 Univ., 75 (France). Lab. de Physique Nucleaire et de Hautes Energies. 1988. 7p. (CONF-880867–: 24. international Rochester conference on high energy physics, Munich (Germany, F.R.), 4-10 Aug 1988). Order Number DE90756362. Available from NTIS (US Sales Only), PC A02/MF A01.

The neutrino oscillation experiments at accelerators are reviewed. Special attention is given to the neutrino mass measurement. The experimental results show that, at present, there is no indication for neutrino oscillations. Neutrino experiments which improve the $\nu_e/\nu.\mu$ knowledge, and which increase the number of neutrino interactions, are needed. With technical developments and the improvement of the limits, the neutrino oscillation discovery can be expected.

22895 (RAL–89-106) **A compilation of data on single prompt photon production in hadron -hadron interactions.** Aurenche, P. (Durham Univ. (UK). Dept. of Physics); Whalley, M.R. Rutherford Appleton Lab., Chilton (UK). Sep 1989. 56p. (DPDG–89/04). Order Number DE90619111. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

A compilation of all the available data on Single Prompt Photon Production in Hadron-Hadron Interactions is presented, in both tabular and graphical form. Methods of interpreting these data in terms of a test of quantum chromodynamics (QCD) is also presented to indicate to the reader the scope and general status of the data. All the data in this review can be found in and retrieved from the Durham-RAL HEP Databases (HEPDATA on the RAL and CERN VM systems) together with data on a wide variety of other reactions. (author).

22896 (UCRL–98805) **Experimental search for free quarks in matter.** Hendricks, C.D.; Hornady, R.S. Lawrence Livermore National Lab., CA (USA). May 1988. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8810483–1: International conference on modern electrostatics, Beijing (China), 21-25 Oct 1988). Order Number DE90008359. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

An apparatus has been constructed for the measurement of very small electric charges on macroscopic particles with a charge resolution better than 0.05e. Together with the charge measurement system, a generator of small liquid particles has been assembled and used to test the system. To achieve the charge resolution desired, some of the problems which were solved included particle interactions resulting from induced dipoles, particle position and timing measurements to accuracies of a few microns and nanoseconds, operation in high vacuum to avoid aerodynamic effects, and spurious charging of the particles by external effects. The technique, which depends on simple, straight-forward deflection of particles in an electric field, is described and some particle charge measurements are presented.

22897 (UIUC-HEPG–89-18) **Review of charm decay results.** Gladding, G. Illinois Univ., Urbana, IL (USA). [1989]. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76ER01195. (CONF-8906204–7: International symposium on heavy quark physics, Ithaca, NY (USA), 13-17 Jun 1989). Order Number DE90007811. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

In this paper I review recent experimental results on the decays of the charmed mesons, D^0, D^+, and D_s. 27 refs., 7 figs., 3 tabs.

22898 (CONF-8906270–3) **Calculating coherent pair production with Monte Carlo methods.** Bottcher, C.; Strayer, M.R. Oak Ridge National Lab., TN (USA). [1989]. 37p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Summer school of computational atomic and nuclear physics; Sewanee, TN (USA); 26 Jun - 7 jul 1989. Order Number DE90008404. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

We discuss calculations of the coherent electromagnetic pair production in ultra-relativistic hadron collisions. This type of production, in lowest order, is obtained from three diagrams which contain two virtual photons. We discuss simple Monte Carlo methods for evaluating these classes of diagrams without recourse to involved algebraic reduction schemes. 19 refs., 11 figs.

22899 (DOE/ER/40173–5) **Studies in theorectical high energy particles physics: Technical progress report, February 1989–February 1990.** Aratyn, H.; Keung, Wai-Yee; Panigrahi, P.; Sukhatme, U. Illinois Univ., Chicago, IL (USA). Dept. of Physics. Feb 1990. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-84ER40173. Order Number DE90007752. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

This paper discusses the research being done at the University of Illinois in theoretical high energy physics. Some areas discussed are string models, collider physics, symmetries in gauge theories, sigma model, radiative decay of mesons, supersymmetry, superconducting, and hydroproduction of charm. (LSP)

22900 (DOE/ER/40215–T10) **On the uniqueness of the radiation amplitude zero in radiative W decay.** Samuel, M.A. (Concordia Univ., Sir George Williams Campus, Montreal, PQ (Canada). Dept. of Physics); Frank, M.; Hamzaoui, C.; Pouliot, D.; Samuel, K.B.; Li, Guowen. Oklahoma State Univ., Stillwater, OK (USA). Dept. of Physics. Oct 1989. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-85ER40215. Order Number DE90007671. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

It is well known that a radiation amplitude zero (RAZ) occurs in radiative W decay ($W^- \rightarrow d\bar{u}\gamma$ or $W^- \rightarrow e\bar{\nu}\gamma$). This RAZ can be used to measure the magnetic moment of the W boson to see if it has the gauge-theory value $\kappa = 1$, and, in this way, test the Standard Model (SM). In this paper we prove that the RAZ in this process is unique and, thus, the experimental discovery of any zero in this process implies that there exists a RAZ and, hence, $\kappa = 1$. 5 refs.

22901 (FNAL/C–89/265-T) **Critique of practical methods for computer evaluation of the hadron spectrum.** Mackenzie, P.B. Fermi National Accelerator Lab., Batavia, IL (USA). Dec 1989. 15p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-8909249–11: Lattice '89 international workshop, Capri (Italy), 18-21 Sep 1989). Order Number DE90008778. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

I review Monte Carlo algorithms for lattice QCD including the dynamical effects of quarks, emphasizing scaling behavior of the algorithms with lattice spacing, volume, and quark mass. 59 refs., 6 figs., 2 tabs.

22902 (LYCEN–88-18) **Wigner-Kirkwood expansion of the quasi-elastic nuclear responses and application to spin-isospin responses.** Chanfray, G. (Lyon-1 Univ., 69 - Villeurbanne (France). Inst. de Physique Nucleaire). Lyon-1 Univ., 69 - Villeurbanne (France). Inst. de Physique Nucleaire. 1988. 8p. (CONF-880386–: International conference on spin-observables of nuclear probes, Telluride, CO (USA), 14-18 Mar 1988). Order Number DE90756361. Available from NTIS (US Sales Only), PC A02/MF A01.

We derive a semi-classical Wigner-Kirkwood expansion (Planck constant expansion) of the linear response functions. We find that the semi-classical results compare very well to the quantum mechanical calculations. We apply our formalism to the spin-isospin responses and show that surface-peaked Planck constant^2 corrections considerably decrease the ratio longitudinal/transverse as obtained through the Los Alamos (longitudinal momentum) experiment.

22903 (UIUC-HEPG–89-17) **D^0–$\bar{D}^0$ mixing and CP violation: Experimental projections for a τ-charm factory.** Gladding, G. Illinois Univ., Urbana, IL (USA). Aug 1989. 18p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76ER01195. (CONF-8905144–15: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). Order Number DE90007810. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This report presents the results of a set of feasibility studies for observing D^0–$\bar{D}^0$ mixing and CP violation in the proposed high luminosity τ-charm factory. These studies are not yet complete, but clear general conclusions can already be drawn. In particular, a year of running with 10^{33} luminosity would allow observation of D^0–$\bar{D}^0$ mixing at the level of 10^{-4} to 10^{-5}, consistent with standard model expectations, while CP violation in the D system could be probed at the 10^{-2} level. 7 refs., 3 figs., 4 tabs.

6453 Particle Invariance Principles and Symmetries

22904 (FRNC-R–303) **Introduction to strings and superstrings.** Rausch de Traubenberg, M. Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires; Strasbourg-1 Univ., 67 (France). 1988. 97p. (In French). Order Number DE90756359. Available from NTIS (US Sales Only), PC A05/MF A01.

The string theory is applied in the construction of a theory which allows the coupling of the four fundamental interactions and matter. The original model of the string theory describes the hadronic phenomenon of duality. The model extension, which describes the

closed strings and those with a spin, is studied. The supersymmetry and the supersymmetric partner concepts are considered, in order to obtain a superstrings theory. The supersymmetry allows the formulation of a "supertheory", including matter, fields and gravitation. In order to explain the mass of the observable particles, the mechanism of symmetry breaking must be taken into account. The scalar state concept, originated from the supersymmetry breaking, is analyzed. This "supertheory" is not entirely accepted by the scientific world.

6454 Field Theory

22905 (CEA-CONF–9778) **Two-dimensional fractal geometry, critical phenomena and conformal invariance.** Duplantier, B. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service de Physique Theorique. 1988. 48p. (CONF-8805355–: Cargese School on common trends in statistical physics and field theory, Cargese (France), 24 May - 4 jun 1988). Order Number DE90756348. Available from NTIS (US Sales Only), PC A03/MF A01.

The universal properties of critical geometrical systems in two-dimensions (2D) like the O (n) and Potts models, are described in the framework of Coulomb gas methods and conformal invariance. The conformal spectrum of geometrical critical systems obtained is made of a discrete infinite series of scaling dimensions. Specific applications involve the fractal properties of self-avoiding walks, percolation clusters, and also some non trivial critical exponents or fractal dimensions associated with subsets of the planar Brownian motion. The statistical mechanics of the same critical models on a random 2D lattice (namely in presence of a critically-fluctuating metric, in the so-called 2D quantum gravity) is also addressed, and the above critical geometrical systems are shown to be exactly solvable in this case. The new "gravitational" conformal spectrum so derived is found to satisfy the recent Knizhnik, Polyakov and Zamolodchikov quadratic relation which links it to the standard conformal spectrum in the plane.

22906 (CEA-CONF–9795) **From the harmonic oscillator to the A-D-E classification of conformal models.** Itzykson, C. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service de Physique Theorique. 1988. 40p. (CONF-8810482–: Meeting on Integrable models in quantum field theory and statistical Mechanics, Kyoto (Japan), 17-28 Oct 1988). Order Number DE90756416. Available from NTIS (US Sales Only), PC A03/MF A01.

Arithmetical aspects of the solution of systems involving dimensional statistical models and conformal field theory. From this perspective, the analysis of the harmonic oscillator, the free particle in a box, the rational billards is effectuated. Moreover, the description of the classification of minimal conformal models and Weiss-Lumino-Witten models, based on the simplest affine algebra is also given. Attempts to interpret and justify the appearance of A-D-E classification of algebra in W-Z-W model are made. Extensions of W-Z-W model, based on SU(N) level one, and the ways to deal with rank two Lie groups, using the arithmetics of quadratic intergers, are described.

22907 (CEA-CONF–9805) **Level one Kac-Moody characters and modular invariance.** Itzykson, C. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service de Physique Theorique. 1988. 16p. (CONF-8803253–:). Order Number DE90756437. Available from NTIS (US Sales Only), PC A03/MF A01.

The analysis of SU(N) models, limited to the level one representations of its (untwisted) Kac-Moody or affine algebra, is reported. A discussion to characterize the content of a conformal invariant model is outlined, taking into account the existence of an automorphism of the Lie algebra (a specific property of SU(N), $N \geq 3$). The roots and conformal weights of SU(N) are obtained. It is shown that the obtained automorphism leave (restricted) affine characters invariant and is reflected in an automorphism of the Carton matrix (as well as its representative Dynkin diagramme), and of the root and weight lattices. The transformation under S from the explicit Kac-Weyl formula is considered in the discussion of Weiss-Lumino-Witten model. The validity of S and T formulas, of the level one $A_{N-1}^{(1)}$, to generate a representation of the modular group is proven.

22908 (CEA-CONF–9813) **Lattice models and conformal field theories.** Saleur, H. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service de Physique Theorique. 1988. 22p. (CONF-8805355–:). Order Number DE90756435. Available from NTIS (US Sales Only), PC A03/MF A01.

Theoretical studies concerning the connection between critical physical systems and the conformal theories are reviewed. The conformal theory associated to a critical (integrable) lattice model is derived. The obtention of the central charge, critical exponents and torus partition function, using renormalization group arguments, is shown. The quantum group structure, in the integrable lattice models, and the theory of Visaro algebra representations are discussed. The relations between off-critical integrable models and conformal theories, in finite geometries, are studied.

22909 (DOE/ER/40272–94) **Superstring field theory.** Preitschopf, C.R. (Florida Univ., Gainesville, FL (USA). Dept. of Physics); Thorn, C.B.; Yost, S.A. Florida Univ., Gainesville, FL (USA). Inst. for Fundamental Theory. [1989]. 14p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-86ER40272. (UFIFT-HEP–90-3;CONF-8911164–2: 1989 superstrings workshop, Tuscaloosa, AL (USA), 8-11 Nov 1989). Order Number DE90007694. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

We describe the construction of a class of cubic gauge-invariant actions for superstring field theory, and the gauge-fixing of one representative. Fermion string fields are taken in the $-\frac{1}{2}$-picture and boson string fields in the 0-picture, which makes a picture-changing insertion carrying picture number -2 necessary. The construction of all such operators is outlined. We discuss the gauge $b_1 + b_{-1} = 0$, in which the action formally linearizes. Nontrivial scattering amplitudes are obtained by approaching this gauge as a limit. 20 refs.

22910 (IPNO-TH–88-34) **BRST construction of interacting gauge theories of higher spin fields.** Cappiello, L.; Knecht, M.; Ouvry, S.; Stern, J. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. Jun 1988. 40p. Order Number DE90756353. Available from NTIS (US Sales Only), PC A03/MF A01.

The problem of constructing consistent interacting theories of an infinite tower of high-spin fields is formulated in terms of a field $\phi(X)$ defined on a finite or infinite-dimensional extended space-time manifold M, generalizing the concept of a string-field ϕ—$x(\sigma)$—. Using the techiques of BRST-cohomology we first analyze the conditions under which a system of compatible wave-equations for ϕ defines a gauge invariant free theory without ghosts in its physical sector. The necessary and sufficient conditions for the existence of a gauge-invariant cubic interaction are then shown to take the concise form of a graded Lie algebra, on which the BRST charge acts as an exterior derivative. Witten's string-field-theory is a particular realization of this algebra. The importance of a search for other realizations, possibly operating on a finite dimensional manifold M and/or leading to an interacting theory of massless gauge fields of any spin, is stressed and commented.

22911 (NIKHEF-H–89-17) **New algorithms for one-loop integrals.** Oldenborgh, G.J. van (Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands). Sectie H); Vermaseren, J.A.M. Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands). Sectie H. 6 Oct 1989. 29p. Order Number DE90618365. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

New algorithms are presented for evaluating the scalar one loop integrals for three- and four-point functions for arbitrary masses and external momenta. These formulations are useful both for analytic integration and for numerical evaluation in a computer program. The expressions are very compact and provide for an easy isolation of asymptotic behaviour and potential numerical problems. The tensor integrals have also been rewritten according to new algorithms, making it very easy to express amplitudes in terms of scalar-loop integrals. (author). 2 figs.; 133 schems.

22912 (RAL–89-096) **The space of string configurations in string field theory.** Bordes, J.; Lizzi, F. Rutherford Appleton Lab.,

Chilton (UK). Aug 1989. 10p. Order Number DE90618366. Available from NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

In this paper we consider the set of maps from the interval $(0,\pi)$ which constitute the argument of the functionals of a String Field Theory. We show that in order to correctly reproduce results of the dual model one has to include all square integrable functions in the functional integral, or Ω_0 in terms of Sobolev spaces. (author).

22913 (RRK–89-29) **Affine Toda field theory and exact S-matrices.** Braden, H.W. (Durham Univ. (UK). Dept. of Mathematical Sciences); Corrigan, E.; Dorey, P.E.; Sasaki, R. Hiroshima Univ., Takehara (Japan). Research Inst. for Theoretical Physics. Oct 1989. 57p. Order Number DE90759876. Available from NTIS (US Sales Only), PC A04/MF A01.

The masses and three-point couplings for all affine Toda theories are calculated. The exact factorisable S-matrices are conjectured on the basis of the classical masses and couplings and found, in the case of theories based on simply-laced algebras, to give consistent solutions to the bootstrap. An investigation of the properties of the exact S-matrices in perturbation theory is begun but non-perturbative methods will be required to understand the conjectured duality between weak and strong coupling which appears to be a striking feature of these theories. (author).

22914 (CONF-8909247–6) **Alpha-particles as probes of nuclear shape in the rare earths and structure effects on proton emission in the mass 80 region.** Sarantites, D.G. (Washington Univ., St. Louis, MO (USA). Dept. of Internal Medicine); Nicolis, N.G.; Abenante, V.; Majka, Z.; Semkow; Baktash, C.; Beene, J.R.; Garcia-Bermudez, G.; Halbert, M.L.; Hensley, D.C. Oak Ridge National Lab., TN (USA). [1989]. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400;FG02-88ER40406. From ACS symposium on exotic nuclear spectroscopy; Miami Beach, FL (USA); 11-15 Sep 1989. Order Number DE90007886. Available from NTIS, PC A03/MF A01; OSTI; INIS.

Low emission barriers and large subbarrier anisotropies in the alpha-particle decay with respect to the spin direction, of Sn and rare earth compound nuclei, are examined in the light of recent calculations incorporating deformation. For the rare earth systems deformation which increases with spin is necessary to explain the data. Energy spectra and angular correlations of evaporated protons from the $^{52}Cr(^{34}S, 2p2n)^{82}Sr$ reaction were measured in coincidence with discrete transition. Large changes in the shape of the proton spectra were observed when high spin states in different rotation al bands are populated. These effects cannot be explained by phase space arguments in the deexcitation process. They are interpreted as due to near-yrast to near-yrast stretched proton emission, which preferentially populates the yrast band by subbarrier protons. 20 refs., 8 figs.

22915 (DOE/ER/40437–2) **Calorimeter measurements in relativistic heavy-ion research: Progress in research.** Wolf, K.L. Texas A and M Univ., College Station, TX (USA). Research Foundation. Nov 1989. 21p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-88ER40437. Order Number DE90007672. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This paper discusses progress in the following areas: relativistic heavy-ion research; RHIC detector development; and cold fusion.

22916 (IPNO-TH–87-90) **Nuclear photoreactions at intermediate energies.** Christillin, P. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. Feb 1989. 111p. Order Number DE90756438. Available from NTIS (US Sales Only), PC A06/MF A01.

We review the interaction of real photons with nuclei up to the GeV region. The common microscopic description of exchange effects below threshold and of the corresponding real photoproduction above, is emphasized. The theoretical problems connected with π photoproduction in Δ region and vector meson photoproduction are spelled out and solved. The gross features of the reaction mechanism are shown to explain both the low energy region, the bulk properties around the Δ resonance as well as the appearance of shadowing only above ρ threshold.

22917 (ISN–8820) **The effective moment of inertia in ^{124}Xe, ^{126}Ba, ^{128}Ba, ^{129}Ce, ^{131}Ce and ^{162}Er isotopes.** Jerrestam, D. (Stockholm Univ. (SE). Inst. of Physics); Elfstrom, S.; Klamra, W.; Lindblad, T.; Linden, C.G.; Barci, V.; El-Samman, H.; Gizon, J. Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires. Mar 1988. 56p. Order Number DE90756408. Available from NTIS (US Sales Only), PC A04/MF A01.

The γ rays produced in the reactions of 118 MeV ^{12}C on ^{120}Sn, ^{122}Sn, ^{124}Te and 39.5 MeV ^{4}He on ^{161}Dy are investigated by using a sum spectrometer, a single NaI (Tl) detector and Ge (Li): s. Different nuclei were selected by setting gates on known transitions in the Ge (Li) spectra. The second effective moment of inertia J_{eff}^2 is extracted and compared with values from known discrete γ rays as well as with the results from Cranked Shell Model and a Cranked Nilsson Strutinsky calculations. The systematics of the $i_{13/2}$ neutron orbital is investigated.

22918 (JAERI-M–89-129) **Activation cross section data file, (1).** Yamamuro, Nobuhiro (Data Engineering Inc., Yokohama (Japan)); Iijima, Shungo. Japan Atomic Energy Research Inst., Tokyo (Japan). Sep 1989. 101p. (In Japanese). (NEANDC(J)–141/U;INDC(JPN)–128/L). Order Number DE90759875. Available from NTIS (US Sales Only), PC A06/MF A01.

To evaluate the radioisotope productions due to the neutron irradiation in fission of fusion reactors, the data for the activation cross sections ought to be provided. It is planning to file more than 2000 activation cross sections at final. In the current year, the neutron cross sections for 14 elements from Ni to W have been calculated and evaluated in the energy range 10^{-5} to 20 MeV. The calculations with a simplified-input nuclear cross section calculation system SINCROS were described, and another method of evaluation which is consistent with the JENDL-3 were also mentioned. The results of cross section calculation are in good agreement with experimental data and they were stored in the file 8, 9 and 10 of ENDF/B format. (author).

22919 (LBL–27840) **Nuclear Science Division annual report for the period October 1, 1987–September 30, 1988.** Mahoney, J. (ed.). Lawrence Berkeley Lab., CA (USA). Oct 1989. 122p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE90008058. Available from NTIS, PC A09/MF A01; OSTI; INIS; GPO Dep.

Highlights of the low energy research program included the identification of new super-deformed bands in gadolinium and palladium isotopes using the HERA array. Other work at the 88-Inch Cyclotron involved studies of the fragmentation of light nuclei; the spectroscopy of nuclear far from stability and interesting new experiments on the properties of the heaviest elements. Two other programs deserve special mention, the new program in Nuclear Astrophysics and the spectroscopic studies being carried out at OASIS. This isotope separator is now in full operation at the SuperHILAC after many yeas of development. At the Bevalac, important new results were obtained on the properties of hot dense nuclear matter produced in central collisions of heavy ions. First measurements were made using the di-lepton spectrometer which provide the most direct access to the conditions at the earliest stage of the reaction. New results on pion interferometry have been obtained using the Janus spectrometer and surprises continue to be found in careful analysis of data from the Plastic Ball detector, most recently the identification of a new component of hydrodynamic flow. Also at the Bevalac the intermediate energy program continued to grow, studying the evolution of the reaction mechanism from incomplete fusion to the fireball regime, as did the spectroscopic studies using secondary radioactive beams. The third major component of the experimental program is the study of ultra-relativistic nuclear collisions using the CERN SPS. This year saw the completing of analysis of the first round of experiments with important results being obtained on general particle production, the space-time evolution of the system and strangeness production.

22920 (ORNL/TM–11297/R1) **URR [Unresolved Resonance Region] computer code: A code to calculate resonance**

neutron cross-section probability tables, Bondarenko self-shielding factors, and self-indication ratios for fissile and fertile nuclides. Leal, L.C.; de Saussure, G.; Perez, R.B. Oak Ridge National Lab., TN (USA). 15 Feb 1990. 30p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90008023. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The URR computer code has been developed to calculate cross-section probability tables, Bondarenko self-shielding factors, and self-indication ratios for fertile and fissile isotopes in the unresolved resonance region. Monte Carlo methods are utilized to select appropriate resonance parameters and to compute the cross sections at the desired reference energy. The neutron cross sections are calculated by the single-level Breit-Wigner formalism with s-, p-, and d-wave contributions. The cross-section probability tables are constructed by sampling by Doppler broadened cross-sections. The various self-shielding factors are computer numerically as Lebesgue integrals over the cross-section probability tables.

22922 (INIS-mf–11545) **Nucleon multiplicities after pion absorption in ^{16}O.** Hamers, R. Amsterdam Univ. (Netherlands). 12 Jan 1989. 86p. Order Number DE90706037. Available from NTIS (US Sales Only), PC A05/MF A01; OSTI; INIS.

The experiment described in this thesis concerns a simultaneous measurement of two- and higher-fold coincidences following positive and negative pion absorption in $_{16}$O. The detected particles are protons, neutrons and deuterons. The detection and analysis of charged particles is discussed. The incident pion energy was 65 MeV, thus well below the delta resonance. The low pion energy was 65 MeV, thus well below the delta resonance. The low pion energy ensures that contributions of initial state interactions, i.e. pion-nucleon scattering preceding absorption, are minimized. The following reaction channels were selected and analysed: (π^+,pp), (π^+,pd). Evidence for quasifree reaction precessed has been investigated by comparing the data with phase-space calculations incorporating the geometry of the experimental setup. 36 refs., 1 fig., 3 tabs.

22923 (INIS-mf–11553) **Ground-state correlations in ^{12}C and the mechanism of the (e,e′p) reaction.** Steenhoven, G. van der. Vrije Univ., Amsterdam (Netherlands). 3 Nov 1987. 148p. Order Number DE90706045. Available from NTIS (US Sales Only), PC A07/MF A01; OSTI; INIS.

In this thesis the results of an investigation into two aspects of the mechanism of the quasi-elastic (e,e′p) reaction: the interaction between the incident electron and the bound proton and the residual nucleus (final-state interaction (FSI)), are presented and used in the extraction of nuclear-structure information from (e,e′p) measurements on ^{12}C. The experiments were carried out at NIKHEF-K with a high resolution spectrometer. Two kinds of experiments have been performed on ^{12}C. The first was aimed at obtaining accurate momentum distributions for various final states in ^{11}B. Some special measurements were carried out in order to vary the parameters influencing the FSI. The role of coupled-channels effects in the ^{12}C(e,e′p)^{11}Be reaction is discussed. It is discussed whether some of the weak transitions observed in this reaction can be associated with knockout from normally unoccupied shell-model orbitals. The second experiment on ^{12}C was devoted to the e-p coupling. These measurements were supplemented with data taken on ^{6}Li. The later measurement allowed for measuring simultaneously knockout from the relatively dense ^{4}He core and the relatively dilute deuteron. In this way the density dependence of the e-p coupling in the nucleus could be studied. The results of these experiments have been compared to various models that take into account the effect of the nuclear medium upon the e-p coupling. The possible role of charge-exchange and meson-exchange currents in the interpretation of these experiments is also considered. A brief survey of the formalism of the quasi-elastic (e,e′p) reaction is also presented. 196 refs., 53 figs., 21 tabs.

22924 (ISN–88-05) **On the spin-orbit deformation in inelastic scattering of polarized protons at intermediate energy.** Swiniarski, R. de; Pham, D.L. Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires. Jan 1988. 20p. Order Number DE90756409. Available from NTIS (US Sales Only), PC A03/MF A01.

Coupled-channels analyses of both cross-sections and analysing powers data have been performed for low-lying states for ^{16}0(p vector, p), ^{18}0(p vector, p) at 0.8 GeV and ^{12}C (p vector, p') obtained for an energy range between 398 MeV and 697 MeV to study the importance of the deformed Spin-orbit potential. The angular distributions of A_y are very well reproduced only with a full Thomas Spin-orbit potential. The calculations for ^{16}0 and ^{18}0 data have shown that the deformed Spin-orbit term has only minor effect on the inelastic angular distributions and for A_y these calculations strongly suggest that the central and the Spin-orbit deformations should be equal. On the other hand a different behavior is observed for ^{12}C(p vector, p'): first the presence of the deformed Spin-orbit term is essential to reproduce not only analysing power data but also inelastic angular distributions and secondly, for all energies investigated the deformation of the Spin-orbit potential should be greater than that of the central potential.

22925 (JAERI-M–90-012) **Evaluation of neutron nuclear data for ^{16}O.** Shibata, Keiichi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Chiba, Satoshi; Nakajima, Yutaka; Asami, Tetsuo; Murata, Toru; Kanda, Yukinori; Tanaka, Shigeya. Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment. c Feb 1990. 32p. (NEANDC(J)–147/U;INDC(JPN)–134/L). Available from Japan Atomic Energy Research Inst., Tokai-mura, Naka-gun, Ibaraki-ken 319-11, Japan.

Neutron nuclear data of ^{16}O have been evaluated for JENDL-3 in the energy range from 10^{-5} eV to 20 MeV. Evaluated quantities are the total, elastic and inelastic scattering, (n,2n), (n,γ), (n,p), (n,d), (n,α), (n,np) and (n,nα) reaction cross sections and the angular and energy distributions of emitted neutrons and gamma-rays. The total cross section below 3 MeV was calculated on the basis of the R-matrix theory. The inelastic scattering, (n,np) and (n,nα) reaction cross sections were obtained from the statistical model calculation. The gamma-ray production cross section was also calculated with the statistical model. 39 refs., 18 figs., 4 tabs.

22926 (CONF-900147–2) **Populations of excited states and reaction mechanisms in the emission of complex fragments.** Gomez del Campo, J. Oak Ridge National Lab., TN (USA). [1990]. 14p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 13. symposium on nuclear physics; Oaxtepec (Mexico); 3-6 Jan 1990. Order Number DE90007481. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Cross sections for emission of complex fragments (Z>2) in their ground and excited states are presented for several heavy-ion reactions at bombarding energies above 10 MeV/nucleon. Data presented are mostly on the cross sections extracted by γ-ray techniques. It is shown that a simple statistical approach to associate the ratio, of cross sections for excited states and ground states, to the temperature of the emitter fails to give the expected temperatures. However, it is shown that this is mostly due to the

fact that the fragments that γ decay are secondary fragments, produced by the particle decay of the primary emitted complex fragments. A Hauser-Feshbach analysis accounts well for the cross sections and extracted temperatures. 22 refs., 6 figs.

22927 (KURRI-TR–318, pp. 30-34) **Measurements of X-rays and low-energy β-rays with a liquid scintillation counter.** Furukawa, M. (Nagoya Univ. (Japan). Faculty of Science). Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst. May 1989. (In Japanese). (CONF-8901177–: 1. specialist research meeting on studies of nuclear chemistry and nuclear physics at research reactor, Kumatori (Japan), 24-25 Jan 1989). 22928 (UCRL–101772) **Nuclear structure effects in exciton level densities.** Blann, M. Lawrence Livermore National Lab., CA (USA). Oct 1989. 11p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8911128–5: NEANDC specialists' meeting on level densities, Bologna (Italy), 15-17 Nov 1989). Order Number DE90008351. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We summarize experimental (p,n) spectra which illustrate nuclear structure effects in the precompound spectra for nuclei in the A=60 and A=90 regions. Results of spectra calculated using the Williams method of computing few quasiparticle densities are compared with data using three different sets of single particle levels including recent results due to Moller and Nix. Attention is drawn to the importance of angular momentum coupling in determining the final structure of the experimental spectra. 10 refs., 8 figs.

22929 (DOE/ER/10495–3) **Study of transitional nuclei at TRISTAN: Progress report.** Petry, R.F. Oklahoma Univ., Norman, OK (USA). [1983]. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AS05-79ER10495. Order Number DE90007668. Available from NTIS, PC A02/MF A01; OSTI; INIS.

At present there are six decay studies at TRISTAN in which the Oklahoma group has a major participation. These involve the decay of ^{99}Sr, ^{145}Ca, ^{147}La, ^{99}Rb, ^{101}Sr and ^{101}Y. These projects are in varying stages of completion and will be discussed individually in this paper. During the first third of this contract year (6/1/82–10/1/82) time at TRISTAN was devoted to ion-source and other facility development. Two new ion sources were developed and tested, a surface ionization source with a Ta ionizer and a FEBIAD-type plasma source. Both worked very well and with excellent reliability. In addition some work was done toward developing a surface ionization ion source for negative ions of Br and I, which are of special interest to the Oklahoma project. Further development of this source was postponed in favor of production runs with the other two, and a variety of new possibilities for future work have become available from these sources.

22930 (KURRI-TR–318, pp. 83-86) **Decays of ^{147}Ba and ^{147}La using KUR-ISOL.** Aoki, K. (Himeji Inst. of Tech., Hyogo (Japan)); Okano, K.; Kawase, Y. Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst. May 1989. (In Japanese). (CONF-8901177–: 1. specialist research meeting on studies of nuclear chemistry and nuclear physics at research reactor, Kumatori (Japan), 24-25 Jan 1989). 22931 (UCRL–98618) **In-beam studies of ^{96}Zr and ^{98}Zr: Collective excitations.** Henry, E.A. (Lawrence Livermore National Lab., CA (USA)); Meyer, R.A.; Aprahamian, A.; Mann, L.G.; Roy, N.; Maier, K.H. Lawrence Livermore National Lab., CA (USA). 18 Apr 1988. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8804119–5: International workshop on nuclear structure of the zirconium region, Bad Honnef (Germany, F.R.), 24-28 Apr 1988). Order Number DE90008358. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Nearly two decades ago signatures of deformation in the ground state bands of ^{100}Zr and ^{102}Zr were identified, and the rapid change in the deformation of heavy zirconium nuclei noted. It is now well accepted that the short-range proton-neutron interaction between the $1g_{9/2}$ and $1g_{7/2}$ spin-orbit partners plays an important role in producing ground state deformation in this region. Nevertheless, recent studies of zirconium nuclei, including those in the transition region, continue to refine our understanding of the interplay between single-particle and collective degrees of freedom. In this report we discuss some aspects of the level structures of ^{96}Zr and ^{98}Zr with emphasis on collective excitations. 18 refs., 2 tabs.

22932 (CLM-R–295) **A neutron activation, transmutation and dose rate benchmark study.** Sublet, J.Ch. (UKAEA Culham Lab., Abingdon (UK)); Mann, F.M.; Ponti, C. UKAEA Culham Lab., Abingdon (UK). Sep 1989. 42p. Available from H.M. Stationery Office, London, price Pound 10.00. Available from H.M. Stationery Office, London, price Pound 10.00.

Deuterium-Tritium (D-T) plasmas are strong sources of 14 MeV neutrons, which are transmitted through the different components of the fusion reactor. During this process they induce activity by transmutation reactions in the structural materials. Three different computer code systems for predicting induced activation and transmutation reactions have been implemented with the same input data appropriate to JET conditions in order to compare their predictions. The results of this benchmark comparison show, in general, fairly close agreement. However, differences of up to a factor 84 could appear between the predictions of the induced activity of the different codes for specific radionuclides. In the case of some shorter-lived radionuclides the lack of agreement could be due to differences in the decay data, whilst for the better-known and less numerous long lived isotopes the differences are associated with variations in the cross section data for those isotopes. (author).

22933 (CRN-PN–8803) **High spin levels populated in multinucleon transfer reaction with 480 MeV ^{12}C.** Kraus, L. (and others); Boucenna, A.; Linck, I. Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires; Strasbourg-1 Univ., 67 (France). 1988. 36p. Order Number DE90756410. Available from NTIS (US Sales Only), PC A03/MF A01.

Two- and three-nucleon stripping reactions induced by 480 MeV ^{12}C have been studied on ^{12}C, ^{16}O, ^{28}Si, ^{40}Ca and ^{54}Fe target nuclei. Discrete levels are fed with cross sections up to 1 mb/sr for d-transfer reactions and one order and two orders of magnitude less for 2p- and ^{3}He-transfer reactions, respectively. These reactions preferentially populate high spin states with stretched configurations. Several spin assignments were known from transfer reactions induced by lighter projectiles at incident energies well above the Coulomb barrier. In the case of two-nucleon transfer reactions, the energy of these states is well reproduced by crude

shell model calculations. Such estimates are of use in proposing spins of newly observed states especially as the shapes of the measured angular distributions are independent of the final spin of the residual nucleus.

22934 (DOE/ER/40264–4) **Theoretical research in nuclear structure and nuclear collective motion: Progress report, March 1, 1989–February 28, 1990.** Klein, A. Pennsylvania Univ., Philadelphia, PA (USA). Jan 1990. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-86ER40264. Order Number DE90008427. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The work described in this report falls into two main categories, large amplitude collective motion and boson mappings of Lie algebras for use in nuclear physics.

22935 (GANIL-P–87-27) **Collision effects on the nuclear dynamics.** Gregoire, C. Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). 1987. 71p. (In French). Order Number DE90756358. Available from NTIS (US Sales Only), PC A04/MF A01.

The lectures on the collision effects on the nuclear dynamics are reported. A kinetic equation, describing the nuclear dynamics in a microscopical way, is deduced. The Vlasov equation and methods, allowing the obtention of approached solutions, are indicated. Concerning one dimensional and spherical symmetric systems, these solutions applied to the matter slab collisions and to the expansion of the excited spherical cores, are discussed. Moreover, the phenomenology of the collision terms and their application on the heavy ions collisions, are considered. The respective parts of the mean field and the collision term in different cases, are indicated. A link with the transport theories is given by the calculations of dispersions and by means of the Landau-Vlasov equation.

22936 (GSI–89-31) **Electron-positron angular correlation in the pair conversion.** Hofmann, C. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany, F.R.); Frankfurt Univ. (Germany, F.R.). Inst. fuer Theoretische Physik. Dec 1989. 92p. (In German). Available from Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany, F.R.). Available from Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany, F.R.).

The angular correlation in the pair conversion was calculated with Coulomb-deformed scattering waves for the electron wave functions. The angular correlation for the E0 conversion agrees for high nuclear transition energies and nuclear charges $Z < 100$ well with the already known angular correlation obtained in Born approximation. Going to lower transition energies and extremely high nuclear charges larger differences to the Born approximation are present. (orig./HSI).

22937 (IPNO-TH–87-52) **Signals of a phase transition in nuclear breakup.** Campi, X. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1987. 7p. (CONF-871243–: Symposium on hot nuclei, College Station, TX (USA), 7-10 Dec 1987). Order Number DE90756442. Available from NTIS (US Sales Only), PC A02/MF A01.

We show that nuclei break up like finite systems that exhibit a clean phase transition in infinite size. This is done by studying conditional moments of the fragment multiplicities, the largest fragment size produced by event and its fluctuations. The nature of this smooth phase transition cannot be determined from the available experimental data. The "critical point" is reached when the energy deposited in the nucleus is 90% of its binding energy.

22938 (ISN–87-90) **Short range correlations: few-body systems.** Silvestre-Brac, B. Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires. 1987. 78p. (In French). (CONF-8709402–: The Joliot-Curie 1987 nuclear physics school, Maubuisson (France), 14-18 Sep 1987). Order Number DE90756445. Available from NTIS (US Sales Only), PC A05/MF A01.

In these lectures, we present the correlations in few-body systems. The probability densities for quarks inside a baryon and for nucleons inside a nucleus are commented in detail and reported on a number of photos. The emphasis is put on the link between the forces acting upon quarks and the forces acting upon nucleons. Several systems are analysed carefully: the diquarks, the baryons, the N-N interaction, the H dibaryon and the nuclei ^{2}H, ^{3}H, ^{4}He.

22939 (ISN–8810) **On the role of quantum tunneling and statistical effects in the liquid gas phase transition of hot nuclei.** Blin, A.H. (Institut fuer Theoretische Physik, Regensburg Univ. (DE)); Hiller, B.; Reinhard, H.; Schuck, P. Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires. Jan 1988. 39p. Contract de Br 733/4-1. Order Number DE90756454. Available from NTIS (US Sales Only), PC A03/MF A01.

The triggering of the liquid-gas phase transition in hot nuclear matter by quantum and statistical fluctuations is studied in a microscopic approach to nucleation which is a fluid-dynamical version of the imaginary-time dependent mean-field theory at finite temperature. It is found that quantum tunnelling processes are only important below T = 1 MeV.

22940 (JAERI-M–90-006) **A nuclear cross section calculation system with simplified input-format: Version 2, (SINCROS-II).** Yamamuro, Nobuhiro. Japanese Nuclear Data Committee, Tokai, Ibaraki (Japan). c Feb 1990. 64p. (NEANDC(J)–146/U;INDC(JPN)–133/L). Available from Japan Atomic Energy Research Institute, Dept. of Technical Information, Tokai-mura, Naka-gun, Ibaraki-ken 319-11, Japan.

A Nuclear Cross Section Calculation System with Simplified Input-Format, Version-II (SINCROS-II) has been developed by improving the functions of the program in SINCROS-I, and preparing some process codes for the cross section applications. There is the option of optical-model potentials for neutron and proton, and the capture cross section normalization to the experiment and the width fluctuation correction to compound nuclear cross section become possible. The method recommended for nuclear cross section calculation is described. This system will be used to estimate the cross sections of nuclei for which the experimental data do not exist. 39 refs., 40 figs., 7 tabs.

22941 (N–90-14890) **Calculation of two-neutron multiplicity in photonuclear reactions.** Norbury, J.W.; Townsend, L.W. National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center. Jan 1990. 11p. (NASA-TP–2968;L–16610;NAS–1.60:2968). Available from NTIS, PC A03/MF A01.

The most important particle emission processes for electromagnetic excitations in nucleus-nucleus collisions are the ejection of single neutrons and protons and also pairs of neutrons and protons. Methods are presented for calculating two-neutron emission cross sections in photonuclear reactions. The results are in a form suitable for application to nucleus-nucleus reactions.

22942 (UCRL–101262) **Precompound decay models for medium energy nuclear reactions.** Blann, M. Lawrence Livermore National Lab., CA (USA). Nov 1989. 20p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-891103–67: Winter meeting of the American Nuclear Society, San Francisco, CA (USA), 26-30 Nov 1989). Order Number DE90008352. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The formulations used for precompound decay models are presented and explained in terms of the physics of the intranuclear cascade model. Several features of spectra of medium energy (10–1000 MeV) reactions are summarized. Results of precompound plus evaporation calculations from the code ALICE are compared with a wide body of proton, alpha, and heavy ion induced reaction data to illustrate both the power and deficiencies of predicting yield of these reactions in the medium energy regime. 23 refs., 13 figs.

22943 (UCRL–102806) **N-p bremsstrahlung in heavy ion collision processes.** Blann, M. Lawrence Livermore National Lab., CA (USA). 16 Jan 1990. 8p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-900179–1: Los Alamos National Laboratory (LANL) workshop on n-p Bremsstrahlung, Los Alamos, NM (USA), 25-26 Jan 1990). Order Number DE90008542. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The goal of this presentation is to summarize the current status of the interpretation of energetic γ-rays in heavy ion collisions via the n-p-bremsstrahlung mechanism. An essential element of the

topic is a transport equation to approximate the fast non-equilibrium nucleon-nucleon cascade/emission stage of the heavy ion reactions. It is during this stage that we expect the n-p-bremsstrahlung processes to produce energetic photons. I shall begin with a very brief description of the Boltzmann master equation (BME) model which will be used as the transport code, deferring to earlier works for a more complete description, and present but a single representative comparison with an experimental neutron emission spectrum. I shall then summarize the status of the elementary n-p-γ cross section needed to extend the transport code to photon emission in heavy ion reactions, and summarize the status of these comparisons with data. 29 refs., 4 figs.

22944 (UCRL–102923) **Microscopic optical model calculations of nucleon-nucleus scattering over wide mass and energy rates.** Hansen, L.F. Lawrence Livermore National Lab., CA (USA). 9 Feb 1990. 17p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8909300–2: International school on nuclear physics, neutron physics and nuclear energy conference, Varna (Bulgaria), 29 Sep - 7 oct 1989). Order Number DE90008546. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Microscopic optical model potentials are tested against a large body of measurements of elastic differential cross sections and analyzing powers for neutrons (8–40 MeV) and protons (16–60 MeV) scattered from targets ranging from ^{6}Li to ^{208}Pb. Reasonably good fits to the data can be found using only three parameters, λ_V, λ_W and λ_{SO}, normalizing constants to the real, imaginary and spin orbit potential, respectively. These parameters have a smooth dependence on energy and mass number. 17 refs., 8 figs.

22945 (BNL–43872) **Neutrons: The kinder, gentler probe of condensed matter.** Axe, J.D. Brookhaven National Lab., Upton, NY (USA). [1989]. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-891119–110: Materials Research Society fall meeting, Boston, MA (USA), 27 Nov - 2 dec 1989). Order Number DE90008511. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Neutrons play an increasingly important role in the characterization of advanced modern materials. They provide information that complements rather than competes with that provided by other scattering probes. Although neutrons require heroic efforts to produce, the techniques for using them are not particularly difficult, and with the advent of sufficient user friendly facilities, are becoming a routine tool in the arsenal of expanding numbers of materials scientists. 10 refs., 5 figs.

22946 (ECN–216) **User's guide for the small-angle neutron scattering facility.** Vlak, W.A.H.M.; Werkhoven, E.J. Netherlands Energy Research Foundation, Petten (Netherlands). Apr 1989. 79p. Order Number DE90706032. Available from NTIS (US Sales Only), PC A05/MF A01; OSTI; INIS.

This report serves as a manual for the users of the small-angles neutron scattering instrument located at beamport HB3 of the High Flux Reactor in Petten. The main part of the text is devoted to the control of the facility and the data handling by means of a μVAX computer. Also, the various possibilities to access the facility across computer networks are discussed. A collection of menu-driven and command-driven programs, which utilize the flexibility of the VMS operating system without requiring detailed knowledge of the user about the computer environment, enables to control the instrument. For the convenience of the experienced user, who might wish to update or extend the software, a technical supplement is included. 8 refs., 15 figs.

22947 (KEK–89-13) **The 2nd KEK symposium on ultracold neutrons (UCN) and fundamental physics with slow neutrons.** Yoshiki, H. (ed.). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Oct 1989. 137p. (In Japanese). (CONF-8903201–: 2. KEK symposium on ultracold neutrons (UCN) and fundamental physics with slow neutrons, Tsukuba (Japan), 11 Mar 1989). Order Number DE90760025. Available from NTIS (US Sales Only), PC A07/MF A01.

This issue is the collection of the papers presented at the title symposium. The 15 of the presented papers are indexed individually. (J.P.N.).

22948 (KURRI-TR–318, pp. 22-25) **A method of intensity determination of γ-rays emitted from weak short-lived radioactive sources.** Baba, H. (Osaka Univ., Toyonaka (Japan). Faculty of Science). 22949 (LAL–88-55) **Transition radiation.** Fayard, L. Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire. Nov 1988. 14p. (CONF-8809411–:). Order Number DE90756405. Available from NTIS (US Sales Only), PC A03/MF A01.

Theoretical description, properties and applications of the radiation produced by a charged particle, passing through the interface between two different dielectric media, is given. Equations for normal and oblique incidence, and for the vacuum-medium transition are described. The case of non relativistic limit, the length of formation zone, as well as the Wartski interferometer formulas are considered. Results for ultra-relativistic charged particles with a multifoil radiator and an X-ray detector are presented. The forward and backward radiation case, the transition radiation produced by a single foil and by a periodic radiator are described. The procedure to optimize the parameters of a detector device is given.

22950 (PNL–6100-Pt.4, pp. 21-22) **Doubly differential ionization cross sections for intermediate-velocity heavy ions.** Goldhagen, P.; Toburen, L.H.; DuBois, R.D. Pacific Northwest Lab., Richland, WA (USA). Feb 1987. In *Pacific Northwest Laboratory: Annual report for 1986 to the DOE Office of Energy Research: Part 4, Physical sciences.* Order Number DE87010025. Available from NTIS, PC A04/MF A01.

The interaction of fast neutrons in tissue results in the production of recoil ions that deposit energy along densely ionizing charged particle tracks. Although a great deal of information exists regarding ionization by the recoiling of protons and by nuclear reaction induced alpha particles, little is known about the detailed ionization cross sections for the heavier recoil ions (such as carbon, oxygen, and nitrogen) that also may be produced by interactions of neutrons in tissue. Measurements were conducted for oxygen ion energies from 1.3 to 3.3 MeV. The cross sections for emission of low-energy electrons increase as the ion charge state increases. The interaction strength is proportional to its net charge. For high-energy ejected electrons similar cross sections are expected for all charge states. However, a clear decrease was shown in the cross sections for electrons ejected with energies higher than about 500 eV by the higher-charged ions compared to electrons of similar energy that are ejected by lower-charged ions. For intermediate- to low-energy ion collisions it may be speculated that the emission cross sections should depend more on the kinetic parameters of the collision and the total number of electrons involved than on the detailed atomic or molecular structure of the colliding partners. Because outer-shell ionization involves numerous potential curve crossings, rearrangement on a statistical basis would be expected with individual states losing their identity relative to the observed electron spectra. If this concept has any validity, similar electron spectra and yields would be expected to be produced by collision systems of similar relative velocities and total electron number.

22951 (RAL–89-104) **Final state effects in deep inelastic neutron scattering.** Mayers, J. Rutherford Appleton Lab., Chilton (UK). Sep 1989. 29p. Order Number DE90619118. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

A new formulation of final state effects (FSE) in deep inelastic neutron scattering (DINS), which allows for simple intuitive interpretations is presented. It is shown that at high momentum transfer q, FSE can be formulated in terms of a single function $\phi_\omega(r)$, where r is the position coordinate of the struck atom and the functional form of ϕ_ω depends only on ω, the energy transfer. It follows from this formulation that if final state effects are represented as a convolution of a broadening function R, with the impulse approximation prediction for $S(q,\omega)$, R depends strongly on the form of the atomic momentum distribution. Previous treatments which formulate FSE in superfluid He4 in terms of R, but which neglect the presence of the Bose condensate in the calculation of R, are inconsistent and underestimate final state broadening of the condensate. It is predicted that incoherent scattering from the Bose condensate is negligible and suggested that the condensate makes a finite contribution to $S(q,\omega)$ via coherent scattering at all q. A simple argument is presented, which shows, that FSE in quantum fluids are significant at all attainable momentum transfers. (author).

22952 (DOE/ER/60707–2) **Considerations of beta and electron transport in internal dose calculations: Progress report.** Poston, J.W. Sr. (Texas A and M Univ., College Station, TX (USA). Dept. of Nuclear Engineering); Bolch, W.E. Texas A and M Univ., College Station, TX (USA). Research Foundation. 26 Feb 1990. 148p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-88ER60707. Order Number DE90008413. Available from NTIS, PC A07/MF A01; OSTI; INIS; GPO Dep.

A computer program has been developed at Texas A & M University to model the transport and energy deposition of electrons and photons for use in internal dose estimation. The code incorporates photon and electron transport subroutines with the geometry subroutine from ALGAM. A user code, called INDOSE, was used to provide estimates of the absorbed fraction of energy for selected target organs of a mathematically described human phantom. The INDOSE code is comprised of three primary sections: the MAIN program, AUSGAB, the scoring routine, and POSITIN, the geometry tracking routine. The geometry routine contains a mathematical representation of Reference Man. The total-body phantom consists of three principal sections and of three types of tissue: lung, skeletal tissue, and soft tissue. The skeletal system represents the total content of the intact skeleton and includes both bone and marrow. This material is considered to be distributed homogeneously throughout the phantom. In 1988, a research proposal was submitted to the Department of Energy (DOE) to continue the code development for use in internal dosimetry calculations, particularly those related to diagnostic nuclear medicine procedures. This document presents a progress report for the completion of tasks accomplished over the period of July 1989 through January 1990. 39 refs., 45 figs., 24 tabs.

22953 (DOE/ER/60867–1) **Macrodosimetry and microdosimetry in radioimmunotherapy: Progress report, July 15, 1989–July 14, 1990.** Leichner, P.K. Johns Hopkins Oncology Center, Baltimore, MD (USA). Feb 1990. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-89ER60867. Order Number DE90007366. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This progress report summarizes the research accomplished and its clinical implementation since July 15, 1989. To improve beta-particle dosimetry, a point-source function was developed that is valid for a wide range of beta-particle emitters. An analytical solution for beta-particle dose rates within and outside of slabs of finite thickness was validated in an experimental tumor system and is now being used in clinical radioimmunotherapy (RIT). Quantitative SPECT was validated in phantom studies, beagle dogs, and patients with Kaposi's sarcoma. It is currently being used in clinical RIT for patients with Hodgkin's disease or hepatoma. Additionally, methodologies and computer software are being developed for quantitative autoradiography to achieve absorbed-dose calculation on the cellular level. 7 refs., 1 tab.

22954 (STUK-A–81) **Radioactivity of people in Finland in 1987: Supplement 7 to annual report STUK-A-74.** Rahola, T.; Suomela, M.; Illukka, E.; Pusa, S. Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland). Aug 1989. 69p. Order Number DE90619708. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

The atmospheric nuclear bomb tests in the 1950s, '60s and '70s caused global radioactive fallout. After the reactor accident at Chernobyl on April 26, 1986, radioactive fallout was carried by by air streams to most parts of Europe. In 1987 radionuclides causing internal contamination were transported to man only via different foodchains and no longer via inhalation, as had happened immediately after the Chernobyl accident. To determine the level of radionuclides in the body and to estimate the internal radiation doses caused by the Chernobyl accident, whole-body counting measurements were performed. Ten different groups of people were measured during 1987. Three were local reference groups, two groups of radiation workers, one a population group representing the whole country and four groups representing those with special dietary habits. The weighted mean ^{137}Cs body burden in the population group was 2000 Bq at the end of 1987, the minimum body burden being 200 Bq and the maximum 10000 Bq. The measurement results showed that the maximum body burdens were reached in the summer 1987. The groups with special diets did not necessarily follow this pattern. The mean effective dose equivalents delivered in 1987 to people in Finland, estimated by using the measurement results of the population group, was 0.08 mSv, the corresponding dose equivalent in 1986 bein 0.06 mSv.

22955 (CEA-CONF–9816) **Conformal invariance self-avoiding walks in the plane or on a random surface.** Duplantier, B. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service de Physique Theorique. 1988. 17p. (CONF-8806456–: Meeting on fields, strings and critical phenomena, Les Houches (France), 28 Jun - 5 aug 1988). Order Number DE90756364. Available from NTIS (US Sales Only), PC A03/MF A01.

The two-dimensional (2D) properties of polymers embedded in a solvent, are studied. They are modeled on a lattice by self-avoiding walks. The polymer properties either in the plane with a fixed metric, or on a random 2D surface, where the metric has critical fluctuations, are considered. In the scope of the work, the following topics are discussed: the watermelon topology; the O(n) model and Coulomb gas technique; the model and critical behaviours of polymers on a two-dimensional random lattice; the conformal invariance in a random surface and higher topologies.

22956 (CONF-8909210–6) **Collective aspects of charged particle track structure.** Basbas, G. (Physical Review Letters, Ridge, NY (USA)); Howie, A.; Ritchie, R.H. Oak Ridge National Lab., TN (USA). [1989]. 21p. Sponsored by U.S. DOE Energy Research; North Atlantic Treaty Organization; National Science Foundation. DOE Contract AC05-84OR21400. From 12. Werner Brandt international workshop on charged particle penetration phenomena; San Sebastian (Spain); 4-7 Sep 1989. Order Number DE90008406. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A plasmon generated by a swift charged particle constitutes a coherent excitation about the particle track. We discuss the representation of collective modes in impact parameter space when created by a swift ion or a fast electron, and the decay of these modes into localized excitations. Several alternative spatial representations are considered. We show that the high spatial resolution found in secondary electron emission measurements with scanning electron microscopy is consistent with the existence of the plasmon as an intermediary between the fast incident electron and the measured secondary electrons. 24 refs., 6 figs.

22957 (CONF-8909210–7) **Bremsstrahlung Induced by 50 MeV H° bombardment.** Stein, C. (Air Force Weapons Lab., Kirtland AFB, NM (USA)); Habiger, K.W.; Smith, B.R.; Crawford, O.H.; Ritchie, R.H. Oak Ridge National Lab., TN (USA). [1989]. 16p. Sponsored by U.S. Department of Defense; U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Contract 1418-1418-A1. From 12. Werner Brandt international workshop on charged particle penetration phenomena; San Sebastian (Spain); 4-7 Sep 1989. Order Number DE90008410. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Three different thicknesses of aluminum targets, 0.0025 cm, 0.025 cm, and 0.32 cm were irradiated with 50-MeV neutral hydrogen atoms and the resultant bremsstrahlung radiation measured. The experimental results are compared with calculations that include bremsstrahlung by the projectile's electron and its cascade, bremsstrahlung by the cascade electrons that are generated by the projectile nucleus and quasifree-electron bremsstrahlung. The theoretical and experimental values of the total yield agree within a factor of three for all target thicknesses and all bremsstrahlung energies. 16 refs., 4 figs.

22958 (DOE/ER/13441–6) **Interactions of molecules with surfaces: Progress report, February 1989–January 1, 1990.** Greene, E.F. Brown Univ., Providence, RI (USA). Jan 1990. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-85ER13441. Order Number DE90007555. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This is a report of the progress made on four projects supported by DOE Grant FG02-85ER13441 in the period 1 February 1989 to 31 December 1989. A long term study of the rate of transfer of electrons between gas atoms and the surfaces of crystals, using the technique of surface ionization, reached a point where it could be submitted for publication. Measurement of the energy dependence of the yields of Na^+, K^+, and Cs^+ ions formed when beams of the corresponding alkali atoms M hit a Si(111) surface and of Na^+ for Na striking a Pt surface at a temperature T are those expected for equilibrium for thermal kinetic energies of the incident atoms. Energy transfer to surfaces has been studied by measuring the temperature rises of thermocouple surfaces exposed to molecular beams. He diffraction has been used to follow structural phase transitions on the (111) and (100) surfaces of Si and Ge. Work is in progress to measure the effect of adsorbed atoms on the forces parallel to the surface of a crystal as they are revealed by changes in the curvature of the surface. The first experiments are being done with alkali atoms adsorbed on a Si(111) surface.

22959 (DOE/ER/13674–3) **Theoretical studies of electrons and electron transfer processes in fluids: Final progress report, February 1987–August 1989.** Kestner, N.R. Louisiana State Univ., Baton Rouge, LA (USA). Dept. of Chemistry. [1989]. 25p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-87ER13674. Order Number DE90008414. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Research accomplished during this grant involved studies of (1) Interaction of hydrated metal ions. Studies with accurate model potentials have demonstrated the distortion of hydration shells at high concentrations. (2) Water-water interactions and weak intermolecular forces. The Basis Set Superposition Error (BSSE) limits the accuracy of intermolecular potentials. (3) Negative polar clusters. We have developed the pseudopotential for ammonia with Landman and Jortner and have collaborated in published studies of negative ammonia clusters. (4) Density functional theory. A very large calculation on the iron dimer has been published; other work on the interaction of argon atoms has been completed. Work on CO_2, cobalt and the ionization potential of various transition metal ions has been completed. (5) Sodium water clusters. Our work on these clusters which have been observed experimentally in beams has been published. These may also be involved in photobleaching hydrated electrons. Collaborative work using path integral methods and Fast Fourier Transform methods are underway to obtain the excited states. (6) Propane interactions. In collaboration with Dr. S. Gupta we have studied the interaction of propane molecules and used these to evaluate its liquid properties. (7) Conducting polymers. Our work on the conformation of several conducting polymer fragments has been published.

22960 (DOE/ER/45125–T2) **Studies of the structure and properties of organic monolayers, multilayers and superlattices: Progress report, January 1987–January 1990.** Dutta, P.; Ketterson, J.B. Northwestern Univ., Evanston, IL (USA). Dept. of Physics and Astronomy. 1990. 29p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-84ER45125. Order Number DE90008330. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Organic monolayers and multilayers are both scientifically fascinating and technologically promising; they are, however, both complex systems and relatively inaccessible to experimental probes. In this progress report, we describe our x-ray diffraction studies, which have given us substantial new information about the structures and phase transitions in monolayers on the surface of water; our use of these monolayers as a unique probe of the dynamics of wetting and spreading; and our studies of monolayer mechanical properties using a simple but effective technique available to anyone using the Wilhelmy method to measure surface tension. 20 refs., 11 figs.

22961 (DOE/ER/45405–1) **The geometry of disorder: Report 1987–1990.** Henley, C.L. (Cornell Univ., Ithaca, NY (USA)). Boston Univ., MA (USA); Cornell Univ., Ithaca, NY (USA). [1990]. 25p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-89ER45405;FG02-87ER45323. Order Number DE90008250. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report is organized into four sections by topic. Each section and subsection has an introduction, followed by summaries of each publication. Summaries of works in progress, with expected completion by July 1, are included labeled by the item number in the list at the bottom of the publications list. This paper includes work on the geometry, i.e. how are structural units packed together in space, including the single most significant accomplishment under this grant: the development of the "random tiling" picture of quasicrystal ordering. This is followed by quasicrystal atomic structure (including work on quasicrystal faceting). Then I turn to random frustrated magnetic systems, where we have worked out ground state selection – "ordering due to disorder" – in some 2D model systems, and are currently studying the Wolff Monte Carlo algorithm. finally I summarize results on a new "self-organized percolation" model with a non-equilibrium dynamics representing "epidemics", "forest fires", or other self-catalytic reactions.

22962 (IPNO-T–88-01) **Experimental study on the secondary emission (atomic and molecular ions, aggregates, electrons) induced by the bombardment of surfaces by means of energetic heavy ions (≈ MeV/u). Effects of the charge state of the projectiles.** Monart, B. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire; Paris-7 Univ., 75 (France). May 1988. 160p. (In French). Order Number DE90756356. Available from NTIS (US Sales Only), PC A08/MF A01.

The ionic and electronic emissions, induced by the sputtering of solid targets (organic and inorganic) with 1 MeV/u projectiles. The time-of-flight spectrometry is applied to the secondary emission analysis. The projectile velocity, the angle of attack (between the beam and the target), and the projectile's incident charge state, are taken into account. It is shown that the secondary emission depends on the charge of the incident ion and on the charge state changement in the material's bulk. A model, applying the theoretical calculations concerning the charge in the material's bulk, is proposed. The existence of an interaction depth, for the incident ion and the material, which depends on the secondary ions type and on the incident ion charge, is suggested. The calculated depth is about 200 angstroms for the aggregates ejected from a CsI target, sputtered with $^{14}Kr^{18+}$. The H^+ yield (coming from ≈ 10 angstroms) is used as a projectile charge probe, at the material surface. The exprimental method allows, for the first time, the obtention of the equilibrium charge state in the condensed matter. The same method is applied to determine the non-equilibrium charges in the bulk of thin materials. The results show that, after leaving the material, the projectile presents a post-ionization state.

22963 (KURRI-TR–318, pp. 40-42) **Construction of an ion-trap for laser nuclear spectroscopy.** Fujioka, M. (Tohoku Univ., Sendai (Japan). Cyclotron and Radioisotope Center). Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst. May 1989. (In

Japanese). (CONF-8901177–: 1. specialist research meeting on studies of nuclear chemistry and nuclear physics at research reactor, Kumatori (Japan), 24-25 Jan 1989). 22965 (LBL–27522) **Absolute pressure dependence of the second ionization level of EL2 in GaAs.** Bliss, D.E.; Walukiewicz, W.; Nolte, D.D.; Haller, E.E. Lawrence Berkeley Lab., CA (USA). Nov 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-891119–104: Materials Research Society fall meeting, Boston, MA (USA), 27 Nov - 2 dec 1989). Order Number DE90007761. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We report the results of DLTS experiments under uniaxial stress on the second ionization level of EL2(++/+) in p-type GaAs. We measured the shift in the hole emission rate as a function of stress applied in the [100] and [110] directions. By modeling the valence band with two independently displacing bands and appropriately derived effective masses, we obtain a small absolute hydrostatic pressure derivative for the defect, 39 ± 15 MeV GPa^{-1}. The shear contribution is negligible. This result is very different than for the first ionization level, EL2(+/o) with a emission energy pressure derivative of 90 ± 15 MeV GPa^{-1}. The difference can be accounted for by the pressure dependence of the electron capture barrier of EL2(+/o), 49 ± 15 MeV GPa^{-1}. The absolute pressure derivatives of the two levels are then comparable and in good agreement with simple theory for Ga site point defects. 20 refs., 2 figs.

22966 (LYCEN-T–88-09) **Stimulated desorption induced by hydrogen aggregates (E $\leq$120 keV/u) and by heavy ions (E $\leq$ 400 keV/u). Analytical applications.** Oladipo, A. Lyon-1 Univ., 69 - Villeurbanne (France). Inst. de Physique Nucleaire. Mar 1988. 106p. (In French). Order Number DE90756360. Available from NTIS (US Sales Only), PC A06/MF A01.

This work presents an original group of results on stimulated desorption induced by H_n^+ clusters (n up to 61) at 600 keV on insulating samples. This phenomenom has been applied to surface microanalysis using both these particles and MeV argon ions. A time of flight spectrometer is used for the secondary ion detection. As far as clusters are concerned and for CsI material it is shown that the Cs^+ yield varies quadratically with the stopping power for these cluster, both above and below the BOHR velocity, v_0. Such a trend is based on a coherent interpretation of the role of collective and individual interactions leading to the energy deposit. The study of H^+ variation is not only in agrement with this interpretation but also gives some new informations on the interaction below v_0. As for the organic material, phenylalanine, we show the qualitative applicability of the model of intact molecule desorption from the periphery of the primary particle track. The high values of the measured ion yields (up to 100%), allows the use of low intensity ion beams using collimators of 2 μm diameter. The optimum lateral resolution has not been obtained with clusters due to technical limitations, but with the Ar ion irradiation system; a value of 10 μm has been obtained. On the other hand, marked differences have been observed between various alkali compounds, for which we make a tentative interpretation. Finally the evolution of desorption yields with the particle fluence constitutes an insight into the role played by the energy density on material modification under irradiation.

22967 (RAL–89-107) **High energy magnetic neutron scattering in heavy fermion compounds.** Osborn, R. (Rutherford Appleton Lab., Chilton (UK)); Taylor, A.D.; McEwen, K.A.; Goremychkin, E.A. Rutherford Appleton Lab., Chilton (UK). Sep 1989. 8p. (CONF-890953–: International conference on the physics of highly correlated electron systems, Santa Fe, NM (USA), 11-15 Sep 1989). Order Number DE90618499. Available from NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

To be published in Physica B.

High energy magnetic inelastic neutron scattering measurements of intermultiplet transitions in rare earth and actinide metals have established the importance of intra-atomic correlations even in the presence of strong hybridisation. Well defined transitions are observed up to an energy of 1766 meV in thulium metal. The $^3H_4 \rightarrow {}^3F_2$ transition is observed across the alloy series $U(Pd_{1-x}Pt_x)_3$, showing that localised $5f^2$ excitations persist in the heavy fermion compound UPt_3. The splitting of the spin-orbit transition in $CeAl_3$ suggests that hybridisation is an important component in the crystal field potential. (author).

22968 (UCRL–98747) **A unified integrated model for sputter coating uniformity.** Upadhye, R.S.; Hsieh, E.J. Lawrence Livermore National Lab., CA (USA). 9 Aug 1989. 10p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-891093–26: 36. American Vacuum Society national vacuum symposium, Boston, MA (USA), 23-27 Oct 1989). Order Number DE90008322. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The coating flux received by substrates in a sputter coating process consists of two components: the diffusive flux, contributed by fully thermalized atoms, and the directed flux, contributed by atoms which have retained a major part of their original velocity (i.e., both speed and direction). Near the source, the directed flux prevails, whereas far away from the source, the diffusive flux dominates. The sputtered source atoms undergo collisions with the inert gas atoms and become thermalized. The fraction of thermalized atoms increases with distance from the source, and so does the diffusive component of the net flux. The two different process mechanisms have often been modeled separately. Such models work only in the extremes, and are not useful in situations where both mechanisms contribute significantly. We have developed an integrated model of the process which assigns weights to the two mechanisms; the weighting factors are then related to the process and equipment parameters. 5 refs., 2 figs.

22969 **Fluctuating interfaces: A series of synchrotron x-ray scattering of interacting stacked membranes.** . Safinya, C.R. (Exxon Research and Engineering Co., Annandale, NJ (US)). pp. 304 of Synchrotron radiation in materials research. Clark, R.; Gland, J.; Weaver, J.H. Materials Research Society, Pittsburgh, PA (1989). (CONF-8811224–: Synchrotron radiation in materials research, Boston, MA (USA), 28-30 Nov 1988).

In this paper the authors concentrate on fluctuation phenomena encountered in interacting multilayered fluid membranes using synchrotron x-ray scattering as the primary tool. These systems consisting of surfactant or lipidic surfaces, are prototype models for understanding the statistical behavior of fluctuating surfaces embedded in three-dimensions. In elucidating the nature of fluid membranes they stress a unique intrinsic property: in contrast to usual surfaces with finite shear moduli, where surface tension plays a central role, the free energy of these essentially tensionless surfaces is governed by their geometrical shape and its fluctuations. They present data in a new regime of stability for very dilute and flexible membranes with interlayer separations of order hundreds of angstroms. This is in contrast to most rigid membranes where the interlayer interactions are dominated by detailed microscopic interactions such as hydration and van der Waals.

They show that the stability of these dilute lamellar phases is associated with violent out-of-plane fluctuations of the membranes giving rise to an effectively large long-range repulsive interaction. Because of its entropic origin, this interaction is universal and the authors present data for two different surfactant systems. They show that this new regime is distinct from the classical regime in which largely separated membrane sheets are stabilized because of their mutual electrostatic repulsion.

22970 **Studies of an InAs/GaAs heterojunction by total-electron-yield.** Krol, A. (Dept. of Physics, State Univ. of New York at Stony Brook, Stony Brook, NY (US)); Sher, C.J.; Storch, D.R.; Woronick, S.C.; Krebs, L.; Kao, Y.H.; Chang, L.L. pp. 304 of Synchrotron radiation in materials research. Clark, R.; Gland, J.; Weaver, J.H. Materials Research Society, Pittsburgh, PA (1989). (CONF-8811224–: Synchrotron radiation in materials research, Boston, MA (USA), 28-30 Nov 1988).

Total electron yield (TEY) of an InAs/GaAs heterojunction due to soft x-ray excitation has been studied. This heterojunction was prepared by an overgrowth of a 600 A InAs layer on a GaAs substrate using molecular beam epitaxy. In this paper, experimental data are compared with theoretical analysis based on a modified Fresnel formulation to calculate the wave field distribution in stratified media with interfacial roughness. The TEY angular profiles obtained at a given x-ray energy reveal information on the interfacial roughness, secondary electron escape length, attenuation length of elastically scattered photo-electrons, and optical constants of the epilayer in the x-ray regime.

22971 (AD-A–214681/9/XAB) **Electronically induced phase transformations. Final report, 1 October 1975-30 September 1980.** Freeman, A.J. Northwestern Univ., Evanston, IL (USA). Dept. of Physics and Astronomy. Dec 1980. 71p. Available from NTIS, PC A04/MF A01.

The electronic interactions responsible for the observed electronically induced phase transformations in several important classes of materials were investigated theoretically in close collaboration with experimental programs at other institutions. These include destruction of superconductivity and onset of a normal magnetic state at low temperatures in ternary rare-earth superconducting compounds and the possible occurrence of a new mixed phase, the origin of the phase transition to the superconducting phase in the Chevrel compounds, the possibility of excitonic superconductivity in CuCl, and the origin of phonons.

22972 (LBL–27461) **High resolution transmission electron microscopy study of defect structures in mixed-phase YBaCuO.** Fendorf, M.; Kvam, E.; Gronsky, R. Lawrence Berkeley Lab., CA (USA). Dec 1989. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-891119–103: Materials Research Society fall meeting, Boston, MA (USA), 27 Nov - 2 dec 1989). Order Number DE90007767. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Mixed-phase superconducting YBaCuO is characterized by means of high-resolution transmission electron microscopy. This technique reveals that such material contains numerous crystallographic defects of various types. Several of these are described in detail, and their origins discussed. 7 refs., 6 figs.

22973 (UCRL–101287) **The electronic properties of high T_c superconductors probed by positron annihilation.** Sundar, C.S. (Missouri Univ., Kansas City, MO (USA)); Bharathi, A.; Jean, Y.C.; Hinks, D.G.; Dabrowski, B.; Zheng, Y.; Mitchell, A.W.; Ho, J.C.; Howell, R.H.; Wachs, A.L. Lawrence Livermore National Lab., CA (USA). 23 Jun 1989. 4p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-890718–34: International conference on materials and mechanisms of superconductivity - high-temperature superconductors II, Stanford, CA (USA), 23-28 Jul 1989). Order Number DE90008354. Available from NTIS, PC A02/MF A01 - OSTI.

The discovery of superconductivity at 30K in $Ba_{.6}K_{.4}$ BiO_3 has generated considerable excitement in view of the contrasting properties of the Ba-K-Bi-O system when compared to the well known Cu-O based high temperature superconductors. Positron annihilation spectroscopy, which is a sensitive local probe of the electronic and defect properties of a solid, has been extensively applied in the study of Cu-O based superconductors. In the present paper, the results of positron lifetime as a function of temperature in Ba-K-Bi-O are presented and compared with the known results in the cuprate superconductors. Plausible reasons for the observed temperature dependence of positron lifetime are presented. 7 refs., 2 figs.

22974 **Polarized x-ray absorption studies of oxide superconductors.** Ercan Alp, E. (Argonne National Lab., Argonne, IL (US)); Mini, S.M.; Ramanathan, M.; Veal, B.W.; Soderholm, L.; Goodman, G.L.; Dabrowski, B.; Shenoy, G.K.; Guo, J.; Ellis, D.E. pp. 304 of Synchrotron radiation in materials research. Clark, R.; Gland, J.; Weaver, J.H. Materials Research Society, Pittsburgh, PA (1989). DOE Contract W-31-109-ENG-38. (CONF-8811224–: Synchrotron radiation in materials research, Boston, MA (USA), 28-30 Nov 1988).

Polarized x-ray absorption studies have been carried out at the Cu K-edge to study the effect of Sr doping in La_2CuO_4 and oxygen doping in Y $Ba_2Cu_3O_6$+x. These measurements help to elucidate the transitions giving rise to the absorption edges. The authors offer an explanation of the polarization shifts of features in terms of the results of their embedded cluster calculations of electronic structure.

22975 (CEA-CONF–9806) **Transition to turbulence via spatiotemporal intermittency.** Chate, H.; Manneville, P. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Fondamentale (IRF). 1988. 5p. (CONF-8808294–: YKIS'88, Kyoto (Japan), 22-26 Aug 1988). Order Number DE90756434. Available from NTIS (US Sales Only), PC A02/MF A01.

The transition to turbulence via spatiotemporal intermittency for weakly confined systems is studied. Purely stochastic models, in terms of probabilistic cellular automata (as close as possible to the qualitative behaviour of the coupled map lattices), allow the development of a standard mean-field approximation. The presence of defects is considered to explain the evolution of the laminar phase. Results indicate a discontinuous transition when the connectivity is low (2 neighbors) and that the turbulent regime is hardly observable for higher neighbor number. The data interpretation is based on the usual concepts of thermodynamic phase transitions and standard statistical mechanics.

22976 (CONF-8906270–2) **The basis spline method and associated techniques.** Bottcher, C.; Strayer, M.R. Oak Ridge National Lab., TN (USA). 1989. 25p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Summer school of computational atomic and nuclear physics; Sewanee, TN (USA); 26 Jun - 7 jul 1989. Order Number DE90008403. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

We outline the Basis Spline and Collocation methods for the solution of Partial Differential Equations. Particular attention is paid to the theory of errors, and the handling of non-self-adjoint problems which are generated by the collocation method. We discuss applications to Poisson's equation, the Dirac equation, and the calculation of bound and continuum states of atomic and nuclear systems. 12 refs., 6 figs.

22977 (GSI–89-86(prepr.)) **Fermionic molecular dynamics.** Feldmeier, H. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany, F.R.). Dec 1989. 26p. Available from Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany, F.R.). Available from Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany, F.R.).

A new type of molecular dynamics is proposed to solve approximately the many-body problem of interacting identical fermions with spin 1/2. The interacting system is represented by an antisymmetrized many-body wave function consisting of single-particle

states which are localized in phase space. The equations of motion for the parameters characterizing the many-body state (e.g. positions, momenta and spin of the particles) are derived from a quantum variational principle. The proposed Fermionic Molecular Dynamics (FMD) model is illustrated with help of two examples. (orig.).

22978 (K/CSD/TM–90) **Area Over Length (AOL): A program for the calculation of effective two-dimensional thermal conductance through an arbitrarily shaped region.** Wendel, M.W. Oak Ridge Gaseous Diffusion Plant, TN (USA). Feb 1990. 31p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OT21400. Order Number DE90008005. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A computer program, Area Over Length (AOL), has been developed to solve for the effective thermal conductance between two isothermal surfaces through a region or arbitrary shape. It is based on a boundary integral method that is derived using complex variables. It is especially useful as an aid to finite-difference and finite-element modeling of irregularly shaped regions. The theory behind AOL applies to the linear solution of any two-dimensional, steady state heat conduction problem without holes in the computational domain. However, AOL has been developed for the specific case in which the boundary consists of four pieces: two opposing isothermal pieces and two opposing adiabatic pieces. This case applies when the effective thermal conductance of a heat flow path between two nodes in a discretization of a larger domain is desired. The program requires that the user supply a boundary discretization of the region across which heat transfer occurs. Also, the points in the boundary discretization that separate the pieces of the boundary must be indicated. A sample problem is discussed. 4 refs., 10 figs.

22979 (ORNL/TM–11468) **Periodic trajectories for two-dimensional nonintegrable Hamiltonians.** Davies, K.T.R. Oak Ridge National Lab., TN (USA). Feb 1990. 75p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. (CONF-900176–1: ORNL chaos workshop, Oak Ridge, TN (USA), 10-11 Jan 1990). Order Number DE90008082. Available from NTIS, PC A04/MF A01; OSTI; INIS; GPO Dep.

I want to report on some calculations of classical periodic trajectories in a two-dimensional nonintegrable potential. After a brief introduction, I will present some details of the theory. The main part of this report will be devoted to showing pictures of the various families of trajectories and to discussing the topology (in E-τ space) and branching behavior of these families. Then I will demonstrate the connection between periodic trajectories and "nearby" nonperiodic trajectories, which nicely illustrates the relationship of this work to chaos. Finally, I will discuss very briefly how periodic trajectories can be used to calculate tori. 12 refs., 40 figs.

22980 (SLAC-PUB–5189) **A finite Zitterbewegung model for relativistic quantum mechanics.** Noyes, H.P. Stanford Linear Accelerator Center, Menlo Park, CA (USA). 19 Feb 1990. 48p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-900299–1: 6. annual west coast meeting of the Alternative Natural Philosophy Association, Stanford, CA (USA), 10-11 Feb 1990). Order Number DE90008031. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Starting from steps of length $\hbar/mc$ and time intervals $\hbar/mc^2$, which imply a quasi-local Zitterbewegung with velocity steps $\pm c$, we employ discrimination between bit-strings of finite length to construct a necessary 3+1 dimensional event-space for relativistic quantum mechanics. By using the combinatorial hierarchy to label the strings, we provide a successful start on constructing the coupling constants and mass ratios implied by the scheme. Agreement with experiments is surprisingly accurate. 22 refs., 1 fig.

22981 (UCID–21793) **Efficient, high order solution technique for the Liouville equation.** Sacks, R.; Shore, B.; Hermann, M.; Dixit, S. Lawrence Livermore National Lab., CA (USA). 23 Feb 1988. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90008060. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

In constructing a time-dependent model of the propagation of high intensity, multifrequency light through a Raman active medium, it is necessary to solve the Liouville equation for the time evolution of the density matrix. This paper discusses the high order solution technique of this equation in a constant-field-envelope case. 2 refs.

22982 (CONF-8910313–3) **A search for neutrons and gamma rays associated with tritium production in deuterated metals.** Wolf, K.L.; Lawson, D.R.; Packham, N.J.C.; Wass, J.C. Texas A and M Univ., College Station, TX (USA). 1989. 15p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-88ER40437;FG05-86ER40256. From NSF/EPRI workshop on anomalous effects in deuterated materials; Washington, DC (USA); 16-18 Oct 1989. Order Number DE90007641. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Tritium activity has been measured in several Pd-Ni-D_2O electrolytic cells, as reported previously. At the present time 13 separate cells have shown tritium at 10^2 to 10^6 times the background level of the D_2O used in these experiments. The appearance of the activity in the electrolyte and in the gas phase occurs over a period of hours to a few days after remaining at or near the background level during 4–10 weeks of charging in 0.1 M LiOD, D_2O solution. The present paper deals with attempts to reproduce the tritium measurements and to establish the source, from either contamination or nuclear reaction. The sudden appearance of tritium activity in the cells requires the tritium to be loaded in a component prior to the beginning of cell operation in a contamination model. Release is assumed to be caused by deterioration of one of the materials used in the 0.1 M LiOD solution. In an extensive set of tests, no contamination has been found in the starting materials or in normal water blanks. Results for neutron and gamma-ray correlations have proved to be negative also. The limit set on the absence of 2.5 MeV neutrons for the t/n ration is 10^7 from that expected in the d + d reaction, and 10^3 for 14 MeV neutrons expected from the t + d secondary reaction. Similarly, Coulomb excitation gamma rays expected from the interaction of 3 MeV protons with Pd are found to be absent, which indicates that the d(d,p)t two-body reaction does not occur in the Pd electrode. 9 figs., 2 tabs.

22983 Angular-momentum limitations in heavy ion-induced fusion reactions leading to ^{40}Ca and ^{42}Ca. Harmon, B.A. Thesis (Ph. D.). 219p. Univ. of Virginia, Charlottesville, VA (US) (1987). Available from University Microfilms, PO Box 1764, Ann Arbor, MI 48106, Order No.89-01,231.

Cross sections for the fusion of ^{28}Si + ^{12}C from 4.6 to 9.4 MeV/nucleon and ^{30}Si + ^{12}C from 5.2 to 8.3 MeV/nucleon have been measured. The bombarding energy covered in these experiments extends from the intermediate to high energy regimes of the fusion excitation function where the fusion cross section is known for most heavy ion-induced reactions to be decreasing. The decrease in the high energy fusion cross section is understood to be caused by a limitation imposed on the fusing system by the maximum angular momentum (l_{cr}) the system can sustain. The mechanisms which determine the l_{cr} for a particular projectile-target combination, or entrance channel, are however, not understood. It has been found that the characteristics of the entrance channel, rather than those of the compound nuclei ^{40}Ca and ^{42}Ca, determine the l_{cr} for the ^{28}Si + ^{12}C and ^{30}Si + ^{12}C systems, respectively. The experiments were carried out with the time of flight apparatus at the Holifield Heavy Ion Research Facility at Oak Ridge National Laboratory. Beams of ^{28}Si and ^{30}Si ions were used to bombard ^{12}C targets and complete or partial angular distributions for the heavy reaction products with atomic numbers from 24 to 40 were obtained at 6.4, 7.8, and 9.4 MeV/nucleon for ^{28}Si + ^{12}C and 5.2, 5.7, 6.4, 7.5, and 8.3 MeV/nucleon for ^{30}Si + ^{12}C. Charge and mass identification, combined with a kinematic analysis of the velocity distributions for individual isotopes, allowed separation of the yields from compound nucleus evaporation residues and nonfusion processes.

22984 (CEA-CONF–9533) **Stimulated Raman scattering and ion dynamics: the role of Langmuir wave non-linearities.** Bonnaud, G.; Pesme, D. CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France). 1987. 25p. (CONF-8711338–: 8. workshop on laser interaction and related plasma, San Diego, CA (USA), 2-6 Nov 1987). Order Number DE90756448. Available from NTIS (US Sales Only), PC A03/MF A01.

The saturation of the Stimulated Raman Scattering (SRS) is studied by means of wave-coupling numerical simulations. A new code (CHEOPS) has been designed in order to model these couplings, in real 1-D space, with aperiodic boundary conditions. Each wave can be represented either by a complete amplitude or by an envelope amplitude only. The choice of the wave set to be coupled allows to investigate separately some mechanisms relevant in long time SRS evolution. The various mechanisms which may inhibit SRS growth are reviewed and the SRS saturation scenarios are exhibited in an homogeneous density plasma slab. The ion dependent mechanisms appear to be the most efficient ones to saturate SRS. Their importance is strongly bound to the electron temperature and to the ion fluctuation level at time when SRS has already grown many e-foldings.

22985 (CEA-CONF–9534) **Density and temperature diagnostics of a Ne-like germanium plasma created by laser.** Berthier, E.; Bourgade, J.L.; Combis, P.; Jacquemot, S.; Le Breton, J.P.; Louis-Jacquet, M.; Naccache, D.; Nail, M.; Peyrusse, O. CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France). 1987. 4p. (CONF-8709143–:). Order Number DE90756449. Available from NTIS (US Sales Only), PC A02/MF A01.

In the framework of X-ray laser studies, experiments on Ne-like Ge plasma have been performed by laser irradiation at $\lambda = 1.053$ μm. Amplification in lasing transitions has been observed by varying the plasma length. Theoretical calculations of excited level population allow us to determine density and temperature from line intensity ratios.

22986 (CEA-CONF–9535) **High resolution soft X-Ray spectrometer with 5-picosecond time-resolution for laser-produced plasma diagnostics.** Mexmain, J.M. (CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (FR)); Bourgade, J.L.; Louis-Jacquet, M.; Mascureau, J. de; Sauneuf, R.; Schwob, J.L. CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France). 1987. 5p. (CONF-8709143–:). Order Number DE90756403. Available from NTIS (US Sales Only), PC A02/MF A01.

A new XUV spectrometer designed to have a time-resolution of 3 ps and a spectral resolution of 0.1 A is described. It is basically a modified version of a Schwob-Fraenkel spectrometer, which is coupled to a new ultrafast electronic streak camera.

22987 (CONF-900174–1-Vugraphs) **High elongation plasmas.** Lazarus, E.A. Oak Ridge National Lab., TN (USA). [1990]. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. This paper contains viewgraphs on axisymmetric stability of doublet-3 tokamak. The information available on this stability is applied to the Compact Ignition Tokamak. (LSP)

22988 (CONF-900288–4) **Difference in electron thermal diffusivity and profile between interior and exterior of TFTR L-mode plasmas.** Hiroe, S. (Oak Ridge National Lab., TN (USA)); Johnson, D.W.; Goldston, R.J. Oak Ridge National Lab., TN (USA). [1990]. 32p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 2. transport task force workshop; Hilton Head, SC (USA); 19-23 Feb 1990. Order Number DE90007479. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The local properties such as scale lengths of the electron density (L_{n_e}), temperature (L_{T_e}), and pressure (L_{p_e}), and the electron thermal diffusivity $\chi_e(r)$ (m^2/s) for $r/a > 0.3$ have been studied for TFTR L-mode discharges under the assumption of $\chi_e = \chi_i$. The scale lengths and the electron thermal diffusivity in the interior $0.3 < r/a < 0.55$ are significantly different from those on the exterior $0.55 < r/a < 0.8$. following are some examples (temperatures in keV, other quantities in MKS units). In the interior ($0.3 < r/a < 0.55$), most of the scale lengths were constant or a weakly dependent on radius, and χ_e can be expressed as (with correlation coefficient R = 0.61), $\chi_e(r) = 1.44 \times 10^{18}(r/a)^{1.0}T_e(r)^{0.1}q(r)^{0.1}/n_e^{0.9}(r)$. In the exterior region ($0.55 < r/a < 0.8$), the scale lengths decrease monotonically, and χ_e can be described as (with R = 0.68), $\chi_e(r) = 2.3 \times 10^3(r/a)^{1.7}T_e(r)^{0.7}q(r)^{0.8}/n_e^{0.2}(r)$. It is interesting to note the negative n_e dependence of χ_e in the interior and the positive T_e dependence of χ_e in the exterior.

22989 (DOE/ET/51013–276) **CIT burn control using auxiliary power modulation.** Chaniotakis, E.A.; Freidberg, J.P.; Cohn, D.R. Massachusetts Inst. of Tech., Cambridge, MA (USA). Plasma Fusion Center. 29 Sep 1989. 72p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-78ET51013. (PFC/RR–89-16). Order Number DE90007640. Available from NTIS, PC A04/MF A01; OSTI; INIS; GPO Dep.

It is predicted that ignited tokamaks such as CIT will experience a thermal instability. In this work a zero dimensional transport model is used as a means of examining this thermal instability. In order to solve the problems associated with the uncertainty in predicting the behavior of an ignited tokamak plasma, auxiliary power may be used for mapping the tokamak operating space, both in the low temperature stable regime and in the high temperature unstable regime. Auxiliary power modulation as a means of burn control is the most reliable method, especially during the initial stages of CIT operation. By modulating the auxiliary power stable thermal equilibria can be created at relatively high values of Q (~65). 20 refs., 28 figs.

22990 (DOE/ET/51013–278) **Measurements on injected impurity transport in TEXT [Texas Experimental Tokamak] using multiply filtered soft x-ray detectors.** Wenzel, K.W. Massachusetts Inst. of Tech., Cambridge, MA (USA). Plasma Fusion Center. Jan 1990. 234p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-78ET51013. (PFC/RR–90-1). Order Number DE90007638. Available from NTIS, PC A11/MF A01; OSTI; INIS; GPO Dep.

Aluminum was injected into TEXT to study trace, non-recycling impurity transport. A 92-channel, three array x-ray imaging system was constructed and installed to measure temporally-resolved density profiles of the three highest charge states. A novel krypton filter in one array discriminated between the He-like and H-like resonance lines, and a hard filter responded mostly to the fully stripped charge state. The impurity confinement time scaled approximately as $\tau_c \sim \bar{n}_e Z_{eff}\sqrt{m_i}/Z_i I_p$ (i denotes the background gas). Aluminum density profiles averaged over a sawtooth crashes were also measured for a few discharges. Sawteeth strongly enhanced the inward impurity flow immediately following injection, when the density was still peaked near the plasma edge. Those discharges with the longest sawtooth period obtained the most peaked aluminum density profiles; thus sawteeth were also important in ameliorating impurity accumulation on the tokamak axis. The charge state balance of the aluminum ions obtained from the measured profiles was compared to predictions of coronal equilibrium. Somewhat surprisingly the aluminum ions were close to coronal, except in those discharges with very short sawtooth periods or very large inversion radii. Preliminary evidence of up-down asymmetric density profiles was also found. Numerical simulations of aluminum transport were performed. The effect of sawtooth oscillations was taken into account with a simple flattening model. The data disagreed with a constant D anomalous model except in the plasma center; enhanced outward transport was required. The experiments did not agree with neoclassical simulations, because the theory had outward convection that was too large. 237 refs., 86 figs., 8 tabs.

22991 (DOE/ET/51013–279) **TSC [Tokamak Simulation Code] simulations of Alcator C-MOD discharges II: Single**

X-point, vertically asymmetric scenario. Ramos, J.J. Massachusetts Inst. of Tech., Cambridge, MA (USA). Plasma Fusion Center. Jan 1990. 40p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-78ET51013. (PFC/RR–90-2). Order Number DE90007639. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A simulation of a single X-point diverted discharge of the Alcator C-MOD tokamak is carried out using the Tokamak Simulation Code (TSC). 2 refs., 31 figs., 1 tab.

22992 (EUR-CEA-FC–1345) **A conceptual steady-state tokamak reactor with passive current generation.** Johner, J.; Fidone, I. Association Euratom-CEA, Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee. May 1988. 36p. Available from NTIS (US Sales Only), PC A03/MF A01.

Current generation in a tokamak reactor using synchrotron radiation and the bootstrap effect is considered. It is found that for sufficiently high temperatures, the total current generated by these passive drivers is sufficient to allow continuous operation with parameters satisfying the density and beta limitations as well as the thermal balance requirements.

22993 (EUR-CEA-FC–1355) **Variational calculation of electromagnetic instabilities in tokamaks.** Garbet, X.; Laurent, L.; Mourgues, F.; Roubin, J.P.; Samain, A. Association Euratom-CEA, Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee. Aug 1988. 32p. Available from NTIS (US Sales Only), PC A03/MF A01.

A variational method is presented in order to determine and study linear microinstabilities in tokamaks. Exploiting the existence of a system of action and angular variables for trapped and circulating particles, a functional, extremum in the turbulent electromagnetic field, is analytically established and implemented in the code TORRID. The coupling of poloidal harmonics due to toroidal effects is investigated within the frame of a WKB formalism whose zeroth order is equivalent to the ballooning analysis. The essential features of the code TORRID are described. Curvature effects on ionic modes profiles and stability thresholds are presented as an example of application.

22994 (EUR-CEA-FC–1360) **Dynamical systems in plasma theory.** Maschke, E.K. Association Euratom-CEA, Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee. Nov 1988. 15p. Available from NTIS (US Sales Only), PC A03/MF A01.

After a short introduction into the theoretical description of magnetically confined plasmas, typical dynamical systems describing plasma phenomena are discussed.

22995 (EUR-CEA-FC–1365) **Turbulence associated with the sawtooth internal disruption.** Andreoletti, J. (Association Euratom-CEA, Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-lez-Durance (France)—Dept. de Recherches sur la Fusion Controlee (France)); Laviron, C.; Olivain, J.; Pecquet, A.L.; Gervais, F.; Gresillon, D.; Hennequin, PAssociation Euratom-CEA, Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee. May 1989. 41p. Available from NTIS (US Sales Only), PC A03/MF A01.

Specific turbulence associated with the sawtooth internal disruption has been observed on TFR tokamak plasmas by analyzing density fluctuations with CO_2 laser light scattering. The time localization is clearly connected with the successive phases of the relaxation process. Some specific turbulence appears in relation to the kink motion, but the main burst corresponds to the collapse phase. We concentrate our study on this strong burst and show first its frequency and wave number spectral properties and the corresponding pseudo dispersion relation. The specific turbulence is spatially localized. It is within the interior of the q = 1 surface and extends approximately 120^0 azimuthally. Taking into account the twisting of the central plasma during the turbulent kink phase, this location agrees with the azimuthal position of the "sooner and faster" outgoing heat flux. The power level of this turbulence is two orders of magnitude larger than the local quasi-stationary turbulence. These observations are in fair agreement with the predictions of the sawtooth disruption model previously proposed by Andreoletti. The observed specific turbulence shows several similarities with the so called "magnetodrift turbulence" described in the model.

22996 (FRCEA-TH–169) **Interaction of a beam of heavy ions with a CO_2 laser produced plasma. Fitting of an ionographic tube and simulation of the experiment.** Guihaume, J.M. Paris-11 Univ., 91 - Orsay (France); CEA Centre d'Etudes de Bruyeres-le-Chatel, 91 (France). 1986. 192p. (In French). Order Number DE90756433. Available from NTIS (US Sales Only), PC A09/MF A01.

The experimental device and methods, applied in the obtention of the first experimental results from the interaction between a heavy ions beam and a plasma, are described. The charge, energy and spatial distributions of the burst of heavy ions, after its passage the coronal plasma, are obtained. The burst of heavy ions is produced by means of a 7 MV tandem accelerator, and the plasma is obtained by means of two CO_2 laser beams: (1) the charge distribution of the burst of ions, coming out of the plasma, is a Gaussian function; (2) the mean charge of the burst of ions, coming out of the plasma, increases with the ionization state and the electron density of the plasma, as well as with the energy of the incident ions; (3) the energy loss becomes important for unidirectional electron densities higher than 5.10^{-18} cm^{-2}.

22997 (FRNC-TH–3348) **Study and development of different techniques for the generation, conversion, propagation, and radiation of high power microwaves for the electronic cyclotron frequency plasma heating.** Rebuffi, L. Paris-11 Univ., 91 - Orsay (France); Association Euratom-CEA, Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Recherches sur la Fusion Controlee. Oct 1987. 124p. (In French). Order Number DE90756363. Available from NTIS (US Sales Only), PC A06/MF A01.

The development and optimization of a microwave technique, concerning the high frequency (electronic cyclotron frequency) plasma heating is presented. The experiments are effectuated on the Fontenay-aux-Roses TFR tokamak, with 660 kw whole power, during 100 msec, produced at 60 GHz. Low power tests are performed on the different transmission line components (there are 3, formed by metallic circular waveguides). The work also includes: the development of a lens formed by thin metallic plans; the study of slotted surface mirror; the development of a system for the accurate measurement (5.10^{-6}) of the gyrotronic frequency; a theory, based on the equivalent circuits method, generalized to the rotational and polarization mirrors; the development of a numerical simulation code. A practical scheme, for the optimization of the parameters concerning the optical transmission line project, is given. The results of this work can be applied to the experiment involving power levels, frequencies and times of impulsion increasingly higher (respectively about MW, 100 GHz and 10s) than the reported ones. Moreover, they can also be used in any experiment in the microwave field.

22998 (IAEA-TECDOC–536) **Impurity control in toroidal devices: Proceedings of a technical committee meeting held in Naka-Gun, Japan, 13-15 February 1989.** International Atomic Energy Agency, Vienna (Austria). Jan 1990. 173p. (CONF-8902101–: IAEA technical committee meeting on impurity control, Naka (Japan), 13-15 Feb 1989). Order Number DE90618585. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

This summary report on the Technical Committee Meeting organized by the IAEA and held in Naka-Gun, Japan, 13-15 February 1989, provides an overview of the results presented. Of the twenty-three papers presented, sixteen were devoted to tokamak experiments. These presented data of plasma behavior in the scrape-off layer and divertor regions, as well as effects of impurities on the core plasma; these are summarized here. Other papers summarized deal with plasma-wall interactions, including wall material behavior. Still others deal with theoretical work on physics modelling in the edge region. Refs, figs and tabs.

22999 (IAEA-TECDOC–536, pp. 23-29) **Edge phenomena of JFT-2M plasma.** Ohtsuka, H. (Japan Atomic Energy Research

Inst., Tokai, Ibaraki (Japan). Dept. of Thermonuclear Fusion Research). JFT-2M Group. International Atomic Energy Agency, Vienna (Austria). Jan 1990. (CONF-8902101–: IAEA technical committee meeting on impurity control, Naka (Japan), 13-15 Feb 1989). In *Impurity control in toroidal devices: Proceedings of a technical committee meeting held in Naka-Gun, Japan, 13-15 February 1989.* Order Number DE90618585. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

During these several years we have been looking for dc-type ExB convection to which we can attribute a cause of anomalous transport in the tokamak edge region. We report here the present status of the research. First, we show limiter induced convection. We observed that in the plasma-limiter contact area there occurs convection of the plasma in the radial direction. The mechanism that induce such convection is discussed. Second, we show that fast wave (FW) injection modifies density pattern in the edge. From the dependence on the magnetic field, we draw a mechanism that is responsible for the production of such a flow pattern. Last, we present plasma response in the scrape-off layer to ICH injection. Floating potential measurement shows it is very probable that ICH injection also produces convection in the scrape-off-layer. From these observations we draw conclusions putting an emphasis on localized disturbance in the plasma. (author). 7 figs, 1 tab.

23000 (IAEA-TECDOC–536, pp. 31-36) **Current drive and particle control by divertor biasing.** Shimada, M. (Japan Atomic Energy Research Inst. (Japan)); Stambauch, R.D.; Mahdavi, M.A.; Schaffer, M.; Staebler, G.; Hinton, F. International Atomic Energy Agency, Vienna (Austria). Jan 1990. Contract DE-AC03-84ER51044. (CONF-8902101–: IAEA technical committee meeting on impurity control, Naka (Japan), 13-15 Feb 1989). In *Impurity control in toroidal devices: Proceedings of a technical committee meeting held in Naka-Gun, Japan, 13-15 February 1989.* Order Number DE90618585. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

Uncontrollable density build-up and impurity accumulation are major problems of ELM-free H-mode discharges. Here we discuss a possibility of particle control by divertor bias. The idea is to electrically insulate divertor plates and apply voltage between the divertor plates on inside and those on outside. Current in the scrape-off layer flows along the field line, which provides a simple non-inductive current drive. The resistive drop will create poloidal electric field, which induce outward particle flux when scrape-off layer current is in the direction of the plasma current. (author). 5 refs, 5 figs, 1 tab.

23001 (IAEA-TECDOC–536, pp. 37-42) **Impurity production and recycling in JET.** De Kock, L. (Commission of the European Communities, Abingdon (UK). JET Joint Undertaking); Bures, M.; Clement, S. JET Team. International Atomic Energy Agency, Vienna (Austria). Jan 1990. (CONF-8902101–: IAEA technical committee meeting on impurity control, Naka (Japan), 13-15 Feb 1989). In *Impurity control in toroidal devices: Proceedings of a technical committee meeting held in Naka-Gun, Japan, 13-15 February 1989.* Order Number DE90618585. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

Scrape-off plasma parameters in RF heated JET discharges are reported. At very high additional heating power it is observed that a strongly increased carbon influx can occur leading to a sharp decrease of the measured DD neutron reaction rate. This paper describes also the progress made in studying wall pumping and recycling. (author). 13 refs, 7 figs.

23002 (IAEA-TECDOC–536, pp. 43-48) **Scaling study of scrape-off layer and divertor plasmas.** Itoh, S.I. (Hiroshima Univ. (Japan). Inst. for Fusion Theory); Ueda, N.; Itoh, K. International Atomic Energy Agency, Vienna (Austria). Jan 1990. (CONF-8902101–: IAEA technical committee meeting on impurity control, Naka (Japan), 13-15 Feb 1989). In *Impurity control in toroidal devices: Proceedings of a technical committee meeting held in Naka-Gun, Japan, 13-15 February 1989.* Order Number DE90618585. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

2D time dependent transfer code UEDA has been applied to the single-null divertor plasma in JFT-2M tokamak in order to study the transport of scrape-off layer plasma. The parameter dependencies of the edge density temperature as well as the temporal evolution and transient response was evaluated. From the point of view of an impurity source from the divertor plate, the discovered transient peak on the ion temperature could play a sufficient role in the transport phenomena. (author). 16 refs, 4 figs.

23003 (IAEA-TECDOC–536, pp. 61-66) **Impurity transport at arbitrary concentration in the divertor plasma.** Igitkhanov, Yu.L. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Inst. Atomnoj Ehnergii). International Atomic Energy Agency, Vienna (Austria). Jan 1990. (CONF-8902101–: IAEA technical committee meeting on impurity control, Naka (Japan), 13-15 Feb 1989). In *Impurity control in toroidal devices: Proceedings of a technical committee meeting held in Naka-Gun, Japan, 13-15 February 1989.* Order Number DE90618585. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

This paper describes a new model for impurity transport in the scrape-off plasma layer. It has shown that under the condition of high impurity concentration they could play an important role in the transport phenomena. The impurity ions of an arbitrary concentration was taken into account and the main results of the analysis could be formulated in the following ways: (1) outside the recycling zone near the divertor plate the ion thermal force plays a decisive and unfavourable role in the distribution of highly-ionized impurities, (2) in the recycling region the favourable drag force is stronger than the thermal force and provides a good divertor retention. (author). 5 refs, 2 figs.

23004 (IAEA-TECDOC–536, pp. 55-60) **First wall and divertor plate sputtering in a tokamak reactor.** Abramov, V.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Inst. Atomnoj Ehnergii); Igitkhanov, Yu.L.; Pistunovich, V.I.; Pozharov, V.A. International Atomic Energy Agency, Vienna (Austria). Jan 1990. (CONF-8902101–: IAEA technical committee meeting on impurity control, Naka (Japan), 13-15 Feb 1989). In *Impurity control in toroidal devices: Proceedings of a technical committee meeting held in Naka-Gun, Japan, 13-15 February 1989.* Order Number DE90618585. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

The paper contains results of theoretical analyses of erosion of first wall and divertor plates for plasma facing components in a future tokamak-reactor. The calculations have been performed under the conditions of sufficient energy distribution function distortions and the angular dependence of the sputtering yield taken into account. The obtained data show that the distribution function distortion leads to the sputtering yield increases by a factor of 2 which is comparable with one due to the angular effect. (author). 3 refs, 1 fig., 2 tabs.

23005 (IAEA-TECDOC–536, pp. 67-73) **Heat flow to the divertor plates in JT-60 lower X-point discharges.** Itami, K. (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Nishitani, T.; Hosogane, N.; Matoba, T. JT-60 Team. International Atomic Energy Agency, Vienna (Austria). Jan 1990. (CONF-8902101–: IAEA technical committee meeting on impurity control, Naka (Japan), 13-15 Feb 1989). In *Impurity control in toroidal devices: Proceedings of a technical committee meeting held in Naka-Gun, Japan, 13-15 February 1989.* Order Number DE90618585. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

Strong asymmetry in recycling and heat load between the inner leg and the outer leg of the separatrix in JT-60 tokamak is observed. When the toroidal field is reversed, the asymmetry is also reversed. An improved divertor confinement is obtained with high power neutral beams which is associated with the reduction of the radiation in the core plasma and the increase of recycling and radiation in the divertor region. (author). 2 refs, 9 figs.

23006 (IAEA-TECDOC–536, pp. 89-94) **Measurements of the charge state distribution and transport of iron impurity ions in TFTR plasmas by a multi-chord X-ray crystal spectrometer.** Bitter, M. (Princeton Univ., NJ (USA). Plasma Physics Lab.); Hsuan, H.; Hill, K.W.; Hulse, R.A.; Von Goeler, S.; Johnson, D.; Grek, B. International Atomic Energy Agency, Vienna (Austria). Jan 1990.

Contract DE-AC02-76-CHO-3073. (CONF-8902101–: IAEA technical committee meeting on impurity control, Naka (Japan), 13-15 Feb 1989). Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

The radial charge-state distribution and transport of iron impurity ions in ohmically heated TFTR plasmas has been determined by a detailed comparison of the X-ray spectra obtained from a high resolution multi-chord crystal spectrometer with the predictions from plasma modeling calculations. (author). 9 refs, 3 figs, 1 tab.

23007 (IAEA-TECDOC–536, pp. 95-100) **Impurity behaviour during ECH in the Texas experimental tokamak.** Rowan, W.L. (Texas Univ., Austin, TX (USA). Fusion Research Center); Bravenec, R.V.; Austin, M.E. International Atomic Energy Agency, Vienna (Austria). Jan 1990. Grant DE-FG05-88ER53267;Grant DE-FG05-88ER53266. (CONF-8902101–: IAEA technical committee meeting on impurity control, Naka (Japan), 13-15 Feb 1989). In *Impurity control in toroidal devices: Proceedings of a technical committee meeting held in Naka-Gun, Japan, 13-15 February 1989.* Order Number DE90618585. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

During electron cyclotron heating in the Texas Experimental Tokamak, the concentration of metallic impurities near the plasma center increased. In the experiment, a 60 GHz predominantly 0-mode wave was launched from the low-field side of the tokamak plasma. Approximately 100 kW (equivalent to 1/3 of the OH power) was deposited within a few centimeters of the plasma major radius. From analysis of the impurity behavior, it appears that the ECH induced both a substantial increase in the edge impurity source and a modest reduction in the inward impurity transport. Specifically, the edge source was increased by as much as 40%, while for $p>0.7$, the impurity diffusion was increased by 50%. The enhanced impurity diffusion occurs simultaneously with a reduction in particle confinement and with an increase in plasma potential. (author). 3 refs, 4 figs.

23008 (IAEA-TECDOC–536, pp. 101-106) **Impurity behavior in PBX L- and H-mode plasmas.** Ida, K. (Princeton Univ., NJ (USA). Plasma Physics Lab.); Fonck, R.J.; Sesnic, S.; Hulse, R.A.; Leblanc, B.; Paul, S.F. International Atomic Energy Agency, Vienna (Austria). Jan 1990. Contract DE-AC02-76-CHO3073. (CONF-8902101–: IAEA technical committee meeting on impurity control, Naka (Japan), 13-15 Feb 1989). In *Impurity control in toroidal devices: Proceedings of a technical committee meeting held in Naka-Gun, Japan, 13-15 February 1989.* Order Number DE90618585. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

Intrinsic impurity behavior and transport properties in neutral beam heated L- and H- mode PBX tokamak plasmas has been studied with a variety of impurity diagnostics. Central impurity accumulation is most often observed in H-mode discharges and sometimes results in a thermal collapse (rapid decrease of both ion and electron temperature) due to high central metallic radiation ($\approx$1.5 Wcm^{-3}). The accumulation is evident from peaked Z_{eff} and radiated power profiles and further substantiated from specific VUV and X-ray spectroscopy measurements. It is shown that impurity accumulation is neither unique to or inevitable in H-mode discharges, and it can be suppressed by sufficient gas puffing. Central accumulation is also seen in L-mode plasmas even with co-injected neutral beams. This usually occurs at high beam power and relatively low density. While there is no difference in the degree of accumulation between L- and H-mode discharges, the Z_{eff} profile itself is more peaked in the H-mode due to flatter electron density profiles in H-mode plasmas than L-mode plasmas. The degree of accumulation increases as Z_{eff} itself increases and is qualitatively explained by neoclassical convection and diffusion flux terms driven impurity-impurity collisions in addition to the usual impurity-plasma ion contributions. (author). 5 figs.

23009 (IAEA-TECDOC–536, pp. 115-121) **Impurity problems related to ICRF heating on the JIPP T-IIU tokamak.** Ogawa, Y. (Nagoya Univ. (Japan). Inst. of Plasma Physics). JIPP T-IIU Group. International Atomic Energy Agency, Vienna (Austria). Jan 1990. (CONF-8902101–: IAEA technical committee meeting on impurity control, Naka (Japan), 13-15 Feb 1989). In *Impurity control in toroidal devices: Proceedings of a technical committee meeting held in Naka-Gun, Japan, 13-15 February 1989.* Order Number DE90618585. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

In the JIPP T-IIU tokamak, a high power ICRF heating experiment has been conducted up to an extremely high power density ($\approx$ 2MW/m^3) with the total rf power of P_{rf}=2MW. Much attention has been paid to an impurity problem, and it has been found that (a) the adoption of low-Z materials as the limiter, (b) in situ carbon coating (i.e., carbonization) and (c) the adequate gas-puffing synchronized to the rf pulse are very effective to suppress the radiation loss. In combination with these methods, a remarkable reduction of the metal impurity (especially an iron) has been achieved, suppressing the total radiation loss less than 30$\approx$40% of the input power. Our five-element antenna system can provide an elaborate $k_{parallel}$-tailoring. It is found that the effect of $k_{parallel}$-tailoring on the impurity problem is unexpectedly small. (author). 5 refs, 8 figs.

23010 (IAEA-TECDOC–536, pp. 131-138) **Divertor effects and confinement properties of JT-60 lower X-point divertor discharges.** Hosogane, N. (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Tsuji, S.; Kubo, T.; Sugie, T.; Nishitani, T.; Itami, K.; Naito, O.; Nagami, M. JT-60 Team. International Atomic Energy Agency, Vienna (Austria). Jan 1990. (CONF-8902101–: IAEA technical committee meeting on impurity control, Naka (Japan), 13-15 Feb 1989). In *Impurity control in toroidal devices: Proceedings of a technical committee meeting held in Naka-Gun, Japan, 13-15 February 1989.* Order Number DE90618585. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

An improved divertor confinement (IDC) regime, which is characterized by a confinement improvement and remote radiative cooling, has been obtained in NB heated lower X-point divertor discharges in JT-60. The IDC regime has a threshold in heating power (10 MW) and a threshold in electron density. The threshold electron density depends on the connection length between the main plasma and the divertor plates. The remote radiative cooling is large for discharges with high toroidal magnetic field. The improvement in energy confinement is compatible with the remote cooling as large as 50% of the input power. (author). 5 refs, 7 figs.

23011 (IAEA-TECDOC–536, pp. 139-144) **Behavior of light impurity in beam heated JT-60 plasmas with graphite walls.** Kubo, H. (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Sugie, T.; Nishino, N. JT-60 Team. International Atomic Energy Agency, Vienna (Austria). Jan 1990. (CONF-8902101–: IAEA technical committee meeting on impurity control, Naka (Japan), 13-15 Feb 1989). In *Impurity control in toroidal devices: Proceedings of a technical committee meeting held in Naka-Gun, Japan, 13-15 February 1989.* Order Number DE90618585. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

In JT-60 discharges with graphite walls, it was observed that the oxygen density decreased and the carbon density increased during neutral beam heating. This phenomenon appeared in lower X-point discharges and limiter ones with neutral beam heating of high power (>12MW). There was a threshold electron density with respect to the onset of the phenomenon. In the X-point discharges, an improvement of the energy confinement (Improved Divertor Confinement) was observed with the phenomenon. (author). 7 refs, 7 figs.

23012 (IAEA-TECDOC–536, pp. 145-151) **Radiation losses and global power balance of JT-60 plasmas.** Nishitani, T. (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Itami, K.; Nagashima, K.; Tsuji, S.; Hosogane, N.; Shimada, M.; Yoshida, H.; Ando, T. JT-60 Team. International Atomic Energy Agency, Vienna (Austria). Jan 1990. (CONF-8902101–: IAEA technical committee meeting on impurity control, Naka (Japan), 13-15 Feb 1989). In *Impurity control in toroidal devices: Proceedings of a technical committee meeting held in Naka-Gun, Japan, 13-15 February 1989.* Order Number DE90618585. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

Radiation losses and global power balances of the plasmas in the NB heated limiter, outer and lower X-point configurations with TiC coated Molybdenum or graphite first wall have been investigated by bolometric measurements, thermocouples and IRTV camera. Very low radiation losses of the main plasma, 10% of the absorbed power, are realized in NB heated outer X-point discharges with TiC coated molybdenum wall. In the improved divertor confinement (IDC) regime radiation loss from the divertor region increases up to 40% of the absorbed power with the line averaged electron density. That of the main plasma is approximately 20% for any electron density. Intense remote radiative cooling is realized in IDC which reduces the heat load onto divertor plates. (author). 7 refs, 11 figs.

23013 (IAEA-TECDOC–536, pp. 159-164) **Plasma transport in ergodized magnetic fields.** Fuchs, G. (Association Euratom-Kernforschungsanlage Juelich (Germany, F.R.). Inst. fuer Plasmaphysik); Reiter, D.; Steffen, B. International Atomic Energy Agency, Vienna (Austria). Jan 1990. (CONF-8902101–: IAEA technical committee meeting on impurity control, Naka (Japan), 13-15 Feb 1989). In *Impurity control in toroidal devices: Proceedings of a technical committee meeting held in Naka-Gun, Japan, 13-15 February 1989.* Order Number DE90618585. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

A numerical model is presented, allowing to solve the diffusion equation for a plasma in an ergodized magnetic field. This model is applied to explain the island like structures observed from the H_α glow in the scrape-off region of TEXTOR. In accordance with the experiment, island like structures are found and they persist even in cases where the magnetic topology of the boundary - according to fieldline tracing calculations - becomes ergodic. (author). 11 refs, 4 figs.

23014 (IAEA-TECDOC–536, pp. 165-170) **Divertor plasma study in JFT-2M H-mode discharges.** Shoji, T. (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan)); Nakazawa, I. JFT-2M Group. International Atomic Energy Agency, Vienna (Austria). Jan 1990. (CONF-8902101–: IAEA technical committee meeting on impurity control, Naka (Japan), 13-15 Feb 1989). In *Impurity control in toroidal devices: Proceedings of a technical committee meeting held in Naka-Gun, Japan, 13-15 February 1989.* Order Number DE90618585. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

The behaviours of the peripheral electron temperature and the divertor plasma during the H-mode in JFT-2M single-null open divertor configuration are studied. The gradient of the peripheral electron temperature at the H-mode phase is 140-200eV/cm which is steeper than that (70-100eV/cm) at the L-mode phase and is in good agreement with that predicted by Itoh's L-H transition theory. The width of half maximum of heat flux to divertor plates is about 5cm. The heat flux to the electron side divertor is larger that that to the ion side divertor and so the electron temperature or the electron side is higher than that of the ion side. On the contrary, the particle flux and the electron density of the electron side are lower than those of the ion side. The divertor plasma density (temperature) increases (decreases) with main plasma density and saturates at some value and also increases (does not change) with the input power. (author). 10 refs, 7 figs.

Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

Impurity transport during the H-mode phase in JFT-2M was studied by using the spectroscopic measurement. In the quiescent H-mode (H-mode without ELM's) phase, both metal (titanium and iron) and light (carbon) impurity ions were accumulated in the plasma due to the enhanced particle confinement. From the comparison between the deuterium discharges and the hydrogen discharges, the impurity ions' accumulation was less pronounced in the hydrogen discharges due to the difference of the enhancement of the particle confinement in both discharges. In the H-mode with ELM's, impurity ions' accumulation was less pronounced compared with those in the quiescent H-mode phase. This is due to the exhaustion of the impurity ions by the ELM's. In the improved L-mode phase, impurity ion density profile became centrally-peaked which was concerned with the sawtooth oscillation. (author). 3 refs, 8 figs.

Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

Impurity concentrations and Z_{eff} values have been investigated in the plasmas with TiC-coated molybdenum walls and with graphite ones. Z_{eff} values and light impurity, oxygen and carbon, concentrations of the plasmas with TiC-coated molybdenum walls were lower than those with graphite ones. In the outer X-point NB heated plasmas, the Z_{eff} value was 1.6 on the TiC-coated molybdenum walls and 2.2 on the graphite ones at the line averaged electron density n-bar$_e$ of $4 \times 10^{19} m^{-3}$. And, titanium concentrations were so low that it had almost no influence on the Z_{eff} values. (author). 5 refs, 9 figs, 1 tab.

23018 (INIS-mf–11549) **Experiments on screw-pinch plasmas with elongated cross section.** Lassing, H.W. Rijksuniversiteit Utrecht (Netherlands). 16 Jun 1989. 153p. Order Number DE90706041. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

In this thesis experiments are described carried out with SPICA II, a toroidal screw-pinch plasma device, this device is the last one in a series of plasma machines of the toroidal screw-pinch differing from its predecessor in its race-track shaped section. In devices of the type toroidal screw-pinch stable confinement is possible of plasmas with larger β values than in a tokamak discharge. In a pinch the plasma is screwed up, during the formation, in such a way that in a relatively small volume a plasma is formated with a high pressure. During the screwing up the plasma is heated by shock heating as well as adiabatic compression. With the modified snowplow model the density and temperature after the formation can be calculated, starting from the initial conditions. When all ions arrive into the plasma column, the density in the column is determined by the volume compression. First purpose of the experiments was to find a stable discharge. Subsequently discharges have been made with a high as possible β in order to investigate at which maximum β it is possible to confine screw-pinch plasmas stably. When these had been found, the nature and importance could be investigated of the processes following which the screw-pinch plasma looses its energy. 75 refs., 95 figs., 8 tabs.

23019 (INIS-SU–157/A) **Gas dynamic theory of flight of fast electron flux in plasma.** Mel'nik, V.N. AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Radioastronomicheskij Inst. 1988. 25p. (In Russian). Order Number DE90618767. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Preprint no.20.

The one-dimensional flight of a fast electron flux in plasma is investigated taking into account generation and absorption of plasma waves. The transition from the kinetic description to the gas dynamics is made. The closed set of gas dynamic equations for electrons and plasmons is derived and an automodel solution is

obtained in the case of instantaneous injection. This solution represents the beam-plasma formation which travels with constant velocity. The problem on natural oscillations in the system electrons+plasmons is considered. 8 refs.; 6 figs.

23020 (IPP–1/251) **Plasma angular momentum loss by MHD mode locking.** Zohm, H.; Kallenbach, A.; Bruhns, H.; Fussmann, G.; Klueber, O. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Dec 1989. 13p. Order Number DE90759507. Available from NTIS (US Sales Only), PC A03/MF A01.

The loss of angular momentum of a rotating plasma due to mode locking is investigated using spectroscopic rotation measurements and magnetic probe data. The electromagnetic force on the plasma regarding both the interaction with the resistive vessel wall and the error field is calculated. Simulations of the temporal evolution of the toroidal bulk rotation by solving the momentum transport equation in the presence of the magnetic forces explain the toroidal momentum balance in detail. As a result we find that the plasma within the island is affected by the electromagnetic force, while the rest of the plasma is slowed down by viscous coupling. (orig.).

23021 (IPP–2/299) **On the generating function of Poincare plots defining one dimensional perturbed Hamiltonian systems.** Montvai, A. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Jan 1989. 35p. Order Number DE90759699. Available from NTIS (US Sales Only), PC A03/MF A01.

A simple numerical method has been devised, for deriving the generating function of an arbitrary, one dimensional Hamiltonian system represented by its Poincare plot. In this case, the plot to be numerically processed is an area preserving transformation of a two-dimensional surface onto itself. Although the method in its present form is capable of treating only this case, there are no principal restrictions excluding the analysis of systems with higher dimensionality as well. As an example, the generating function of the motion of alpha particles in a nonsymmetric, toroidal magnetic field is derived and studied numerically. (orig.).

23022 (IPP–2/302) **Proceedings of the 3rd workshop on Wendelstein VII-X.** Rau, F. (ed.). Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. 212p. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

This report presents the major part of the information given at the 3rd Workshop on Wendelstein VII-X, held at Schloss Ringberg near Lake Tegernsee, 26-30 June 1989. A number of 9 papers by members of the INTERATOM study group has been summarized. The ongoing work of the development of W VII-X is concentrated on a small number of Helias configurations with five field periods, in order to define their coil systems and the attainable parameter range. This effort aims at a simultaneous realization of the desired numbers of plasma aspect ratio, stability-β, transport, improvement in bootstrap current, etc., in order to arrive at a 'reference configuration' for this experiment. (orig.).

23023 (IPP–2/302, pp. 3-7) **Overview on Wendelstein VII-X.** Wobig, H. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

At IPP Garching, the experiment Wendelstein VII-X is being developed. The goals of this experiment are to continue the development of the modular advanced stellarator, to demonstrate the reactor capability of this stellarator line, and to achieve quasi-steady-state operation in a temperature regime above 5 keV. This temperature regime can be reached in Wendelstein VII-X if neoclassical transport plus the anomalous transport found in Wendelstein VII-A prevails. A heating power of 20 MW will be applied to reach the reactor-relevant parameter regime. A Helias configuration (Helical Advanced Stellarator) has been chosen because of its confinement and stability properties. (orig./AH).

23024 (IPP–2/302, pp. 8-14) **Optimization of Helias for W VII-X.** Lotz, W.; Merkel, P.; Nuehrenberg, J.; Schlueter, A.; Zille, R. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

Optimization of Helias equilibria at finite-β was attempted with respect to the following set of criteria: 1. high quality of vacuum field magnetic surfaces, 2. good finite-β equilibrium properties, 3. good MHD stability properties, 4. small neoclassical transport in the $1/\nu$-regime, 5. small bootstrap current in the lmfp-regime, 6. good collisionless α-particle containment, 7. good modular coil feasibility. (orig./AH).

23025 (IPP–2/302, pp. 15-23) **Non-local MHD-mode analysis of Helias equilibria.** Schwab, C. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

A formulation of the ideal MHD energy principle in magnetic coordinates yields the basis for a computational analysis of non-local modes in 3D-stellarator equilibria which involves two components of the displacement vector (code version CAS3D2), the third component being used for the imcompressibility conditions. Equilibrium calculations are performed with a 3D-code which exploits the assumption of nested magnetic surfaces (here, VMEC); the results can readily be used to construct the input data for the stability code in magnetic coordinates. A combination of two techniques, i.e. Fourier expansion in the angle-like coordinates and a simple finite element method in the radial direction, is used to set up the matrix which corresponds to the energy functional. A negative lowest eigenvalue, computed from a suitable matrix eigenvalue problem, indicates an unstable equilibrium. (orig./AH).

23026 (IPP–2/302, pp. 24-28) **Resistive ballooning modes in stellarators.** Wobig, H. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

The resistive ballooning mode in general stellarator geometry is analyzed following the theory of D. Correa-Restrepo published in Z.f. Naturforsch. 37a, 848 (1982). The two coupled differential equations with s along the field line as independent variable can be simplified by taking the limit $\gamma_H=c_p/c_v\to 0$. (Neglect of sound waves). The remaining equation yields the equation of ideal ballooning modes if $S_M\to\infty$, where S_M is the magnetic Reynolds number. It can be shown that an unstable solution exists at any β if S_M is finite and if a finite region of unfavourable curvature exists. For Helias configurations (low shear, low geodesic curvature) a model equation of the Mathieu type can be derived, which leads to a cubic dispersion relation for the growth rate. In the limit $S_M\to\infty$ the critical beta of ideal ballooning modes can be recovered. It can be shown that sound waves ($\gamma_H\beta\neq 0$) tend to stabilize resistive ballooning modes. (orig./AH).

23027 (IPP–2/302, pp. 29-30) **Resistive ballooning modes in a Helias configuration.** Geiger, J.; Zehrfeld, H.P. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

The Garching resistive ballooning code GARBO which was developed for stability analyzes of axisymmetric plasmas is about to include the treatment of three-dimensional equilibria as well. Preliminary results are presented for a sample configuration of HELIAS. Although this model does not represent a consistent finite-pressure stellarator equilibrium configuration, its general features as magnetic surface geometry and field line curvature properties are expected to reflect the reality of HELIAS. Real

growth rates are calculated in a beta range from one to five percent with the magnetic Reynolds number as parameters. The stabilizing effect of shear is demonstrated. (orig.).

23028 (IPP–2/302, pp. 31-39) **Monte Carlo calculations for Helias configurations.** Lotz, W. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

Transport coefficients obtained with monoenergetic particles (using pitch angle scattering and energy relaxation) have been convoluted with a Maxwellian particle distribution. Transport coefficients with Maxwellian particle distributions are shown for the configuration Helias 50 B 5 (β=4.9%). Particle transport coefficients as well as energy transport coefficients for this configuration have been computed for ions (deuterons) as well as for electrons. From these, estimates of confinement times have been derived. (orig.).

23029 (IPP–2/302, pp. 40-46) **Ripple transport in a modular Helias.** Beidler, C.D. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

Neoclassical transport rates are determined for Helical-Axis Advanced Stellarators (Helias). Special emphasis is given to Wendelstein VII-X candidates, for which the magnetic field is produced by a large number of discrete non-planar coils. The investigation is concentrated on the long-mean-free-path regime where particles trapped in local ripple wells of the magnetic field make the dominant contribution to transport. For Wendelstein VII-X, such particles fall into two classes; those localized in the helical ripple common to all stellarator-type devices and those very-localized particles which are trapped in the modular ripples existing between the individual coils. Using analytical techniques it is shown that helical-ripple transport rates are substantially reduced for all Wendelstein VII-X candidates relative to classical stellarator/torsatron configurations. This reduction is most pronounced in the $1/\nu$ regime - equivalent helical ripples of less than 1% lead to reduction factors of more than an order of magnitude - but is significant throughout the entire long-mean-free-path regime. Modular ripple transport in Wendelstein VII-X is calculated by analytically solving the appropriate bounce-averaged kinetic equation. This solution assumes a general magnetic field model and fully accounts for the deformation of modular ripples due to the presence of the other magnetic-field harmonics. Results indicate that 12 coils per field period are necessary if modular-ripple losses are to remain smaller than helical-ripple losses over the entire plasma cross section. (orig.).

23030 (IPP–2/302, pp. 47-56) **Neoclassical transport (DKES code).** Maassberg, H.; Gasparino, U. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

The linearized drift kinetic equation which is the basis of the DKES code (Drift Kinetic Equation Solver) is given, approximations in the collision term and in the Vlasov operator are discussed. The relation to Monte Carlo simulation as well as to the formalism based on invariants of motion is shown. Within the DKES formalism, the monoenergetic Onsager transport relation, the energy convolution formalism and the relation to the current drive problem are described. DKES results are compared to axisymmetric models (Monte Carlo Simulation and Hinton-Hazeltine model), the influence of the radial electric field on the transport coefficients is analyzed. For the two W VII-X configurations, HS5081 and HS50B49, the transport coefficients are calculated depending on the collisionality. Finally, the convergence properties of DKES-2 code for typical W VII-X parameters are shown. (orig.).

23031 (IPP–2/302, pp. 57-60) **Calculation of the bootstrap current by direct integration of the drift kinetic equation.** Gardner, H.J.; Boozer, A.H. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

An important criterion for distinguishing W VII-X candidates is the expected magnitude of the bootstrap current. We describe a method of calculating the bootstrap current for any (stellarator or tokamak) configuration for which the magnetic field strength and the rotational transform is known. The method is simple and accurate and gives a physical interpretation of the bootstrap current within the kinetic picture. We compare our calculations for three W VII-X configurations with the theory of Shaing and Callen. (orig.).

23032 (IPP–2/302, pp. 123-126) **Neutral gas behaviour in the plasma edge of Wendelstein VII-X.** Scardovelli, R.; Sardei, F. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

For the Wendelstein VII-X configuration HS 5-8, the transport of the neutral gas released by high recycling limiters or wall sectors located in the regions of the strongest plasma outflow has been calculated with the DEGAS code for several plasma density and temperature profiles. In all the cases which have been considered, the neutral density has been found to be highest in front of the sources, dropping radially by at least one order of magnitude to the separatrix and poloidally by two orders of magnitude to the equatorial plane. The average energy of the neutrals hitting the wall has a maximum of 100-200 eV at the location where the distance between the wall and the separatrix is a minimum. This may be critical for impurity sputtering. The flux of energetic charge-exchange neutrals to the wall is reduced by 80% if lateral barriers are placed close to the regions where the plasma outflow is concentrated. (orig.).

23033 (IPP–2/302, pp. 148-163) **Experiments in W 7AS and projections to W 7X.** Renner, H. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

Beginning October 1988, after magnetic surface mapping, first plasma experiments were conducted in the advanced stellarator W 7AS. During the first phase of operation, ECF 70 GHz was used to generate and heat a 'currentless' plasma, which was maintained in quasi-steady state for typically 0.5 s. Up to now the magnetic field had to be restricted to 1.25 T. Therefore, for second harmonic heating the accessible density range is determined by the cut-off density: $n \leq 3 \cdot 10^{19}$ m^{-3}. Restricted by the density limitations for ECF-applications central values of $\beta \leq 0.5\%$ were achieved. Effects of the magnetic configuration on the confinement and measures to deal with the observed plasma current (bootstrap current) by ohmic heating and ECF-current drive were investigated. Preliminary results of transport analysis were compared with predictions of transport models. (orig.).

23034 (IPP–2/302, pp. 164-170) **Plasma parameter estimates for Wendelstein VII-X.** Wobig, H. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

For predicting plasma parameters in Wendelstein VII-X two methods are available: Scaling laws of global plasma parameters and the TEMPL-code which calculates temperature and density profiles. Global energy confinement times τ_E can be also on the assumption of neoclassical confinement and can be also based on the empirical scaling law established by the LHS-team: τ_E=0.17 anti

$n^{0.69}B^{0.84}P^{-0.58}a^{2}R^{0.75}$, where anti n is the line density, B is the magnetic field, P the heating power. The minor and major radii are a and R, respectively. The units are 10^{20} m^{-3}, T, MW, m. (orig.).

23035 (IPP–2/302, pp. 171-176) **Anomalous transport in tokamaks and stellarators.** Boozer, A. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

Anomalous transport in tokamaks is generally assumed to be caused by the drift instabilities, which have the names universal, trapped electron, and η_i modes. The fundamental properties of the drift modes, including the characteristic transport rate, can be obtained without determining whether the modes are actually unstable. These properties are independent of the details of magnetic geometry, so they should be the same in stellarators as in tokamaks. (orig.).

23036 (IPP–2/302, pp. 177-178) **ICRH for W VII-X.** Wesner, F. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

Theoretical predictions for ICRH on W VII-X; General ICRH status (tokamak experience); ICRH frequencies and operation modes for W VII-X; ICRH design criteria for W VII-X. (orig.).

23037 (IPP–2/302, pp. 179-185) **ECRH for WVII-X: Heating and current drive.** Erckmann, V. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

Application of ECRH at the W VII-X Stellarator in the microwave power range of 5 to 10 MW is discussed on the basis of results obtained at W VII-AS during the first period of operation. At W VII-AS the different rf-beams can be launched independently at arbitrary poloidal and toroidal angles with arbitrary wave polarization, which gives a high flexibility for localized heating and current drive. Shaping of the electron temperature profile from flat to peaked profiles was demonstrated by off- and on-axis power deposition, which may be important to maintain MHD-stability at finite plasma-β in W VII-X. (orig.).

23038 (IPP–4/240) **Current drive via Landau damping of kinetic Alfven wave in toroidal geometry.** Elfimov, A.G.; Puri, S. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Dec 1989. 15p. Order Number DE90759508. Available from NTIS (US Sales Only), PC A03/MF A01.

It is found that Landau-damping of low-phase-velocity ($v_p << v_{te}$, the electron thermal speed) waves is profoundly affected by toroidicity. The proportion α_u of the wave energy imparted to the untrapped particles significantly exceeds their numerical fraction. Computed values of α_u versus v_p/v_{te} are presented. The implications of these results on low-phase-velocity-wave current drive are assessed. (orig.).

23039 (IPP–5/29) **Energy transport in ASDEX in relation to theoretical and semi-empirical transport coefficients.** Gruber, O.; Wunderlich, R.; Lackner, K.; Schneider, W. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Sep 1989. 34p. Order Number DE90759504. Available from NTIS (US Sales Only), PC A03/MF A01.

A comparison of measurements with theoretically predicted energy transport coefficients has been done for Ohmic and NBI-heated discharges using both analysis and simulation codes. The contribution of strong electrostatic turbulence given by the η_i-driven modes to the ion heat conductivity is very successful in explaining the observed response of confinement to density profile changes and is found to be even in good quantitative agreement. Regarding the electron branch, a combination of trapped electron driven turbulence and resistive ballooning modes might be a promising model to explain both the correct power and density dependence of confinement time, and the observed radial dependence of the electron heat conductivity. (orig.).

23040 (IPP–5/30) **A model for periodic pellet ablation in toroidal plasma confinement experiments.** Neuhauser, J.; Wunderlich, R. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. 22p. Order Number DE90759505. Available from NTIS (US Sales Only), PC A03/MF A01.

A model is presented for the ablation of a frozen hydrogen pellet moving across field lines into a magnetically confined plasma with emphasis put on the stability of the self-controlled evaporation process. The basic mechanism investigated in detail is the non-locality of the self-shielding as a consequence of the pellet motion relative to the magnetically captured ablation material. Assuming the shielding cloud profile to be given, a one-dimensional model equation is derived which just contains the essential physics of the problem, but also allows for realistic plasma background profiles. The stability of the linearized equation is analytically investigated and the fully nonlinear equation is solved numerically for various scenarions. For small amplitude, an exponentially growing sinusoidal ablation instability is obtained, if there is significant attenuation of the heat influx along field lines and if, at the same time, the shielding cloud profile is sufficiently hollow. The typical spatial wavelength is of the order of the ionization radius. In a homogeneous plasma the instability increases until nonlinear saturation of the amplitude occurs and a quasi-stationary periodic ablation is obtained. For an inhomogeneous background plasma relevant for tokamaks like ASDEX, an ablation signature qualitatively similar to the one experimentally observed is found. We conclude therefore that the non-local shielding mechanism considered is a viable candidate for explanation of the regular striations observed along the pellet path. (orig.).

23041 (IPP–5/31) **The ASDEX integrated data analysis system AIDA.** Grassie, K.; Gruber, O.; Kardaun, O.; Kaufmann, M.; Lackner, K.; Martin, P.; Mast, K.F.; McCarthy, P.J.; Mertens, V.; Pohl, D. ASDEX Team. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. 36p. Order Number DE90759506. Available from NTIS (US Sales Only), PC A03/MF A01.

Since about two years, the ASDEX integrated data analysis system (AIDA), which combines the database (DABA) and the statistical analysis system (SAS), is successfully in operation. Besides a considerable, but meaningful, reduction of the 'raw' shot data, it offers the advantage of carefully selected and precisely defined datasets, which are easily accessible for informative tabular data overviews (DABA), and multi-shot analysis (SAS). Even rather complicated, statistical analyses can be performed efficiently within this system. In this report, we want to summarise AIDA's main features, give some details on its set-up and on the physical models which have been used for the derivation of the processed data. We also give short introduction how to use DABA and SAS. (orig.).

23042 (IPP–6/285) **Calculation of the resistive ballooning mode growth rate for a class of 3-D MHD equilibria.** Correa-Restrepo, D. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Dec 1989. 7p. Order Number DE90759509. Available from NTIS (US Sales Only), PC A02/MF A01.

A previous derivation of formulae for calculating the growth rate of resistive ballooning modes which are described by a simple model equation is extended here to a large class of general tokamak and stellarator equilibria. (orig.).

23043 (IPP–6/286) **Compressibility and resistive ballooning modes.** Correa-Restrepo, D. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Dec 1989. 7p. Order Number DE90759510. Available from NTIS (US Sales Only), PC A02/MF A01.

For equilibria stable with respect to ideal ballooning modes it is shown by means of a simple argument that, owing to plasma compressibility, resistive ballooning modes with small growth rates can only exist if they are extended along a field line. In particular, a small region of bad curvature along a field line is not sufficient for the existence of unstable modes. (orig.).

23044 (IPP–III/143) **MHD activity during ELMs.** Goeler, S. von; Klueber, O.; Fussmann, G.; Gernhardt, J.; Kornherr, M. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Jan 1989. 23p. Available from Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Available from Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.).

The MHD activity has been monitored in the ASDEX tokamak during ELMs. Besides a fast inward shift of the plasma column, a helical MHD perturbation has been found to accompany every ELM. In general the helical instability has an m number of 3 or 4, an n number of 1, and it propagates in the direction of the electron diamagnetic drift. It seems to be identical with the Toi mode, which had been observed to disappear during L to H transitions. (orig.).

23045 (IR–87-037) **Impact of electron trapping on rf current drive in tokamaks.** Giruzzi, G. Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica. 1987. 13p. Order Number DE90706048. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Radio-frequency current drive in tokamak plasmas in the presence of trapped electrons is investigated. The appropriate response function, allowing to express the current drive efficiency J/P by a simple analytical formula, is evaluated. It is shown that a significant degradation of the current generated away from the plasma axis is to be expected for methods relying on perpendicular diffusion only, even for appreciably large resonant parallel velocities.

23046 (IR–87-049) **Quasilinear and toroidal effects on current drive by electron cyclotron waves.** Giruzzi, G. Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica. 1987. 27p. Order Number DE90706049. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Current drive by electron cyclotron waves in toroidal geometry is investigated by means of a bounce-averaged Fokker-Planck code. The case of the extraordinary mode at a frequency lower than the electron gyrofrequency is studied in detail for a wave packet of finite width, carrying a power in the MW range, which is absorbed away from the plasma centre. It is shown that in this case, because of the interplay of quasilinear and trapping effects, (i) the current drive efficiency is strongly power-dependent; (ii) wave absorption at the inboard part of the magnetic surface does not maximize the efficiency, in contrast to the results of linear theory.

23047 (IR–87-058) **A high-beta tokamak equilibrium.** Kleibergen, R.; Goedbloed, J.P. Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica. 1987. 35p. Order Number DE90706050. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

A class of non-circular analytic high-beta equilibria is studied. These equilibria are characterized by three parameters, viz., elongation, triangularity, and shift of the magnetic axis. A non- orthogonal flux coordinate system is constructed analytically which possesses a favourable angular spacing. General expressions for equilibrium quantities in terms of flux coordinates are derived.

23048 (JAERI-M–89-126) **Program package for control system design and analysis (DPACS/J).** Kurihara, Kenichi (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Honda, Mitsuteru; Nakamura, Yukiharu; Kimura, Toyoaki. Japan Atomic Energy Research Inst., Tokyo (Japan). Sep 1989. 391p. (In Japanese). Order Number DE90759921. Available from NTIS (US Sales Only), PC A17/MF A01.

In order to build an optimal control system, various methods should be applied to control system design and analysis, and many 'cut and try' procedures should be taken for persuading optimality. The useful program package (DPACS/J), which will make it easy to design, and analyze control systems, has been installed in the JAERI computer. This is the manual of DPACS/J. (author).

23049 (JAERI-M–89-157) **Numerical code 'AEOLUS-E1' for analysing free-boundary resistive MHD mode.** Kurita, Gen-ichi (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Azumi, Masafumi; Takizuka, Tomonori; Tsunematsu, Toshihide; Takeda, Tatsuoki. Japan Atomic Energy Research Inst., Tokyo (Japan). Oct 1989. 58p. (In Japanese). Order Number DE90759903. Available from NTIS (US Sales Only), PC A04/MF A01.

Numerical code 'AEOLUS-E1' for analysing a free-boundary resistive MHD mode in a tokamak is developed. Reduced set of the resistive MHD equation is solved as a single-helicity free-boundary problem based on 'pseudo-vacuum' model in a cylindrical geometry. The code can solve problems including effects of coupling to external circuit and interaction between plasma and limiter. (author).

23050 (JAERI-M–89-164) **High βp bootstrap tokamak reactor.** Kikuchi, Mitsuru (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Oct 1989. 39p. Order Number DE90759889. Available from NTIS (US Sales Only), PC A03/MF A01.

Basic characteristics of a steady state tokamak fusion reactor is presented. The minimum required energy multiplication factor Q is found to be 20 to 30 for the feasibility of the fusion reactor. Such a high Q steady state tokamak operation is possible, within our present knowledge of the operational constraints and the current drive physics, when a large fraction of the plasma current is carried by the bootstrap current. Operation at high βp ($\geq$2.0) and high qψ (=4-5) with relatively small $\epsilon\beta$p (<0.5) enables to drive bootstrap current up to 70-80% of the total plasma current without deteriorating Troyon beta limit. The rest of the plasma current can be driven by the high energy neutral beam with the energy multiplication factor Q of 30-50. The energy confinement scaling laws predict that the reactor condition is attainable by increasing the major radius (Rp) up to 9m in such a high βp and high q plasma at relatively low plasma current of 12 MA with the confinement enhancement factor of 2 compared with the L-mode scaling. This high βp reactor has a reasonable size (Vp = 1500m^3) and fusion output power (2.5 GW) and is consistent with the present knowledges of the plasma physics of the tokamak, namely the Troyon limit, the energy confinement scalings, the bootstrap current, the current drive efficiency (NB current drive with the total power of 70 MW and the beam energy of 1 MeV) with a favorable aspect on the formation of the cold and dense diverter plasma-condition. From the economical aspect of the tokamak fusion reactor, a more compact reactor is favorable. The use of the high field magnet with Bmax = 16T (for example T_i-doped Nb_3Sn conductor) enables to reduce the total machine size to 50% of the above-described conventional design, namely Rp = 7m, Vp = 760m^{-3}, P_F = 2.8 GW. (author).

23051 (JAERI-M–89-169) **Current drive and sustain experiments with the bootstrap current in JT-60.** Kikuchi, Mitsuru (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Azumi, Masafumi; Tani, Keiji; Tsuji, Shunji; Kubo, Hirotaka. Japan Atomic Energy Research Inst., Tokyo (Japan). Nov 1989. 42p. Order Number DE90759892. Available from NTIS (US Sales Only), PC A03/MF A01.

The current drive and sustain experiments with the neoclassical bootstrap current are performed in the JT-60 tokamak. It is shown that up to 80% of total plasma current is driven by the bootstrap current in extremely high β_p regime (β_p = 3.2) and the current drive product I_p (bootstrap) n-bar$_e$R$_p$ up to 4.4 x 10^{19} MAm^{-2} has been attained with the bootstrap current. The experimental resistive loop voltages are compared with the calculations using the neoclassical resistivity with and without the bootstrap current and the Spitzer resistivity for a wide range of the plasma current (I_p = 0.5 -2 MA) and the poloidal beta (β_p = 0.1 - 3.2). The calculated resistive loop voltage is consistent with the neoclassical prediction including the bootstrap current. Current sustain with the bootstrap current is tested by terminating the I_p feedback control during the high power neutral beam heating. An enhancement of the L/R decay time than those expected from the plasma resistivity with measured T_e and Zeff has been confirmed experimentally supporting the large non-inductive current in the plasma and is consistent with the neoclassical prediction. A new technique to calculate the bootstrap current in multi-collisionality regime for finite aspect ratio tokamak has bee developed. The neoclassical bootstrap current is calculated directly through the force balance equations between viscous and friction forces according to the Hirshman-Sigmar theory. The bootstrap current driven by the fast ion component is also included.

Ballooning stability of the high β_p plasma are analyzed using the current profiles including the bootstrap current. The plasma pressure is close to the ballooning limit in high β_p discharges. (author).

23052 (JET-R–89-12) **A predictive equilibrium code for JET.** Guo, W.K.; Micozzi, P. Commission of the European Communities, Abingdon (UK). JET Joint Undertaking. 1989. 24p. Order Number DE90618740. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

A new predictive fixed boundary equilibrium code has been developed. This code has two main features. Firstly it is an inverse equilibrium code: it serves to predict what the current should be in the poloidal coils when a plasma with a specific cross-sectional shape is required. Secondly, because it is based on a semi-analytic method and accepts a simple iron core model for the JET transformer, it is a very fast code - it takes less than 10 seconds IBM 3090 CPU time for one result. In comparison with the experimental data, the validity of the code has been proven. (author).

23053 (JET-R–89-13) **3/2 or 5/2 for convective thermal transport?.** Duechs, D.F. Commission of the European Communities, Abingdon (UK). JET Joint Undertaking. Jul 1989. 13p. Order Number DE90618599. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

To resolve frequent arguments on the form of the convective part of the thermal energy flux the relevant definitions and equations are compiled. The relative importance of the different terms involved is shown for Joint European Torus (JET) data. The choice of the "adiabatic source terms", p"centre dot"div v- "->" or v- "->centre dot"grad p, decides the form of the convective heat flux. (author).

23054 (JET-R–89-15) **Gas release on venting the JET torus.** Coad, J.P. Commission of the European Communities, Abingdon (UK). JET Joint Undertaking. 1989. 13p. Order Number DE90618741. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

On a number of occasions when Joint European Torus (JET) has been vented, the air in the vessel has been sampled prior to opening any flanges. Large amounts ($\approx 1.3 \times 10^{23}$ atoms) of deuterium are found to have been released from the walls, together with a proportion of the tritium previously produced for (d-d) reaction. A far larger amount of tritium (comparable to the deuterium level above) would be released in the active phase of JET. The amount released can be greatly reduced by carbonising before venting, or by venting the vessel and re-evacuating prior to the venting for personnel access. (author).

23055 (KEK–89-14) **Proceedings of the workshop on role of plasmas in accelerators.** Ogata, Atsushi (ed.). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Oct 1989. 101p. (CONF-8908213–: Workshop on role of plasmas in accelerators, Tsukuba (Japan), 21 Aug 1989). Order Number DE90759999. Available from NTIS (US Sales Only), PC A06/MF A01.

This issue is the collection of the papers presented at the title meeting. The 8 of the presented papers are indexed individually. (J.P.N.).

23056 (LA-UR–90-692) **New methods in plasma simulation.** Mason, R.J. Los Alamos National Lab., NM (USA). 23 Feb 1990. 28p. Sponsored by U.S. DOE Management & Administration. DOE Contract W-7405-ENG-36. (CONF-891182–3: International conference on plasma physics, New Delhi (India), 22-28 Nov 1989). Order Number DE90007507. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The development of implicit methods of particle-in-cell (PIC) computer simulation in recent years, and their merger with older hybrid methods have created a new arsenal of simulation techniques for the treatment of complex practical problems in plasma physics. The new implicit hybrid codes are aimed at transitional problems that lie somewhere between the long time scale, high density regime associated with MHD modeling, and the short time scale, low density regime appropriate to PIC particle-in-cell techniques. This transitional regime arises in ICF coronal plasmas, in pulsed power plasma switches, in Z-pinches, and in foil implosions. Here, we outline how such a merger of implicit and hybrid methods has been carried out, specifically in the ANTHEM computer code, and demonstrate the utility of implicit hybrid simulation in applications. 25 refs., 5 figs.

23057 (LRP–386/89, pp. 3) **Quasi-optical gyrotron: present status and future prospect.** Tran, M.Q. (Centre de Recherches en Physique des Plasmas, Lausanne (Switzerland)). Centre de Recherches en Physique des Plasmas, Lausanne (Switzerland). Oct 1989. (CONF-8910353–: 14. international conference on infrared and millimeter waves, Wuerzburg (Germany, F.R.), 2 Oct 1989). In *Invited and contributed papers presented at the 14. International conference on infrared and millimeter waves.* Order Number DE90706060. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

A review of the main experiments on quasi-optical gyrotron is presented. Methods to improve the efficiency (pencil beam electron gun and depressed collector) will be discussed. (author) 5 figs., 1 tab., 10 refs.

23058 (LRP–392/90) **Review of free-electron-laser (FEL) simulation techniques.** Tran, T.M. (Centre de Recherches en Physique des Plasmas, Lausanne (Switzerland)); Wurtele, J.S. Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP). Jan 1990. 30p. Order Number DE90618601. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

In this paper we review the techniques employed in the numerical simulations of free-electron-laser, in the amplifier as well as the oscillator configuration. Special emphasis is given to the numerical problems associated with the particle initialization (particle loading), the treatment of the paraxial equation, the inclusion of oscillating space charge forces in the longitudinal particle motion and the multi-frequency modelling. This overview does not however include the particle-in-cell simulations commonly utilized in plasma physics: due to the large scale between the wiggler and the radiation wavelength, this type of technique is impractical for short wavelength free-electron-laser. (author) 2 figs., 37 refs.

23059 (LRP–394/90) **On spectral pollution.** Llobet, X. (Centre de Recherches en Physique des Plasmas, Lausanne (Switzerland)); Appert, K.; Bondeson, A.; Vaclavik, J. Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP). Jan 1990. 34p. Order Number DE90618602. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Finite difference and finite element approximations of eigenvalue problems, under certain circumstances exhibit spectral pollution, i.e. the appearance of eigenvalues that do not converge to the correct value when the mesh density is increased. In the present paper this phenomenon is investigated in a homogeneous case by means of discrete dispersion relations: the polluting modes belong to a branch of the dispersion relation that is strongly distorted by the discretization method employed, or to a new, spurious branch. The analysis is applied to finite difference methods and to finite element methods, and some indications about how to avoiding polluting schemes are given. (author) 5 figs., 10 refs.

23060 (N–90-14102) **Experimental and theoretical study of artificial plasma layers produced by two intersecting beams in a chamber.** Kuo, S.P.; Zhang, Y.S. Polytechnic Univ., Farmingdale, NY (USA). Weber Research Inst. Oct 1989. 42p. (NASA-CR–184598;NAS–1.26:184598). Available from NTIS, PC A03/MF A01.

The work done on the Bragg scattering of electromagnetic waves by microwave produced plasma layers is reported. Also summarized is the work accomplished on the propagation of high power microwave pulses in an air breakdown environment. Ongoing work on the theoretical model and numerical results of pulse propagation in air is also presented as are the results of studying the decay of plasma density and temperature.

23061 (N–90-14910) **High-frequency instability of the sheath-plasma resonance.** Stenzel, R.L. California Univ., Los Angeles, CA (USA). 1989. 43p. (NASA-CR–186127;NAS–1.26:186127). Available from NTIS, PC A03/MF A01.

Coherent high frequency oscillations near the electron plasma frequency (omega approx. less than omega sub p) are generated by electrodes with positive dc bias immersed in a uniform

Maxwellian afterglow plasma. The instability occurs at the sheath-plasma resonance and is driven by a negative RF sheath resistance associated with the electron inertia in the diode-like electron-rich sheath. With increasing dc bias, i.e., electron transit time, the instability exhibits a hard threshold, downward frequency pulling, line broadening and copious harmonics. The fundamental instability is a bounded oscillation due to wave evanescence, but the harmonics are radiated as electromagnetic waves from the electrodes acting like antennas. Wavelength and polarization measurements confirm the emission process. Electromagnetic waves are excited by electrodes of various geometries (planes, cylinders, spheres) which excludes other radiation mechanisms such as orbitrons or beam-plasma instabilities. The line broadening mechanism was identified as a frequency modulation via the electron transit time by dynamic ions. Ion oscillations at the sheath edge give rise to burst-like RF emissions. These laboratory observations of a new instability are important for antennas in space plasmas, generation of coherent beams with diodes, and plasma diagnostics.

23062 (N–90-14934) **Particle simulations in magnetospheric plasmas. Final Technical report, 1 November 1988-31 October 1989.** Nishikawa, K. Iowa Univ., Iowa City, IA (USA). Jan 1990. 7p. (NASA-CR–186238;NAS–1.26:186238). Available from NTIS, PC A02/MF A01.

In view of the recent remarkable advancement of computer technology and simulation software, simulation studies are one of the most powerful academic tools for establishment of quantitative space physics and modelling of our space environment. The complex nature encountered in space plasma physics has motivated considerable development in computer simulations, which have played an essential role in the development of space plasma theory. This report describes research undertaken to understand physical processes involved in plasma waves observed in the magnetospheric plasmas, and associated nonlinear phenomena such as heating, diffusion, and acceleration of particles due to excited waves. The research explains and clarifies the observational data both qualitatively and quantitatively.

23063 (ORNL/FEDC–89/3) **TSC [Tokamak Simulation Code] disruption scenarios and CIT [Compact Ignition Tokamak] vacuum vessel force evolution.** Sayer, R.O.; Peng, Y.K.M.; Strickler, D.J.; Jardin, S.C. Oak Ridge National Lab., TN (USA). Fusion Engineering Design Center. Jan 1990. 23p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90008087. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The Tokamak Simulation Code and the TWIR postprocessor code have been used to develop credible plasma disruption scenarios for the Compact Ignition Tokamak (CIT) in order to predict the evolution of forces on CIT conducting structures and to provide results required for detailed structural design analysis. The extreme values of net radial and vertical vacuum vessel (VV) forces were found to be F_R=−12.0 MN/rad and F_Z=−3.0 MN/rad, respectively, for the CIT 2.1-m, 11-MA design. Net VV force evolution was found to be altered significantly by two mechanisms not noted previously. The first, due to poloidal VV currents arising from increased plasma paramagnetism during thermal quench, reduces the magnitude of the extreme F_R by 15-50% and modifies the distribution of forces substantially. The second effect is that slower plasma current decay rates give more severe net vertical VV loads because the current decay occurs when the plasma has moved farther from midplane than is the case for faster decay rates. 7 refs., 9 figs., 1 tab.

23064 (PB–90-130089/XAB) **Resistive and eruptive instability by ponderomotive force with high-frequency plasma oscillations.** Li, X.Q.; Wu, S.T. Alabama Univ., Huntsville, AL (USA). Dept. of Mechanical Engineering. c 1989. 30p. Available from NTIS, PC A03/MF A01.

Pub. in Laboratory and Space Plasmas, 239-265(1989).

The authors investigated the subtle interaction between the magnetohydrodynamic (MHD) and high-frequency plasma waves and they derived the coupling equations for the phenomena. On the basis of the formalism, they examined the modulation instabilities by an electromagnetic soliton in a current sheet and showed that there is a resistive instability for constant-psi approximation (i.e., uniform magnetic field configuration), which eventually turns into an eruptive instability at the onset of the magnetic field reconnection.

23065 (PPPL–2655) **How temperature gradients are determined in toroidal plasmas.** Yoshikawa, Shoichi. Princeton Univ., NJ (USA). Plasma Physics Lab. Feb 1990. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03073. Order Number DE90008776. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

It is commonly assumed in modern-day toroidal plasmas that the edge ion or electron temperature is sufficiently low so that the edge temperature can be neglected with respect to the center temperature. For example, in a detached plasma, where the boundary condition is understood reasonably well, it is both theoretically and experimentally justified to say that the edge temperature can be approximately zero. Now in a toroidal plasma bounded by a divertor, it is theoretically possible to design a divertor such that each pair of electron and hydrogen ion can carry, on average, 3/2(kTe + kTi). Then, in the absence of recycling, the temperature gradients in the scrape-off layer can be made zero or at least, less than 1/a, where a is the plasma radius. Under that boundary condition, the temperature gradient inside the plasma vanishes. Realizing this in practice is difficult but not impossible. The problem is discussed in this paper. 1 ref.

23066 (PPPL–2680) **Waves in plasmas: Highlights from the past and present.** Stix, T.H. Princeton Univ., NJ (USA). Plasma Physics Lab. Mar 1990. 24p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03073. (CONF-891106–10: 31. annual meeting of the Division of Plasma Physics of the American Physical Society; Joint conference of the 6. international conference on plasma physics and on the 6. international congress on plasma waves and plasma instabilities, A Order Number DE90008004. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

To illustrate the development of some fundamental concepts in plasma waves, a number of experimental observations, going back over half a century, are reviewed. Particular attention is paid to the phenomena of dispersion, collisionfree damping, ray trajectories, amplitude transport, plasma wave echos, finite-Larmor-radius and cyclotron and cyclotron-harmonic effects, nonlocal response, and mode conversion. Also to the straight, trajectory approximation and two-level phase mixing. And to quasilinear diffusion and its relation to radiofrequency heating, current drive and induced neoclassical transport, and to stochasticity and superadiabaticity. One notes not only the constructive interplay between experiment and theory but also that major advances have come from each of the many disciplines that invoke plasma physics as a tool, including radio communication, astrophysics, controlled fusion, space physics, and basic research. 47 refs., 33 figs.

23067 (RAL–89-089) **Dusty plasmas.** Tsytovich, V.N. (USSR Academy of Sciences, Moscow (USSR). Inst. of General Physics); Morfill, G.E.; Bingham, R.; Angelis, U. de. Rutherford Appleton Lab., Chilton (UK). Sep 1989. 16p. Order Number DE90618742. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The field of "dusty plasmas" promises to be a very rewarding topic of research for the next decade or so, not only from the academic point of view where the emphasis is on developing the theory of the often complex collective and non-linear processes, but also from the point of view of applications in astrophysics, space physics, environmental and energy research. In this "comment" we should like to sketch the current development of this fast growing and potentially very important research area. We will discuss the new features of "dusty" plasmas in the most general terms and then briefly mention some successful applications and effects which have already been examined. (author).

23068 (RAL–89-090) **Electromagnetic wave scattering in turbulent plasmas.** Bingham, R. (Rutherford Appleton Lab., Chilton (UK)); Angelis, U. de; Tsytovich, V.; Evans, D.; Lashmore-Davies, C.N. Rutherford Appleton Lab., Chilton (UK). Sep 1989. 15p. Order Number DE90618732. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

We describe for the first time the theory of electromagnetic wave scattering in a turbulent plasma taking into account the nonlinear plasma responses due to the presence of turbulence. It is shown

that the presence of turbulence in the form of Langmuir waves introduces an extra expression in the dielectric function. This extra term is the non-linear susceptibility of the plasma due to the turbulent wave fields. It is shown that this extra term in the dielectric function produces a different expression for the dynamic form factor $S(k,\omega)$ which is related to the cross section for the scattering of an electromagnetic wave by electrons. (author).

23069 (Rijnhuizen-report–89-186, pp. 10-18) **A polarizing mirror for electron cyclotron resonance heating on RTP.** Smits, F.M.A. (Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica (Netherlands)). NWO-Euratom-FOM Collaboration. Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica. Sep 1989. A means of producing a wide range of elliptical polarizations of an electromagnetic wave by using a rotatable corrugated mirror at arbitrary total reflection angles and a variable polarization direction of the linearly polarized incident wave is presented. For the description of the reflection process, TM- and TE-like modes are defined. The phase shift between them determines the range of elliptical polarizations that can be achieved at given angles of incidence. The phase shift has been calculated for mirrors with rectangular grooves. A method has been developed to determine the phase shift from measurements on the reflected field. Experimental results are in good agreement with theory. The polarization method has been implemented for use on RTP, the Rijnhuizen Tokamak Project, and the mirror dimensions have been optimized for this purpose. (author). 7 refs.; 6 figs.

23070 (Rijnhuizen-report–89-186, pp. 19-31) **Electron cyclotron heating of high density jet H-mode discharges.** Westerhof, E. (Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica (Netherlands)); Polman, R.W.; Schep, T.J. NWO-Euratom-FOM Collaboration. Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica. Sep 1989. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

The potentially of Electron Cyclotron Heating (ECH) in high performance, high density JET H-mode discharges is studied. The aim is to show well localized, central heating with EC waves at densities n_e 1.0 to 1.5 10^{20} m^{-3}. The other plasma parameters are taken in the range B_T = 3.0 to 3.7 T and T_e = 5 to 10 keV. Ray-tracing calculations are used to analyze the options for ECH which include both first and second harmonic ordinary (O-mode) and extraordinary (X-mode) waves. The second harmonic X-mode appears to be the best choice, while the first harmonic O-mode is a good alternative if the central density does not exceed 1.0 10^{20} m^{-3}. Calculations of the power deposition profile for a realistic launching system show good central heating with second harmonic X-mode waves. (author). 6 refs.; 9 figs.; 1 tab.

23071 (Rijnhuizen-report–89-186, pp. 32-45) **Electron cyclotron current drive and m=2 mode stabilization in NET.** Giruzzi, G. (Associatie Euratom-FOM, Nieuwegein (Netherlands). In *FOM-Rijnhuizen contributions to IAEA technical committee meeting on ECE and ECRH, seventh joint workshop on ECE and ECRH (EC-7), Hefei, P.R. China, 8-11 May 1989.* Order Number DE90618809. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

Current drive by electron cyclotron waves (ECCD) in the Next European Torus is investigated. The profile and the efficiency of the driven current are calculated with a 3-dimensional bounce averaged Fokker-Placnk code coupled to a toroidal ray-tracing code. This study consists of two parts. In the first part the application of EC waves to drive the central part of the main plasma current for steady state operation is studied. It is shown taht the highest current drive efficiencies are obtained using the ordinary wave at up-shifted frequency ($\omega > \omega_c$). The maximum obtainable efficiency is limited by overlap with the second harmonic resonance and is given by $\eta \approx 0.3 A W^{-1}$ $10^{20} m^{-2}$. Off-axis, this efficiency is reduced by a factor of 2 due to trapped particles. In the second part, the application of ECCD for control of the current profile around the q=2 surface to prevent growth of the m=2, n=1 tearing mode is studied. In all cases studied, the injection of 10 MW of EC wave power at the appropriate frequency and injection angle is sufficient to stabilize the m=2, n=1 tearing mode. (author). 11 refs.; 5 figs.; 2 tabs.

23072 (Rijnhuizen-report–89-186, pp. 46-53) **A double-heterodyne ECE radiometer for the measurement of small temperature fluctuations on RTP.** Verreck, M. (Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica (Netherlands)); Hugenholtz, C.A.J. NWO-Euratom-FOM Collaboration. Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica. Sep 1989. (CONF-8905159–: Joint IAEA technical committee meeting on ECE and ECRH and 7th joint workshop on ECE and ECRH (EC-7), Hefei (China), 8-11 May 1989). In *FOM-Rijnhuizen contributions to IAEA technical committee meeting on ECE and ECRH, seventh joint workshop on ECE and ECRH (EC-7), Hefei, P.R. China, 8-11 May 1989.* Order Number DE90618809. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

A 20-channel double-conversion superheterodyne radiometer to diagnose second harmonic X-mode ECE emission from a new tokamak experiment, the 'Rijnhuizen Tokamak Project' (RTP), is under development. The main purpose of this diagnostic will be the measurement of electron-temperature fluctuations, which are suspected to play an important role in anomalous transport and heat loss effects. The double-conversion technique is characterized by the application of two frequency conversion steps for each channel. This approach offers the opportunity to do the main part of the signal handling, like bandwidth selection and amplification, on a low frequency level (< 1 GHz) where relative low cost and 'easy to manufacture' components are available. The application of this technique will increase the flexibility of radiometer systems for ECE measurements and offers the best resolution properties now possible. (author). 3 refs.; 1 fig.; 1 tab.

23073 (UCRL–21233) **Power threshold for neutral beam current drive.** Politzer, P.A. (General Atomics, San Diego, CA (USA)); Porter, G.D. Lawrence Livermore National Lab., CA (USA). 2 Oct 1989. 14p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48;AC03-89ER51114. Order Number DE90008348. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

For fully noninductive current drive in tokamaks using neutral beams, there is a power and density threshold condition, setting a minimum value for $P^{3/2}/n^2$. If this condition is not met, stationary state cannot occur, and a tokamak discharge will collapse. This is a consequence of the coupling between current and electron temperature, or between current drive efficiency and energy confinement time. 4 figs.

23074 **Process diagnostics: Materials, combustion, fusion.** Materials Research Society symposium proceedings. Volume 117. Hays, A.K. (Sandia National Labs., Albuquerque, NM (USA)); Eckbreth, A.C.; Campbell, G.A. 322p. Materials Research Society, Pittsburgh, PA (1988). (CONF-8804121–: MRS symposia on process diagnostics: materials, combustion, and fusion, Reno, NV (USA), 5-7 Apr 1988).

The book contains papers in the areas of combustion and fusion designed to overview major diagnostic techniques (laser-induced fluorescence, spontaneous Raman spectroscopy, interferometry,

imaging, Langmuir probes, multiphoton exitation/detection techniques, etc.) as applied to combustion and fusion processes. The materials processing diagnostic papers represent the current state-of-the-art diagnostics in such areas as plasma etching, CVD, PACVD, welding, vacuum arc remelting, metal extrusion, and plasma spraying.

23075 **Theory of voltage decay in applied-B ion diodes.** Desjarlais, M.P. (Sandia National Labs., Albuquerque, NM (USA)). pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). DOE Contract AC04-76DP00789. (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The author reports how a proposed theory of applied-B ion diodes has proven successful in predicting the diode voltage and current at peak power in several experiments and numerical simulations. For times after peak power, the basic theory is in good agreement with simulations but does not predict the experimentally observed voltage decay, suggesting a mechanism involving the anode plasma. The theory predicts a divergent ion current at a critical, limiting voltage $V_* = 0.6cBo^d$. Since the diode voltage is limited by the flux in the A-K gap, penetration of magnetic flux behind the active anode surface can result in decay of the diode voltage. If the voltage decay is driven by flux penetration, the ion beam should reflect this process through the change in the ion beam focus that is dictated by angular momentum constraints. The flux loss inferred from experimental measurements of the ion beam motion is in good agreement with theoretical calculations of the flux loss required to explain the experimental voltage and current traces. A simple model of the flux penetration is found to be in good agreement with a number of experiments for very reasonable layer densities and velocities.

23076 **Observation of strong oscillations in an expanding plasma.** Hairapetian, G. (California Univ., Los Angeles, CA (USA). Dept. of Physics (USA)); Stenzel, R.L. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The authors describe strong oscillations of plasma potential and density observed in a two-electron-population plasma which is expanding into vacuum along an external magnetic field. During the expansion, ions are accelerated to very high energies. Preliminary observations indicate that the oscillations exists only in the presence of a cross-field electric field which self-consistently develops. The magnitude and direction of the electric field is a sensitive function of background neutral pressure and the magnetic field. A two-probe correlation measurement was performed to determine the wavenumber of the dominant mode in the observed oscillations. Initial results are reported.

23077 **High power microwave generation and particle accelerators.** Nation, J.A. (Cornell Univ., Ithaca, NY (USA). Lab. of Plasma Studies (USA)). pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The peak energy achieved in particle accelerators has increased by a factor of about 25 every decade since the 1930's. During the same interval the cost per MeV has decreased by a factor of about 16 per decade. Much of the increase in the particle energy available per dollar can be attributed to advances in microwave generation. In this review an account is presented describing some of the recent advances in ultra high power microwave generation and in the drivers for the microwave sources. The relevance of pulse power to microwave generation is emphasized and the constraints placed on the source by the accelerator requirements indicated. A discussion of other pulse power driven accelerator technologies is presented.

23078 **Experimental investigation of a localized electron temperature elevation near electron cyclotron resonance.** Lam, S.W. (Wisconsin Univ., Madison, WI (USA)); Mett, R.R.; Bettenhausen, M.; Scharer, J.E. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The authors examine detailed properties of a plasma/wave interaction in an inhomogeneous magnetic field. An electron cyclotron resonant cavity produces a plasma column which is tuned so that an electron cyclotron wave launched from a helical antenna couples to the plasma. It then interacts with the Langmuir probe to produce a localized electron temperature elevation. They have studied its dependence on launched wave frequency, plasma density, neutral pressure, and plasma source tuning. Langmuir probes with different impedances are used to illustrate the dependence of the temperature elevation phenomena on probe impedance. It is found that the temperature elevation process is maximum when the probe is near but substantially shifted from the cold electron cyclotron resonance position in a inhomogeneous plasma. Collisionless wave absorption near resonance, magnetic field and the plasma source tuning play important roles in determining the temperature elevation phenomenon. Two probe correlation measurements are carried out to determine the radial and axial extent of the elevation. These measurements are used to construct a model for the temperature elevation mechanism.

23079 **Measurement of sheath potential in an RF inductive discharge plasma with a DC magnetic field.** Kim, G.H. (Wisconsin Univ., Madison, WI (USA)); Cho, M.H.; Hershkowitz, N.; Doczy, M.; Davis, T. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The structure of a sheath near a biased electrode depends on the orientation of magnetic field relative to the plate. In the presence of an oblique magnetic fields, it has been claimed that the sheath exhibits a double structure consisting of an electrostatic sheath the order of a Debye length and a magnetic sheath, the order of the ion-gyroradius evaluated at the ion sound speed. Measurements of sheath potential, occurring in front of negatively or positively biased plate, are performed in the presence of external DC magnetic field with nearly parallel or perpendicular orientations to the plate. Measurements were made in an electrodeless rf induction plasma in a multidipole device. This source uses a single turn loop antenna made out of an enamel coated copper strip, and operates at frequencies ranging from ~1MHz to ~20MHz depending on the tuned resonance frequency, and at the neutral gas pressure $>5x10^{-5}$ torr. It has been operated with DC magnetic fields, up to ~ gauss, and strong ECR effect has been observed. Plasmas produced at low neutral pressure ($<1x10^{-3}$ torr) have good spatial uniformity independent of magnetic field direction. The results of sheath measurements by emissive probes are presented together with the detailed characteristics of the plasma.

23080 **Electron collisions with processing plasma constituents.** Becker, K.H. (City Coll., New York, NY (USA). Dept. of Physics). pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The authors are engaged in an experimental program that studies the electron-impact dissociation of NF_3, CF_4, SF_6, BCl_3 and CCl_2F_2 which are among in the most commonly employed reactive constituents of etchant gas plasmas. It is the objective of their research to determine absolute cross sections and appearance potentials for the formation of the various radiating, metastable and neutral ground-state fragments that are produced by controlled electron impact dissociation of these molecules. Experimental techniques employed include electron and optical emission spectroscopy, mass spectroscopy as well as time-of-flight (TOF) and laser-induced fluorescence (LIF) techniques. This paper focuses on molecular emissions in the near ultraviolet region of the optical spectrum. The authors discuss the emission of the BCl A yields X

band system from BCl_3, the CCl A yields X and CCl^+ A yields X band systems from CCl_2F_2 as well as continuous UV emissions following dissociative electron impact on SF_6 and NF_3.

23081 A study of binary ion plasma expansion into laboratory generated plasma wakes. Wright, K.H. (Marshall Space Flight Center, Hunts., AL (US)); Stone, N.H.; Samir, U. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The authors report plasma expansion into the wake of a large rectangular plate immersed in a collisionless, supersonic, binary ion plasma investigated in laboratory experiments. A new plasma source has been developed to generate equi-velocity, binary ion plasma flows, which allows access to new dimensions in parameter space that have previously been unavailable for laboratory studies. Specifically, the new parameters are the ionic mass ratio and the ionic component density ratio. In a series of experiments, a krypton-neon plasma (mass ratio of 4.15) is employed where the ambient density ratio of neon to krypton is varied more than an order of magnitude. The expansion is limited to early times;i.e., a few ion plasma periods, by the combination of plasma density, plasma drift speed, and vacuum chamber size. New experimental results include the propagation of a rarefaction wave for each ionic component into the ambient plasma; the formation of a plateau-like region in the neon (the lighter mass) ion current density when the neon ions are the minor ionic species in the ambient plasma; and the acceleration of both ionic species, with neon accelerating at a higher rate than krypton. Results of this study, together with those from previous single ion plasma experiments, indicate that the plasm expansion process is the dominant filling mechanism of the near wake of a body under these experimental conditions.

23082 Experimental investigation of hemispherical ion-beam modes. Garner, C.E. (University of South Florida, Tampa, FL (USA). Dept. of Physics). pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

This paper is concerned with ion-beam modes that have been produced in a double plasma device in which the driver and target plasmas are separated by a hemispherical grid biased negatively with respect to both plasmas. Both single pulses and continuous pulse trains were excited in the target plasma by application of a voltage pulse to a hemispherical grid. Detection was accomplished with a positively-biased spherical probe capable of axial and rotational movement. Spatial evolution of the wave amplitude along the axis of the hemispherical grid was detected over a distance of more than two grid radii. An increase in wave amplitude and wave phase velocity as the wave approached the geometrical focal point of the grid is predicted by the equations for wave amplitude and phase velocity for spherical ion-beam modes that we have derived using the fluid equations. The dependence of the wave phase velocity on the ion-beam speed indicates that the waves found were hemospherical ion-beam modes.

23083 TOF electron drift measurements in xenon difluoride (XeF_2) and hydrogen sulfide (H_2S) gas mixtures. Denman, C.A. (Air Force Weapons Lab., Kirtland AFB, NM (USA)); Schlie, L.A. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The authors report sensitive high-temporal resolution time-of-flight (TOF) drift measurements yielding the drift velocity (V_d), longitudinal diffusion (D_L) and a new, higher-order, diffusion coefficient (D_3) obtained in the gases XeF_2 and H_2S. The investigation into the transport properties of these gases is of interest because of their potential as a lasing constituent when combined with the highly energetic (8.5 MJ/kg) hydrogen azide (HN_3) gas. Kinetic studies indicate that a hybrid electro-chemical laser using a mixture of XeF_2/HN_3 might produce high densities of XeF(B) (B→X, 3511A) via an electrically initiated chain chemical reaction. Using conservative estimates for transfer efficiencies, such densities correspond to laser energies approaching 400J/liter. Similarly, a high energy S_2 laser (S_2(B→X), 3837.5A) using an H_2S/HN_3 mixture is a possibility.

23084 Plasma breakdown behavior of hydrogen azide (HN_3) gas mixtures. Schlie, L.A. (Air Force Weapons Lab., Kirtland AFB, NM (USA)); Wright, M.W.; Denman, C.A. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Recent work on electron beam initiated plasma studies has shown that HN_3 is a strong electron attaching molecule. In an attempt to better understand the plasma transport properties of this particular azide gas, the electrical breakdown behavior of HN_3 was investigated. There was a marked difference in the breakdown phenomena for different pressures of buffer gases. With HN_3 pressures of a few torr mixed with an atm. of inert gas, the plasma breakdown constituency of the original species is retained. In pure hydrogen azide gas, its breakdown creates a chain chemical reaction producing very intense N_2 first and second positive band emission. In addition, such a breakdown causes the molecular constituency of the gas to change from HN_3 to only H_2 and N_2, as determined by a mass spectrograph. Upon completion of the plasma initiated chain reactions, a factor of two pressure increase is always observed due to the stoichiometry of the pertinent reactions. The transient spectral behavior elucidates the kinetic processes occurring in this gas. The effect of gas temperature on the kinetics of this system is discussed. The implication of such plasma breakdown processes on potential hybrid electro-chemical lasers is described.

23085 Electron temperature and current density measurements at the anode of free burning, high intensity arcs. Leveroni, E. (Univ. of Minnesota, MN (US)); Pfender, E. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The authors report on the plasma near the anode of free-burning high-intensity argon arcs, characterized by strong deviations from thermal and chemical equilibrium, investigated by means of electric probes. This diagnostic technique is appropriate since it provides data which can be interpreted without assumptions about the thermodynamic state of the plasma. Measurements of electron and ion current density and electron temperature on the arc centerline were obtained using a probe flush with the anode surface. The results clarify the effects of arc current, electrode gap, and operating pressure on the properties of the boundary layer. In addition, they may affect the scale-up, optimization and electrode life expectancy criteria for such arcs in terms of the correct estimation of anode heat fluxes. Two-temperature non-equilibrium is shown to prevail with electron temperatures remaining around or above 10000 K in spite of the presence of the water cooled anode. The electron current density data for atmospheric pressure arcs show a non-monotonic dependence on the overall arc current, displaying a minimum which, for the shorter electrode gaps, is very pronounced. The probe characteristics indicate that the anode indeed may also collect ions from the plasma.

23086 Compressional Alfven waves in A B field gradient. Intrator, T. (Dept. of Nuclear Engineering and Engineering Physics, Univ. of Wisconsin-Madison (US)); Meassick, S.; Hershkowitz, N. pp. 160 of Conference record of the 1988 IEEE international conference on plasma science (abstracts). IEEE Service Center, Piscataway, NJ (1988). (CONF-880651–: IEEE international conference on plasma science, Seattle, WA (USA), 6-8 Jun 1988).

Technical Paper 4C4.

In the Phaedrus-B Tandem Mirror experiment, the authors excite compressional and torsional Alfven waves that can heat the plasma. At the end of the central cell of this device, the wavelengths are the same order as the parallel mirror magnetic field gradient length. Using detailed experimental diagnostics, they can

display the wave characteristics in the uniform and non uniform regions of the plasma. Their understanding of these types of waves is hampered by the non uniformity in the background plasma and magnetic mirror field which not only couples the fast and slow modes, but also makes theory very difficult. The physics of this type of problem may be relevant to geomagnetic pulsations and perpendicular ion heating in the ionosphere. Electromagnetic and electrostatic wave fields have been measured with B dot probes and capacitive emissive probes in a full two dimensional plane. The spatial dependence of the wave amplitudes, phases and polarization indicate that the fast wave magnetic fields are localized away from the mirror region with large electrostatic fluctuations and polarization change in the mirror region. The possibilities that wave energy could either be mode converted, reflected or both are examined.

23087 RF field measurements in the vicinity of an ICRF antenna. Majeski, R. (Univ. of Wisconsin-Madison (US)); Intrator, T.; Roberts, D.; Hershkowitz, N.; Tataronis, J.; Grossmann, W. pp. 160 of Conference record of the 1988 IEEE international conference on plasma science (abstracts). IEEE Service Center, Piscataway, NJ (1988). (CONF-880651–: IEEE international conference on plasma science, Seattle, WA (USA), 6-8 Jun 1988).

Technical Paper 4C5.

Measurements of the rf fields near an ICRF antenna installed in the central cell of the Phaedrus-B tandem mirror have been made, both in vacuum and in the presence of plasma. The antenna is a Faraday shielded partial turn loop. The front surface of the Faraday shield is composed of cylindrical elements in an arrangement similar to the Faraday shield design employed on TFTR. The antenna is run at relatively low power levels, in the 3.5-10 MHz frequency range. Two other ICRF systems in the phaedrus-B central cell sustain and heat the plasma at the 400 KW level. The vacuum field measurements are compared with the predictions of the ARGUS code, which models details of the Faraday shield structure. Fields in the plasma are modelled by the ANTENA code. Particle currents collected by the Faraday shield during plasma operation are also observed.

23088 Feedback control of a polymer producing glow discharge plasma. Hershkowitz, N. (Wisconsin Univ., Madison, WI (USA)); Cho, M.H.; Pruski, J.; Dekock, J.; Anderson, P. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Glow discharges are produced in a conventional parallel plate device using either propylene and argon. The propylene discharge differs from the argon discharge in that polymers are continuously deposited at the plasma boundaries. Langmuir probe Current- Voltage (I-V) characteristics are monitored with a heated mesh probe, heated "red" to prevent polymer formation on the probe in the propylene system. A PC monitors I-V characteristics every 30 seconds and compares to the authors focus on how, in the present mode of operation, the PC adjusts the gain of the glow discharge rf amplifier and maintains a desired I-V characteristic as wall conditions, etc. change. Later versions are expected to include control of the neutral as pressure and flow rate. System operation is evaluated with and without polymer formation by operating with propylene and with argon.

23089 Optimization of the efficiency in gyrotron backward wave oscillator model via tapered axial magnetic field. Ahn, S. (Naval Research Lab., Washington, DC (USA)); Ganguly, A.K. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The nonlinear evolution of the gyrotron backward wave oscillator (gyro-BWO) is investigated numerically in the presence of a tapered axial magnetic field. The set of coupled nonlinear differential equations which govern the self-consistent evolution of the TE modes and the trajectories of an ensemble of electrons in a gyrotron are solved subject to boundary conditions for both the usual BWO (power extracted at the input end) and the reflection type BWO (power extracted in the forward direction) configurations.

23090 Neutron production in deuterium-nobel gas mixtures in a plasma focus. Deeney, C. (Physics International Co., San Leandro, CA (USA)); Choi, P.; Herold, H. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The authors report experiments on the DPF 78 plasma focus (60 kV, 28 kJ) which have shown that the neutron production occurs predominantly at the time of the hard X-ray pulse. This pulse is produced by a relativistic electron beam (REB). A Cerenkov detector and an X-ray streak camera system are used to prove that this REB is generated at the time of the plasma maximum compression, come 25 ns before the plasma becomes m=0 unstable. The neutron pulse is not observed if there is no REB. This fact and the correlation between the risetime of the plasma optical emission and the risetime of the neutron pulse, indicate that the neutrons have a beam-plasma origin at this time. The theory that the neutron emission could be produced by a thermal plasma, such as the hot spots is also investigated by studying the scaling as the high Z dopant is varied. It has been observed that as the percentage of high Z dopant is increased the neutron emission decreases even though the number and brightness of the hot spots increase. A thermal origin is not completely dismissed, however, because on some shots a second neutron pulse was observed after the m=0 instability. In this paper, multi-keV electron temperature plasma is shown to exist.

23091 Z-pinch characteristics of the Tandem Puff. Thompson, J. (Maxwell Labs., Inc., San Diego, CA (USA)); Davis, P.; Loter, N.; Rauch, J.; Ware, K. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The Tandem Puff uses a coaxial gun geometry based on the dense plasma focus but without a breach insulator to generate a fast Z-pinch. Operating in vacuum the Tandem Puff uses ionized plasma from flashboards along the coaxial section to provide the initial current path in the breach and to support the axial snowplow phase of operation. The gas imploded in the fast Z-pinch phase at the end of the inner electrode is injected by a magnetically driven fast valve. The authors report experiments characterizing the Tandem Puff using neon as the working gas have been performed using ACE, a 250 kJ, 120 kV capacitor bank. With a quarter period of about 3 μs, operation of the bank at 100 kV resulted in peak drive current approaching 1.5 MA. The Z-pinch was characterized by a number of diagnostics including filtered calorimeters and XRD's, a soft pinhole camera, a spectrometer, an Imacon 790 camera used in both streak and framing mode, and current monitors.

23092 Characterization of a novel alkali metal and transition metal plasma source. Beaudry, A. (Idaho Univ., Moscow, ID (USA). Dept. of Chemical Engineering); Morin, T.J. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Results of characterization studies of a metal vapor plasma, and potentially an ion source, are presented. The source is well suited to solids having dielectric and thermal properties which permit rapid heating of the solid by a high-frequency (2-3 GHz) signal. By proper placement in a resonant cavity, the conductively and dielectrically heated solid surface emits a vapor stream which is then ionized in the near-surface region, yielding a metal ion rich plasma. The work presented here concerns plasmas produced from two alkali metal halides, NaCl and KBr, as well as from graphite, titanium dioxide, and iron oxide. The power densities involved are characteristic of high-frequency plasmas and range from 1 to 30 W/cm^3. The factor of two or three difference between the ionization potentials of the metals and of the halides or oxygen results in an

enrichment of the metal ion content of the plasma and in the presence of the halides or oxygen as atoms rather than ions. In addition to the description of the novel source, its operation, and that of the plasmas produced in it, results of preliminary attempts at extraction and characterization of a beam are presented.

23093 Pseudospark as an electron beam source. Boggasch, E. (Maryland Univ., College Park, MD (USA). Lab. for Plasma Research); Rhee, M.J. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The pseudospark discharge phenomenon with interesting charged particle emission characteristics was introduced in 1978. This discharge utilizes the breakdown characteristics of the lower pressure side of the Paschen curve in a single or multigap parallel plate electrode geometry. To investigate the electron beam produced, the authors have constructed a modular type multigap pseudospark chamber. By using radiachromic film which gives a linear response up to an absorbed dose of 18^8 rad, the spatial profile of the beam was determined. At an axial distance of 3cm from the anode a beam diameter of 1.5 mm FWHM was found. Measurements of the beam emittance using an emittance meter consisting of slits and radiachromic film is presently underway and preliminary results are presented.

23094 Plasma diagnosis in the IGNITEX experiment. Booth, W.D. (Texas Univ., Austin, TX (USA)); Bickerton, R.; Carrera, R.; Hallock, G. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The plasma diagnostics for the proposed ignition experiment IGNITEX are presented. The IGNITEX device will be a compact (major radius = 1.5 m, minor radius = 0.5 m, elongation = 1.6) ohmically heated tokamak. The objective of the IGNITEX project is to produce an ignited D-T plasma for scientific study in a cost effective way. To produce ignited plasmas at low cost (i.e. in a compact ohmically heated tokamak) it is necessary to use very high (20 T) toroidal magnetic fields. This high field will be provided by a single-turn copper coil which completely encloses the plasma vessel. The complete covering of the vacuum vessel by the coils along with their single-turn construction limits access to the plasma for diagnostics.

23095 Relativistic magnetron research. Chen, S.C. (MIT, Cambridge, MA (US)); Bekefi, G.; Temkin, R.J. pp. 160 of Conference record of the 1988 IEEE international conference on plasma science (abstracts). IEEE Service Center, Piscataway, NJ (1988). (CONF-880651–: IEEE international conference on plasma science, Seattle, WA (USA), 6-8 Jun 1988).

Technical Paper 5B9.

The possibility of phase locking of relativistic magnetrons using low power injection signals is studied. The initial long pulse (0.2-1 μs) experiment showed the importance of voltage regulation for single-mode and stable frequency operation, the excitation of modes other than the dominating mode due to excessive voltage variation was observed with in one pulse as well as on shot-to-shot bases. It is found that voltage ripples on the order of 5% directly affect the output power stability. In addition, the experiment also indicated the possibility of using velvet as the cathode material for achieving long microwave pulses. Preliminary results of a long pulse, high repetition rate (1 μs, 4 pps) highly stable magnetron system (700 kV, 770 A) are presented.

23096 Interferometry techniques on fusion plasmas. Peebles, W.A. (California Univ., Los Angeles, CA (USA). Inst. of Plasma and Fusion Research). pp. 322 of Process diagnostics: Materials, combustion, fusion. Hays, A.K.; Eckbreth, A.C.; Campbell, G.A. Materials Research Society, Pittsburgh, PA (1988). (CONF-8804121–: MRS symposia on process diagnostics: materials, combustion, and fusion, Reno, NV (USA), 5-7 Apr 1988).

Optical interferometry techniques allow phase changes in a medium to be accurately determined. Since plasmas introduce modification proportional to electron density, interferometry has been used routinely to determine the time development of electron density profiles in magnetic confinement fusion plasmas. The present paper describes the basic principles of interferometry of plasmas and establishes criteria regarding wavelength selection, vibrational phase noise, phase averaging etc. In addition, recent advances in interferometry of fusion plasmas are described. For example, high spatial sampling has allowed the detailed study of MHD phenomena such as sawteeth and Mimov oscillations and 2-D imaging interferometry has permitted tomographic reconstruction of electron density contours. Difficulties associated with interferometry on future fusion devices, such as CIT are discussed together with possible solutions.

23097 Fast-probe plasma diagnostics. Manos, D.M. (Princeton Univ., NJ (USA). Plasma Physics Lab.); Kilpatrick, S.J. pp. 322 of Process diagnostics: Materials, combustion, fusion. Hays, A.K.; Eckbreth, A.C.; Campbell, G.A. Materials Research Society, Pittsburgh, PA (1988). (CONF-8804121–: MRS symposia on process diagnostics: materials, combustion, and fusion, Reno, NV (USA), 5-7 Apr 1988).

The authors have used a variety of electrostatic, calorimetric and sample exposure probes to diagnose the edge plasma of neutral-beam heated discharges on the tokamak fusion test reactor (TFTR). In the past, spatial profiles of electron density and temperature, and other edge parameters, were generated by repositioning probes between discharges during experiments consisting of a large number of nominally identical discharges. Recently, they have employed a probe which executes a relatively rapid stroke to generate spatial and temporal profiles during a single discharge. This has greatly enhanced our ability to perform systematic studies of the edge plasma as various operating variables are changed. In addition, this rapid radial motion permits withdrawal of the probe during portions of the discharge when the intense neutral beam heating would otherwise damage the measuring tips. Applications of such a technique to low temperature, process plasmas are discussed.

23098 Optical imaging diagnostics for fusion plasmas. Allen, S.L. (Lawrence Livermore National Lab., CA (USA)). pp. 322 of Process diagnostics: Materials, combustion, fusion. Hays, A.K.; Eckbreth, A.C.; Campbell, G.A. Materials Research Society, Pittsburgh, PA (1988). (CONF-8804121–: MRS symposia on process diagnostics: materials, combustion, and fusion, Reno, NV (USA), 5-7 Apr 1988).

Imaging diagnostics are used for spatially - and temporally - resolved quantitative measurements of plasma properties such as the ionization particle source, particle and energy loss, and impurity radiation in magnetically confined fusion plasmas. Diagnostics equipped with multi-element solid-state detectors (often with image intensifiers) are well suited to the environment of large fusion machines with high magnetic fields and x-ray and neutron fluxes. The authors have used both conventional (16 ms/frame) and high-speed video cameras to measure neutral deuterium H_α (6563 A) emissions from fusion plasmas. Continuous high-speed measurements are made with video cameras operating at 0.1-0.5 ms/frame; gated cameras provide snapshots of 10-100 μs during each 16-ms video frame. Digital data acquisition and absolute intensity calibrations of the cameras enable detailed quantitative source measurements; these are extremely important in determining the particle balance of the plasma. In a linear confinement device, radial transport can be determined from the total particle balance. In a toroidal confinement device, the details of a particle recycling can be determined. Optical imaging in other regions of the spectrum are also important, particularly for the divertor region of large tokamaks. Absolutely calibrated infrared cameras have been used to image the temperature changes in the walls and thereby determine the heat flux. Absolutely calibrated imaging ultraviolet spectrometers measure impurity concentrations; both spatial and spectral imaging instruments are employed. Representative data from each of these diagnostic systems is presented.

23099 A microwave interferometer for density measurement and stabilization in process plasmas. Pearson, D.I.C. (California Univ., Los Angeles, CA (USA). Inst. of Plasma and Fusion Research); Campbell, G.A.; Domier, C.W.; Efthimion, P.C. pp. 322 of

Process diagnostics: Materials, combustion, fusion. Hays, A.K.; Eckbreth, A.C.; Campbell, G.A. Materials Research Society, Pittsburgh, PA (1988). (CONF-8804121–: MRS symposia on process diagnostics: materials, combustion, and fusion, Reno, NV (USA), 5-7 Apr 1988).

A low-cost heterodyne microwave interferometer system capable of measuring and/or controlling the plasma density over a dynamic range covering two orders of magnitude is demonstrated. The microwave frequency is chosen to match the size and density of plasma to be monitored. Large amplitude, high frequency fluctuations can be quantitatively followed and the longer-time-scale density can be held constant over hours of operation, for example during an inline production process to maintain uniformity and stoichiometry of films. A linear relationship is shown between plasma density and discharge current in a specific plasma device. This simple relationship makes control of the plasma straightforward using the interferometer as a density monitor. Other plasma processes could equally well benefit from such density control capability. By combining the interferometer measurement with diagnostics such as probes or optical spectroscopy, the total density profile and the constituent proportions of the various species in the plasma could be determined.

23100 **Generation and application of ultrafast x-ray sources.** Murnane, M.M. (California Univ., Berkeley, CA (USA). Dept. of Physics); Kapteyn, H.C.; Falcone, R.W. *IEEE (Institute of Electrical and Electronics Engineers) Journal of Quantum Electronics (USA)*, 25(12): 2417-2422 (Dec 1989).

Pulses at soft X-ray wavelengths with a duration of less than 1.5 ps were produced by focussing high-intensity, ultrafast visible laser pulses onto a solid. Reflectivity measurements indicate that the laser pulses are absorbed by a plasma formed just inside the surface of the solid before expansion occurs. The observed emission spectrum is characteristic of a high-temperature, short-lived, high-density plasma. Applications of the ultrafast X-ray pulses, including an X-ray laser scheme, are discussed.

23101 (CEA-CONF–9451) **System study methodology. Development and potential utilization for fusion.** Djerassi, H. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (FR). Inst. de Protection et de Surete Nucleaire); Rouillard, J.; Leger, D.; Sarto, S.; Zappellini, G.; Gambi, G. CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Inst. de Protection et de Surete Nucleaire. 1988. 13p. (CONF-880417–: 1. international symposium on fusion nuclear technology (ISFNT), Tokyo (Japan), 10-19 Apr 1988). Order Number DE90756404. Available from NTIS (US Sales Only), PC A03/MF A01.

The objective of this new methodology is to combine systemics with heuristics for engineering applications. The system method considers as a whole a set of dynamically interacting elements, organized for tasks. Heuristics tries to explicit the rules to apply in scientific research. This methodology is a powerful tool to evaluate the options to be made, compared with conventional analytical methods as a higher number of parameters can be taken into account, with higher quality standard while comparing the possible options. The system method takes into account interacting data or random relationships, by means of simulation modelling. Thus, a dynamical approach can be deduced and a sensitivity analysis can be performed for a very high number of options and basic data. Experimental values collection, analysis of the problem, search of solutions, sizing of the installation from defined functions, cost evaluation (planning and operating) and ranking of the options as regard all the constraints are the main points considered for the system's application. This method can be limited to a specific objective such as a fusion reactor safety analysis. The possibility of taking into account all the options, possible accidents, quality assurance, exhaustivity of the safety analysis, identification of the residual risk and modelisation of the results are the main advantages of this approach. The sophisticated architecture of a fusion reactor includes a large number of interacting systems. The new character of the fusion domain and the wide spectrum of the possible options strongly increase the advantages of a system study as a complete safety analysis can be defined before starting with the design.

23102 (CEA-CONF–9452) **System study application to the safety analysis of the exhaust and the tritium systems of a fusion reactor.** Djerassi, H. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (FR). Inst. de Protection et de Surete Nucleaire); Rouillard, J.; Leger, D.; Sarto, S.; Zappellini, G.; Gambi, G. CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Inst. de Protection et de Surete Nucleaire. 1988. 23p. (CONF-880417–: 1. international symposium on fusion nuclear technology (ISFNT), Tokyo (Japan), 10-19 Apr 1988). Order Number DE90756452. Available from NTIS (US Sales Only), PC A03/MF A01.

An applicative example of the general methodology system study to the safety analysis of the exhaust and tritium systems, in a tokamak device, is shown. The framework of the study is split into the following tasks: initial information collection, functional analysis, failure scenarios identification and description, reliability data assessment, accident sequence quantification, consequence seriousness evaluation, risk assessment. Results concerning risk contribution from direct failures show that, in the exhaust system and in the tritium system, the risk contribution to public is rather smaller than the safety design targets. Nevertheless, if the reactor building is not taken into account, the risk contribution from the exhaust system can be significant. Risk contribution to the workers seems to be not to heavy.

23103 (CEA-CONF–9482) **Investigation of γ lithium aluminate as tritium breeding material for a fusion reactor blanket.** Charpin, J.; Botter, F.; Briec, M.; Rasneur, B.; Roth, E.; Roux, N.; Sannier, J. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Technologique et de Developpement Industriel (IRDI); CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Inst. de Recherche Technologique et de Developpement Industriel (IRDI). 1988. 13p. (CONF-880417–: 1. international symposium on fusion nuclear technology (ISFNT), Tokyo (Japan), 10-19 Apr 1988). Order Number DE90756451. Available from NTIS (US Sales Only), PC A03/MF A01.

The assessment of $\gamma LiAlO_2$, a potential ceramic breeder, is in progress at CEA, within the frame of the EEC fusion technology program. The performance of this material with respect to relevant issues is being investigated i.e fabrication, unirradiated material properties, neutron irradiation damage and tritium extraction. Using the selected fabrication route, pure and homogeneous materials are obtained covering a wide range of microstructures. Optimization of material microstructure with respect to tritium release is underway and upscaling of the fabrication capacity is being considered. Investigation of properties - physico-chemical, mechanical, thermal, compatibility with structural materials and beryllium - is underway and data, needed for design purposes, are being collected. Experiments were designed to investigate the neutron irradiation and the tritium release behaviours of the material. For aluminate pellets investigated so far in the 450^0C - 600^0C range, presented results show that neutron radiation damage is negligible and that tritium residence time may be less than one day.

23104 (CEA-CONF–9483) **Preliminary study of a blanket handling device and evaluation of the feasibility of eliminating the spread of radioactive contamination.** Leger, D. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (FR). Inst. de Recherche Technologique et de Developpement Industriel (IRDI)); Djerassi, H.; Maupou, M.; Charruyer, P.; Salpietro, E. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Technologique et de Developpement Industriel (IRDI). 1988. 12p. (CONF-880417–: 1. international symposium on fusion nuclear technology (ISFNT), Tokyo (Japan), 10-19 Apr 1988). Order Number DE90756450. Available from NTIS (US Sales Only), PC A03/MF A01.

A study concerning progress and future development of the BLANKET HANDLING DEVICE of NET-DN tokamak and the related potentialities against contamination dispersal during handling of internal segments. To prevent the dust dispersion during the mantainance operations, there are three options: a Tight-Intermediate Containment (TIC), a Containment Transfer Unit (CTU) or the dust fixation on the internal components. The design of the BHD takes account of multivarious dimensioning requirements (geometrical and dimensional constraints, including characteristics of the segments and torus), environmental and operational constraints (safety, lifetime, maintainability, cooling of Blanket segments, containment). The possible solutions concerning protection of special devices, during handling and travelling, are discussed.

23105 (CLM-R–293) **Concentrations of radiologically-important tramp elements in standard-grade stainless steels with particular relevance to activation of the first wall of NET.** Butterworth, G.J. UKAEA Culham Lab., Abingdon (UK). Jul 1989. 22p. Available from H.M. Stationery Office, London, price Pound 8.00. Available from H.M. Stationery Office, London, price Pound 8.00.

The dose equivalent rate of activated components determines the optimum time for decommissioning and the procedures adopted for the management of radioactive structural wastes from nuclear reactors. In standard-grade stainless steels the elements cobalt, nickel, niobium, molybdenum, silver and possibly some rare earth metals are the only ones likely to contribute appreciably to the γ dose rate at a cooling time around 100y. Up to about 80y after shutdown, ^{60}Co generated from iron, nickel and cobalt dominates the dose rate whilst at longer times ^{94}Nb from niobium and molybdenum and ^{108m}Ag from silver present as an impurity usually become dominant. Activation calculations have been performed for the irradiation regime anticipated for the first wall of the Next European Torus, in order to determine the concentration limits on cobalt, niobium and silver in a type 316L steel such that these potential impurity elements do not appreciably enhance the overall dose rate of the steel. A review of existing information on the impurity contents of stainless steels indicates that it should not be difficult to attain the required limits in a nuclear-grade 316L steel. (author).

23106 (CONF-891007–118) **Results from recent hydrogen pellet acceleration studies with a 2-m railgun.** Kim, K.; Zhang, D.J.; King, T.; Haywood, R.; Manns, W.; Venneri, F. Illinois Univ., Urbana, IL (USA). Fusion Technology Lab. Dec 1989. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-84ER52111. From 13. IEEE symposium on fusion engineering; Knoxville, TN (USA); 2-6 Oct 1989. Order Number DE90008773. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A new 3.2-mm-diameter, two-stage, fuseless, plasma-arc-driven electromagnetic railgun has been designed, constructed, and successfully operated to achieve a record velocity of 2.67 km/s(b) for 3.2 mmD x 4 mmL solid hydrogen pellet. The first stage of this hydrogen pellet injector is a combination of a hydrogen pellet generator and a gas fun. The second stage is a 2-m-long railgun which serves as a booster accelerator. The gas fun accelerates a frozen hydrogen pellet to a medium velocity and injects it into the railgun through a perforated coupling piece, which also serves a pressure-relieving mechanism. An electrical breakdown of the propellant gas, which has followed the pellet from the gas fun into the railgun, forms a conducting plasma-arc armature immediately behind the pellet allowing for fuseless operation of the railgun. Study of the pressure profile and the behavior of the plasma-arc armature inside the railgun bore led to elimination of spurious arcing, which prevents operation of the railgun at high voltages (and, therefore, at high currents). A timing circuit that can automatically measure the pellet input velocity and allows for accurate control of arc initiation behind the pellet helps prevent pellet disintegration and mistriggering of the arc initiation circuit. Results from the recent cryogenic operation of the two-stage pellet acceleration system are reported. 11 refs., 2 figs., 1 tab.

23107 (CONF-891204–21) **ITER [International Thermonuclear Experimental Reactor] R and D breeder blanket materials.** Smith, D.L. (Argonne National Lab., IL (USA)); Daenner, W.; Kalinin, G.; Yoshida, H. Argonne National Lab., IL (USA). Dec 1989. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From 4. international conference on fusion reactor materials; Kyoto (Japan); 4-8 Dec 1989. Order Number DE90007807. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The International Thermonuclear Experimental Reactor (ITER) activity includes specific R & D in critical areas to support the ITER design. Several of the critical tasks defined as part of the ITER validating R & D are materials related. This paper presents a summary of the breeder/blanket materials related R & D conducted by the four participating parties; viz., European Community, Japan, Soviet Union and the United States. The current effort includes several subtasks in each of the following four task areas: ceramic breeder materials; lead-lithium breeder; aqueous salt solutions; and neutron multiplier materials. The objective and scope of each subtask is states. Although this work was initiated in late 1988, important results have been obtained in all four areas. The work on ceramic breeders includes properties measurements, compatibility studies, and tritium recovery experiments with Li_2O and selected ternary ceramics. Investigations on the lead-lithium breeder have focused primarily on properties, compatibility, and tritium extraction from the 17Li-83Pb eutectic alloy. The work on the aqueous salt breeders includes corrosion, solution chemistry, and radiolysis effects in a radiation environment. Investigations defined under the neutron multiplier task are focused on beryllium; however, lead in the lithium lead alloy also serves as a neutron multiplier. The schedule and planned future work in each area are summarized. 1 refs., 6 tabs.

23108 (DOE/ER–0313/7) **Fusion reactor materials semiannual progress report for the period ending September 30, 1989.** Oak Ridge National Lab., TN (USA). [1989]. 315p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90008083. Available from NTIS, PC A14/MF A01 - OSTI; GPO Dep.

This is the seventh in a series of semiannual technical progress reports on fusion reactor materials. This report combines research and development activities which were previously reported separately in the following technical progress reports: alloy development for irradiation performance, damage analysis and fundamental studies, and special purpose materials. These activities are concerned principally with the effects of the neutronic and chemical environment on the properties and performance of reactor materials; together they form one element of the overall materials program being conducted in support of the Magnetic Fusion Energy Program of the US Department of Energy. The other major element of the program is concerned with the interactions between reactor materials and the plasma and is reported separately. The Fusion Reactor Materials Program is a national effort involving several national laboratories, universities, and industries. The purpose of this series of reports is to provide a working technical record for the use of the program participants, and to provide a means of communicating the efforts of materials scientists to the rest of the fusion community, both nationally and worldwide.

23109 (DOE/ER/52111–T6) **Application of railgun principle to high-velocity hydrogen pellet injection for magnetic fusion reactor refueling: Technical progress report.** Kim, Kyekyoon. Illinois Univ., Urbana, IL (USA). Dept. of Electrical and Computer Engineering. Dec 1989. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-84ER52111. (FCPRL–8903). Order Number DE90008281. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

This report briefly discusses the research effort on using railgun accelerators to injection hydrogen fuel pellets in magnetically confined plasmas. (LSP)

23110 (DOE/ER/52158–1) **[Design of D-^{3}He commercial tokamak].** Kulcinski, G.L. Wisconsin Univ., Madison, WI (USA). Dept. of Nuclear Engineering and Engineering Physics. 1989. 31p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-89ER52158. Order Number DE90008252. Available from NTIS, PC A03/MF A01 - OSTI.

The Fusion Technology Institute of the University of Wisconsin is participating in the ARIES design study; the work during the present contract period, February 1, 1989 to October 31, 1989, is the first part of a two year project. The objective of this work has been to

contribute to the design of a D-^{3}He fueled commercial tokamak fusion reactor, ARIES II. In this proposal we summarize the work during the first phase and outline our plans for the second phase.

23111 (IAEA-TECDOC–536, pp. 75-81) **Engineering issues for plasma facing components of ITER.** Kuroda, T. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). ITER Nuclear Engineering Group). International Atomic Energy Agency, Vienna (Austria). Jan 1990. (CONF-8902101–: IAEA technical committee meeting on impurity control, Naka (Japan), 13-15 Feb 1989). In *Impurity control in toroidal devices: Proceedings of a technical committee meeting held in Naka-Gun, Japan, 13-15 February 1989.* Order Number DE90618585. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

This paper is devoted to some critical aspects of the plasma facing components of the International Thermonuclear Experimental Reactor (ITER). The specific problems of plasma facing armour material, design features, divertor plates, etc. are emphasized. The high peak power loads present a difficult engineering problem. Carbon-based materials are capable of withstanding high heat loads without melting and have less effects as an impurity into the plasma. (author). 2 refs, 6 figs, 2 tabs.

23112 (IAEA-TECDOC–536, pp. 153-158) **Performance of JT-60 first wall.** Ando, T. (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Takatsu, H.; Nakamura, H.; Yamamoto, M.; Kodama, K.; Fukaya, K.; Shimizu, M. International Atomic Energy Agency, Vienna (Austria). Jan 1990. (CONF-8902101–: IAEA technical committee meeting on impurity control, Naka (Japan), 13-15 Feb 1989). In *Impurity control in toroidal devices: Proceedings of a technical committee meeting held in Naka-Gun, Japan, 13-15 February 1989.* Order Number DE90618585. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

This paper describes material behaviors of the JT-60 divertor plates in outside and lower X-point operations performed to date with an absorbed energy up to 100 MJ/discharge. In the outside X-point operation, although heavy melting was observed at the edges of TiC-coated Mo divertor plates, bursts of Mo were suppressed by sweeping of the separatrix during neutral beam heating. About 30% of the graphite divertor tiles were broken in the outside X-point operation, while most of the graphite tiles survived in the lower X-point operation. Two different types of redeposition layers were observed on the graphite divertor tiles. Damages due to disruptions were observed on the electron-drift side of the lower divertor tiles. (author). 9 refs, 5 figs, 1 tab.

23113 (INIS-mf–11550) **Negative ion sourcery.** Os, C.F.A. van. Rijksuniversiteit Utrecht (Netherlands). 24 May 1989. 104p. Order Number DE90706042. Available from NTIS (US Sales Only), PC A06/MF A01; OSTI; INIS.

The work described in this thesis involved by current research programs in the field of nuclear-fusion. A brief introduction to fusion is given, anticipated problems related to current drive of the fusion plasma are pinpointed and probable suggestions to overcome these problem are described. One probable means for current drive is highlight: Neutral Beam Injection (NBI). This is based on injecting a 1 MeV neutral hydrogen or deuterium beam into a fusion plasma. Negative ions are needed as primary particles because they can easily be neutralized at 1 MeV. The two current schemes for production of negative ions are described, volume production and negative surface ionization. The latter method is extensively studied in this thesis. 171 refs., 55 figs., 7 tabs.

23114 (IPP–2/302, pp. 61-64) **W VII-X engineering.** Sapper, J. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

The size and the performance data of the planned experimental W VII-X device require investigations to determine whether the technical solution should be a machine with either a superconducting coil set or with a 'classical' watercooled, pulsed copper coil magnet system. While the design and the cost of a normalconducting machine can be derived from the specific cost of W VII-AS, the design, schedule, and cost of a superconducting machine have to be investigated with the help of study contracts placed with industry because the number of existing and representative superconducting fusion devices is too small for a practical and direct calculation basis. Therefore, the IPP has placed two study contracts with industry, aiming at providing realistic information about the problems of a superconducting magnet system, cryostat and refrigerator plant. In the following, first comprehensive results obtained from these studies are reported. (orig.).

23115 (IPP–2/302, pp. 65-73) **Coil studies for Helias configurations.** Merkel, P. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

The NESCOIL code for determining coils has been applied to the optimized Helias50B configuration. A solution with excellent accuracy is obtained by solving the boundary value problem with surface currents. A set of dense flux surfaces is shown. The value of iota on axis is ι=0.836 and at the edge ι=0.99. Realizations of the Helias50B vacuum field with 10 and 12 current filaments per period are presented for two slightly different coil systems (case 996 and cas 98B). (orig./AH).

23116 (IPP–2/302, pp. 74-85) **Parameter variations for W VII-X vacuum fields.** Kisslinger, J. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

For experimental flexibility, some variations of the vacuum field parameters are required, e.g. rotational transform, shear and magnetic axis position. Different possibilities are investigated and results for the configurations HS 4-12 and HS 5-8 are given. (orig.).

23117 (IPP–2/302, pp. 86-97) **Forces and stresses Helias coil systems.** Harmeyer, E. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

Numerical calculations of the distribution of magnetic forces and mechanical stresses are mainly concentrated on the 5-period configuration HS 5-8. The calculations of the magnetic forces are performed with the EFFI code. Mechanical stresses and strains are computed with the SAPV (2) and ADINA programme systems. (orig.).

23118 (IPP–2/302, pp. 98-102) **On separation in mechanical behaviour of non-planar coil systems.** Jaksic, N.; Jandl, O.; Simon-Weidner, J. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

The interest is focussed on calculations to studies of the W VII-AS and W VII-X performed by a small team of engineers. The actual investigations are belonging to the following points: (1) Examination of calculations with regard to separation effects of coil 3 (W VII-AS). (2) Investigations of separation effects on the mechanical behaviour of non-planar coil systems to get familiar with possible candidates for W VII-X. The actual state of these calculations and some of the considerations in this context will be presented here. (orig.).

23119 (IPP–2/302, pp. 103-105) **Engineering status of the W VII-AS coil system.** Sapper, J. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany,

F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

The confinement coil system of the W VII-AS experiment was finally assembled in May 1988. After a period of field mapping operation and an additional assembly phase for the completion of the experimental equipment, the machine went into plasma operation in October the same year. Following an initial experimental period with an axis induction of B_0=1.25 T (which is half of the value calculated for fundamental resonance with ECRH, 70 GHz) the machine was used for regular operation with B_0=2.5 T in January 1989. An unexpected amount of movement at modular field coils of type No. 3 and a beginning damaging effect in the winding pack compound of that coil urged the users to limit the induction to B_0 = 1.6 T for further operation. In the following, a summary of the predicted coil performance, the measured data, and the work intended for improvement of the coil system is given. (orig.).

23120 (IPP–2/302, pp. 106-110) **On normal-conducting versions for W VII-X.** Harmeyer, T. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

Normal-conducting modular coils have been built already and are successfully in use on W VII-AS. Based on feasibility studies made by industry, it is believed that extending this technique to larger experiments does not present insurmountable difficulties. For comparison with the superconducting option, a normal-conducting version has been designed which shows the limitations and restrictions of this alternative. These limitations are consequences of the large ohmic power dissipated in the coils and the available electrical energy. The temperature rise in the coils limits the flat-top time of the magnetic field. (orig.).

23121 (IPP–2/302, pp. 111-114) **Tests for superconducting W VII-X coils (short samples, small test coil, prototype coil with KfK-LCT coil).** Maurer, W. (Kernforschungszentrum Karlsruhe GmbH (Germany, F.R.). Inst. fuer Technische Physik). Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

The base of the following considerations is the stellarator configuration HS 58 A. It has 6 different coil geometries. Coil No. 5 is considered to be built as prototype for testing all principles necessary to be investigated before the final construction of W VII-X superconducting coils. The logical sequence to reach this goal is the development and testing of short lengths of the conductor, followed by the test of a subsize solenoidal coil constructed out of a full fabrication length of the conductor, then finished by the test of a prototype coil. (orig.).

23122 (IPP–2/302, pp. 115-122) **On edge fields and limiter/wall loads in HS5-8.** Rau, F.; Kisslinger, J. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

Properties of edge vacuum fields are studied for three values of the rotational transform τ for the vacuum magnetic fields of HS 5-8, a Helias configuration with major radius R_0=6.5 m and aspect ratio A $\simeq$ 10, by observing the intersection points of field lines or guiding center orbits with the first wall or with a tentative limiter system. (orig.).

23123 (IPP–2/302, pp. 127-130) **Island formation in stellarators.** Wobig, H. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

Island formation in stellarators may have several reasons: Inherent lack of symmetry in the vacuum field (helical symmetry, axisymmetry), symmetry breaking external perturbation of the vacuum field, equilibrium currents in the plasma, plasma instabilities. (orig.).

23124 (IPP–2/302, pp. 131-138) **On the reduction of magnetic islands, residues in HS 5-7.** Herrnegger, F. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

A systematic method is applied to reduce the size of magnetic islands in vacuum field configurations where the magnetic fields are given by a set of Dommaschk potentials of low order. In typical cases, fields with 3, 5, 10, 12 toroidal field periods and poloidal mode numbers up to 4 (including axisymmetric fields) define a last closed magnetic surface with aspect ratio A $\simeq$ 11 to 13 and rotational transfor τ_b=5/7 near the boundary. Cross sections of magnetic surfaces are plotted at 0, L_p/4, L_p/2 of a field period. (orig.).

23125 (IPP–2/302, pp. 139-147) **On natural magnetic islands and external perturbations in Helias vacuum fields.** Rau, F. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

Properties of magnetic islands are studied for vacuum fields of some Helias configurations which are generated by sets of modular coils. Three Helias configurations named 'Kyoto'-Helias, HS 5-7 and HS 5-8 are compared. They have 5 field periods and are adjusted for values of the rotational transform τ=1 near the edge. The configurations otherwise differ mainly in the amount of shear and the relative position of the resonant surface. (orig.).

23126 (IPP–2/302, pp. 186-188) **Neutral injection into Wendelstein VII-X.** Penningsfeld, F.P.; Speth, E. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

The present concept for Neutral Injection into W VII-X is being presented and its main characteristics are being described. The present concept is identical with the ASDEX Upgrade neutral injection concept, which delivers 6 MW per box for 55 kV hydrogen order 9 MW per box for 65 kV deuterium. Recent developments for the second injector on ASDEX Upgrade have led to a 100 kV deuterium version, which should deliver around 7 MW per box. The main advantage for W VII-X would be that for 100 kV deuterium only about 10^{21} particles sec^{-1} are delivered by neutral injection at a power of 14 MW. The injction geometry has been determined to be at an angle of 20^0 with respect to normal at the location $\Phi=0^0$ and an elevation of about 14 cm above the midplane (for co-injection). Deposition profiles have been calculated for the 3 different scenarios (55 keV H^0, 65 keV D^0, 100 keV D^0), showing that 65 keV D^0 is optimum in the sense of central heating power density and minimum shine through. A lower operational density limit, given by the maximum permissible wall load on the carbon tiles is between 6 and $8x10^{13}$ cm^{-3}. The fraction of the starting ions which are toroidally trapped depends strongly on the injection angle and assumes values of about 10% for the envisaged injection angle of 20^0. (orig./AH).

23127 (IPP–2/302, pp. 189-197) **NBI-heating of W7X using ASDEX-upgrade type NI-boxes.** Penningsfeld, F.P. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1989. (CONF-8906301–: 3. workshop on Wendelstein VII-X, Schloss Ringberg (Germany, F.R.), 26-30 Jun 1989). In *Proceedings of the 3rd workshop on Wendelstein VII-X.* Order Number DE90759669. Available from NTIS (US Sales Only), PC A10/MF A01.

Introduction: (List of first questions, W7X as NBI target); NBI-Geometry (Box and duct; beam/plasma position for $\gamma_{NI}=20^0$); Absorption of the neutral input power (H^0/55 keV/6 MW per box; D^0/65 keV/9 MW per box; D^0/100 keV/7 MW per box; Discussion of the power density profiles); Pitch angle of fast ions (global distributions; radial resolved distribution); Shinethrough losses (Transmitted power profile; lower operational limit for the target density); Conclusions. (orig.).

23128 (IPP–4/237) **Beam heating of the neutralizer gas of neutral beam injectors.** Ott, W. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Feb 1989. 37p. Available from Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Available from Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.).

It was shown by Pamela that the target thickness of the neutralizer gas in neutral beam injectors is smaller than to be expected from gas flow calculations. He explained his findings by direct and indirect beam heating of the gas and a consequent flow acceleration. The role of the neutralizer plasma electrons in the gas heating scenario is reconsidered here. To this end the particle and energy balances of the electrons are solved with allowance for ionization and dissociation of the gas by the electrons. It is shown that the direct contribution of the electrons to heating is not dominant. Their indirect contribution via ion acceleration in the space charge sheath in front of the walls is usually stronger. Methods to increase the neutralizer target thickness are investigated. They are essentially (1) structuring the neutralizer surface in order to reduce the reflection of medium energy particles and to increase the gas accommodation, (2) cooling down the neutralizer to LN_2-temperature. The scaling of the target thickness with various parameters is investigated and compared with 'cold' flow. Initially it was assumed that the neutralizer plasma electrons are hot and able to excite Balmer alpha radiation in collisions with H_2 molecules. The investigation shows that the electrons must be cold instead ($T_e<5$ eV). An enhanced emission of the unshifted Balmer alpha line as measured on the IPP test bed is probably caused by dissociative recombination of H^+_2 and H^+_3 ions leading to excited hydrogen atoms. (orig.).

23129 (IPP–4/238) **Report on the low-RF-power and data-acquisition-systems of the 2.45 GHz Lower-Hybrid Transmitter at the ASDEX tokamak.** Zouhar, M.; Monaco, F. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Mar 1989. 52p. Order Number DE90759698. Available from NTIS (US Sales Only), PC A04/MF A01.

This report relates to the low-power section of the 2.45 GHz transmitter used for current drive experiments at the ASDEX tokamak. The high-RF-power section is dealt with elsewhere. Data acquisition and evaluation of quantities pertaining to the Lower Hybrid experiment are also treated here. As in the previous report on the 1.3 GHz system (M. Zouhar: 'Beschreibung des Niederleistungsteils des HF-Systems fuer die LH-Experimente in ASDEX.', IPP-report 4/218, February 1984), most space is spent in commenting upon the amplitude (power)- and phase-feedback control loops. (orig.).

23130 (JAERI-M–89-166) **Interpretation and handling manual of fusion experimental data monitor system DAISY version 1.** Tani, Keiji (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Kihara, Kazuhisa; Haginoya, Hirofumi. Japan Atomic Energy Research Inst., Tokyo (Japan). Oct 1989. 87p. (In Japanese). Order Number DE90759890. Available from NTIS (US Sales Only), PC A05/MF A01.

We have developed a new soft program 'DAISY' to monitor fusion experimental data on graphic terminals. Users of 'DAISY' are free from the troublesome work to access data base and to lean computer graphic language, and can interactively display their abjective data with easy keyboard handling. 'DAISY' provides many display patterns, quick control of display figures and easy handling of plot data. This report summarizes a brief interpretation and the usage of 'DAISY'. (author).

23131 (JET-R–89-14) **A comparison between beryllium and graphite as materials for JET limiters and wall surfaces.** Hugon, M.; Lallia, P.P.; Rebut, P.H. Commission of the European Communities, Abingdon (UK). JET Joint Undertaking. 1989. 22p. Order Number DE90618841. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

JET has always been operated with graphite limiters. Carbonisation has been performed from time to time resulting in a temporary reduction of Z_{eff}. However, the latest results at high power (up to 30 MW) indicate that in most cases the impurity content in the plasma is too large to reach near reactor conditions. To reduce the impurity content to a level acceptable in a reactor, it is proposed to use beryllium as a material for the limiters and wall surfaces in JET. This proposal was first made four years ago on the basis of a report comparing the relative merits of beryllium and carbon. This report is now updated in the present paper, which contains three parts, covering the effects of impurities on the plasma performance, the physical and chemical properties of graphite and beryllium and a simple model for the impurity production at the plasma edge. (author).

23132 (LA-UR–89-4110) **Amplified spontaneous emission measurements on the aurora large-aperture module.** Oertel, J.A.; Czuchlewski, S.J.; Leland, W.T.; Turner, T.P. Los Alamos National Lab., NM (USA). 1989. 5p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-900530–1: Conference on lasers and electro-optics, Anaheim, CA (USA), 21-25 May 1990). Order Number DE90004841. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Amplified Spontaneous Emission is measured on the large-aperture module ($1 \times 1 \times 2$ m^3) of the Aurora KrF laser. Values are compared to the predictions of a 3-D code. 2 refs., 1 fig.

23133 (LBL–28264) **Heavy Ion Fusion Accelerator Research (HIFAR) year-end report, April 1, 1989–September 30, 1989.** Lawrence Berkeley Lab., CA (USA). Dec 1989. 25p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (HIFAN–442). Order Number DE90008068. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This report contains the following topics on heavy ion fusion: MBE-4 drifting beam quadrupole operating range; transverse emittance growth in MBE-4; an improved ion source for MBE-4; drifting beam studies on MBE-4; 2-MV injector; improvements in lifetime of the C^+ source; injector control system; Maxwell spark gap test update; ILSE cosine 2θ quadrupole magnet development; electrostatic quadrupole prototype development activity; induction accelerator cell development; effect of a spread in beamlet currents on longitudinal stability; and heavy ion linac driver analysis.

23134 (ORNL/ATD–28/V2) **An interim report on the materials and selection criteria analysis for the Compact Ignition Tokamak toroidal field coil turn-to-turn insulation system: Volume 2, Photographic summary of laboratory testing: Interim results.** Campbell, V.W.; Dooley, J.B.; Hubrig, J.G.; Janke, C.J.; McManamy, T.J.; Welch, D.E. Oak Ridge National Lab., TN (USA). Applied Technology Div. Jan 1990. 38p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90008020. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This document contains photographs showing the results of laboratory testing of the combinations of epoxy resins, hardeners, and cures undertaken as part of the Compact Ignition Tokamak Insulation Screening Program. Cryogenic shock and soak to equilibrium proved to be the most demanding condition for these materials. The degree of damage to the basic materials when a poor candidate is selected is shown to be quite dramatic. 34 figs.

23135 (ORNL/FEDC–89/4) **Equilibrium calculations for plasma control in CIT [Compact Ignition Tokamak].** Strickler, D.J. (Oak Ridge National Lab., TN (USA). Fusion Engineering Design Center); Peng, Y-K.M.; Pomphrey, N.; Jardin, S.C. Oak Ridge National Lab., TN (USA). Fusion Engineering Design Center. Jan 1990. 27p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90008086. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The free-boundary equilibrium code VEQ provides equilibrium data that are used by the Tokamak Simulation Code (TSC) in design and analysis of the poloidal field (PF) system for the Compact

Ignition Tokamak (CIT). VEQ serves as an important design tool for locating the PF coils and defining coil current trajectories and control systems for TSC. In this report, VEQ and its role in the TSC analysis of the CIT PF system are described. Equilibrium and coil current calculations are discussed, an overview of the CIT PF system is presented, a set of reference equilibria for modeling a complete discharge in CIT is described, and the concept of a plasma shape control matrix is introduced. 9 refs., 8 figs., 7 tabs.

23136 (ORNL/FEDC–90/2) **NUFACE: An interface code for the calculation of nuclear responses.** Henderson, D.L. (Oak Ridge National Lab., TN (USA)); Gomes, I.C. Oak Ridge National Lab., TN (USA). Fusion Engineering Design Center. Jan 1990. 45p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90008088. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The NUFACE interface code computes nuclear responses for use in the nuclear analysis of a given tokamak reactor design. The NUFACE code operates on the neutron and gamma fluxes provided by the one-dimensional neutral-particle transport code ONEDANT. Zonewise and zone-boundary responses are computed to obtain both zone-integrated values and maximum surface values. Information on each material mixture within a zone and on each element or isotope constituent of each material is computed. This feature allows for a detailed analysis of the reactor whereby one can easily identify the fractional contribution to the response of interest from each material and each element or isotope. 4 refs., 4 figs., 3 tabs.

23137 (ORNL/FTR–3541) **[Reactor shielding experiments and analysis]: Foreign trip report, February 10–16, 1990.** Santoro, R.T. Oak Ridge National Lab., TN (USA). 28 Feb 1990. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90008764. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The traveler participated in the ITER Specialists Meeting on Shielding Experiments and Analysis at the ITER Facilities at the Max Planck Institute for Plasma Physics, Garching, FRG and presented a paper entitled "US Shielding and Streaming Experiments: A Brief Review." The purpose of the meeting was to reach a consensus among experts in the field on shielding and related experiments required to support the design and construction of the ITER. Experiments that have been performed to date in the US, Japan, USSR, and Europe were reviewed and the results were extensively discussed for their application to the ITER design. The requirements for additional experiments along with supporting analytic needs were reviewed. The conclusions of the meeting were summarized for inclusion in ITER requirements documents.

23138 (ORNL/FTR–3542) **[Thermonuclear experimental reactor workshop on materials and components]: Foreign trip report, January 27, 1990–February 14, 1990.** Davis, J.W. Oak Ridge National Lab., TN (USA). 1 Mar 1990. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90007642. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This report summarizes the results of the Plasma Facing Components Workshop, and the Specialists' Meeting on ITER Materials Data Base which were held at the ITER Winter Session in Garching, FRG. In addition to the ITER meetings a visit was made to SEP, which produces a carbon-carbon called SEPCARB N1. This material is currently being evaluated for use in the bumper limiter of the CIT. This report describes the company, the products they produce, and their testing capability.

23139 (ORNL/TM–11420) **Particle transport in pellet fueled JET [Jet European Torus] plasmas.** Baylor, L.R. Oak Ridge National Lab., TN (USA). Jan 1990. 180p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90008077. Available from NTIS, PC A09/MF A01; OSTI; INIS; GPO Dep.

Pellet fueling experiments have been carried out on the Joint European Torus (JET) tokamak with a multi-pellet injector. The pellets are injected at speeds approaching 1400 m/s and penetrate deep into the JET plasma. Highly peaked electron density profiles are achieved when penetration of the pellets approaches or goes beyond the magnetic axis, and these peaked profiles persist for more than two seconds in ohmic discharges and over one second in ICRF heated discharges. In this dissertation, analysis of electron particle transport in multi-pellet fueled JET limiter plasmas under a variety of heating conditions is described. The analysis is carried out with a one and one-half dimensional radial particle transport code to model the experimental density evolution with various particle transport coefficients. These analyses are carried out in plasmas with ohmic heating, ICRF heating, and neural beam heating, in limiter configurations. Peaked density profile cases are generally characterized by diffusion coefficients with a central ($r/a < 0.5$) diffusivity ~ 0.1 m^2/s that increases rapidly to ~ 0.3 m^2/s at $r/a = 0.6$ and then increases out to the plasma edge as $(r/a)^2$. These discharges can be satisfactorily modeled without any anomalous convective (pinch) flux. 79 refs., 60 figs.

23140 (PNL-SA–15704) **Implications of neutron spectrum and flux defferences on fission-fusion correlations at high neutron fluence.** Garner, F.A. (Pacific Northwest Lab., Richland, WA (USA)); Heinisch, H.L.; Simons, R.L.; Mann, F.M. Pacific Northwest Lab., Richland, WA (USA). Mar 1988. 24p. Sponsored by U.S. DOE Energy Research. DOE Contract AC06-76RL01830. (CONF-880378–3: Workshop on the effects of recoil spectrum and nuclear transmutation on the evolution of the microstructure, Lugano (Switzerland), 24-29 Mar 1988). Order Number DE90008611. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The application to fusion environments of materials data derived from fission reactors involves considerations related not only to neutron spectra but also the often dominant effect of displacement rate. It is shown in this paper that fission-fusion correlation experiments directed toward helium effects and PKA recoil spectra are frequently difficult to interpret due to the strong influence of displacement rate, low energy recoils from thermal neutron absorption and in some cases a large influence of solid transmutants. It is also shown that materials data published in earlier decades must be reevaluated in light of recent advances in defining irradiation parameters. 58 refs., 23 figs., 1 tab.

23141 (PNL-SA–16984) **Neutron-induced changes in density and electrical conductivity of copper alloys at 16 to 98 dpa and 420°C.** Garner, F.A. (Pacific Northwest Lab., Richland, WA (USA)); Brager, H.R.; Anderson, K.R. Pacific Northwest Lab., Richland, WA (USA). [1989]. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract AC06-76RL01830. (CONF-891204–22: 4. international conference on fusion reactor materials, Kyoto (Japan), 4-8 Dec 1989). Order Number DE90008603. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

An irradiation experiment on copper alloys in the Fast Flux Test Facility (FFTF) at 430°C has been completed. Four exposure levels were reached with the maximum at 98 dpa. Immersion density measurements of a wide variety of copper alloys show swelling values ranging from 1 to 64% at 98 dpa. Copper that is dispersion-strengthened with 0.25% Al_2O_3 (designated Al25) appears to be the most swelling resistant and promising high conductivity alloy. The steady-state swelling rate of relatively simple copper alloys was found to be ~ 0.5%/dpa at 430°C. Both the swelling and conductivity changes of the pure copper reference alloy were found to be very reproducible. 11 refs., 4 figs., 1 tab.

23142 (PNL-SA–16989) **Tensile behavior and swelling of ternary austenitic alloys irradiated in different neutron spectra.** Hamilton, M.L. (Pacific Northwest Lab., Richland, WA (USA)); Garner, F.A.; Okada, A. Pacific Northwest Lab., Richland, WA (USA). [1989]. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract AC06-76RL01830. (CONF-891204–23: 4. international conference on fusion reactor materials, Kyoto (Japan), 4-8 Dec 1989). Order Number DE90008620. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Two nominally identical experiments were designed to study the effects of nickel, chromium, cold work and helium generation rate on neutron-induced swelling and changes in tensile properties of simple Fe-Cr-Ni alloys. One was conducted in the Oak Ridge Research Reactor (ORR) at higher He/dpa ratios and lower displacement rates than the other, conducted in the Experimental Breeder Reactor II (EBR-II). The ORR results are at higher dpa levels and show substantially more strengthening and a different temperature range of swelling. 12 refs., 4 figs., 3 tabs.

23143 (PNL-SA-16990) **Irradiation creep and swelling of the fusion heats of PCA, HT9 and 9Cr-1Mo irradiated to high neutron fluence.** Garner, F.A.; Puigh, R.J. Pacific Northwest Lab., Richland, WA (USA). [1989]. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC06-76RL01830. (CONF-891204–25: 4. international conference on fusion reactor materials, Kyoto (Japan), 4-8 Dec 1989). Order Number DE90008612. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The irradiation creep and swelling at 400–600°C of the fusion heats of PCA, HT9 and 9Cr–1Mo were studied using pressurized tubes irradiated in the Fast Flux Test Facility (FFTF). At ≤550°C the irradiation creep of all three alloys was found to be proportional to the stress level and the instantaneous swelling rate. Although swelling is sensitive to temperature, stress, alloy type, cold work and composition, the creep-swelling coupling coefficient does not appear to be very sensitive to these variables. 12 refs., 2 figs.

23144 (PNL-SA-16998) **Tritium release from irradiated beryllium at elevated temperatures.** Baldwin, D.L.; Slagle, O.D.; Gelles, D.S. Pacific Northwest Lab., Richland, WA (USA). Nov 1989. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract AC06-76RL01830. (CONF-891204–24: 4. international conference on fusion reactor materials, Kyoto (Japan), 4-8 Dec 1989). Order Number DE90008602. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Tritium release kinetics have been measured for neutron-irradiated beryllium in the temperature range of 573–884 K. Two tritium release tests of 270 and 550 hours are the first in a series of tritium release tests on irradiated Be in support of International Thermonuclear Experimental Reactor (ITER) blanket designs. Real-time tritium release curves were measured after temperature step changes of 100 K by an ionization chamber under conditions specific to ITER. The conditions and experiment were designed to measure diffusion-controlled release from irradiated Be. The preliminary conclusion from this data set is that a unique rate-controlling mechanism is not distinguishable. Apparent diffusion kinetics at lower temperatures give way to a burst release at 884 K, coincident with a restructuring and bubble coalescence in this fully dense material. 7 refs., 5 figs., 1 tab.

23145 (PPPL–2678) **The effect of prepulse on x-ray laser development using a powerful subpicosecond KrF- laser.** Nam, C.H.; Tighe, W.; Valeo, E.; Suckewer, S. Princeton Univ., NJ (USA). Plasma Physics Lab. Mar 1990. 37p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03073. Order Number DE90008003. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A high power uv laser has been developed as a pump source for short wavelength (down to 1 nm) x-ray lasers. Various schemes are considered and theoretical analysis is discussed. Spectroscopic studies of laser-target interaction have been performed and, in particular, the effect of a prepulse on plasma generation has been investigated. Analysis of the observed spectra indicates that reduction of the prepulse energy results in a higher temperature plasma. Investigation of the interaction using thin layered targets is also presented. These data provide evidence for initially hot plasma conditions generated from target layers ≤150 Å. Discussions of proposed laser schemes at 1-5 nm are presented. 45 refs., 8 figs., 1 tab.

23146 (Rijnhuizen-report–89-186) **FOM-Rijnhuizen contributions to IAEA technical committee meeting on ECE and ECRH, seventh joint workshop on ECE and ECRH (EC-7), Hefei, P.R. China, 8-11 May 1989.** NWO-Euratom-FOM Collaboration. Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica. Sep 1989. 53p. (CONF-8905159–:). Order Number DE90618809. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

This report contains five contributions all being in INIS-scope, entitled respectivel: Measurements on Waveguide Components for ECRH on RTP; Electron Cyclotron Resonance heating on RTP; Electron Cyclotron Heating of High Density JET H-Mode Discharges; Electron Cyclotron Current Drive and m=2 Mode Stabilization in NET; A Double-heterodyne ECE Radiometer for the measurement of Small Temperature Fluctuations on RTP. (author). 37 refs.; 30 figs.; 5 tabs.

23147 (SAND–90-0746C) **Designing an experimenters database using the Nijssen Information Analysis Methodology (NIAM).** Eaton, M.J. Sandia National Labs., Albuquerque, NM (USA). [1990]. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-900580–2: 1990 Digital Equipment Corporation User's Society meeting, New Orleans, LA (USA), 7-11 May 1990). Order Number DE90008548. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This paper presents a discussion of the use of the Nijssen Information Analysis Methodology (NIAM) in the design of an experimenters database. This database is used by physicists and technicians to describe the configuration and diagnostic systems used on Sandia National Laboratories Particle Beam Fusion Accelerator II (PBFA II). The design of this database presented some unique challenges because of the large degree of flexibility required to enable timely response to changing experimental configurations. The NIAM user-oriented technique proved to be invaluable in translating experimenter's requirements into an information model and then to a normalized relational design.

23148 (UCID–21952) **Optimum detector distance for neutron TOF [time-of-flight] temperature measurements.** Lerche, R.A. Lawrence Livermore National Lab., CA (USA). 8 Dec 1989. 17p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90008059. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Fuel ion temperatures for laser-driven, inertial-confinement fusion targets are often determined by neutron time-of-flight techniques. An optimum target-to-detector distance exists where the error in the temperature measurement is a minimum. Optimum distance depends on both target and detector characteristics. Equations are presented which relate the temperature error to the target ion temperature, the number of neutrons detected, and the detector temporal response. Sample calculations of temperature error and optimum detector distance for D-D and D-T plasmas are presented for typical Nova neutron time-of-flight detectors. They show that proper placement of a TOF detector is important for minimizing the temperature error for targets that have low neutron yields. For these detectors, temperature error becomes relatively insensitive to position for target yields above 10^{10} neutrons. Also, the analysis technique used to estimate signal broadening from recorded data is shown to be important for achieving statistically limited measurements. 2 refs., 11 figs., 5 tabs.

23149 (UCRL–98535) **Application of uncertainty analysis of ignition performance to the Engineering Test Reactor.** Ho, S.K.; Perkins, L.J. Lawrence Livermore National Lab., CA (USA). 16 Sep 1988. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (CONF-881031–78: 8. topical meeting on technology of fusion energy, Salt Lake City, UT (USA), 9-13 Oct 1988). Order Number DE90008310. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The design of future Engineering Test Reactor (ETR) to demonstrate ignition is complicated by the uncertainties in the projected database for ignited plasmas. Application of uncertainty analysis to ETR design utilizing a figure-of-merit defined as the probability of ignition is presented. Performance evaluation from the uncertainty analysis in density-temperature space can locate an optimum operating window for ignition. 11 refs., 5 figs., 3 tabs.

23150 (UCRL–98585) **Development of 3D simulations for heavy ion fusion beam transport and compression problems.** Mark, J. W.K. (Lawrence Livermore National Lab., CA (USA)); Friedman, A.; Chang, Chia-Lie; Drobot, A.; Mankofsky, A.; Faltens, A. Lawrence Livermore National Lab., CA (USA). Aug 1988. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8806101–12: International symposium on heavy ion inertial fusion, Darmstadt (Germany, F.R.), 28-30 Jun 1988). Order Number DE90008355. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Longitudinal beam compression and the possibility of concurrent pulse shaping have been the subject of previous studies using analytical methods and 1D and 2D codes. Here we report on a code development effort to study 3D beam transport in quadrupoles and final compression of a drifting heavy ion beam pulse. As part of

this effort we are making improvements to the ARGUS particle-in-cell (PIC) code to investigate 3D effects of magnetic quadrupole beam transport. A system with magnetic quadrupole focusing fields is realistically three dimensional. Although magnetic quadrupole are expected to be an integral part of much of the heavy ion accelerator driver, the restrictions due to space charge modifications of the beam are particularly acute during final compression and focus, and so we concentrate on this stage. Our initial preliminary benchmarking runs are presented.

23151 (UCRL–98768) **Magnetic reconnection simulation using the 2.5D em [electromagnetic] direct implicit code AVANTI.** Hewett, D.W.; Francis, G.E.; Max, C.E. Lawrence Berkeley Lab., CA (USA). 30 Aug 1988. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8809173–2: International workshop on reconnection in space plasma, Potsdam (German Democratic Republic), 5-9 Sep 1988). Order Number DE90008357. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Collisionless reconnection of magnetic field lines depends upon electron inertia effects and details of the electron and ion distribution functions, thus requiring a kinetic description of both. Though traditional explicit PIC techniques provide this description in principle, they are severely limited in parameters by time step constraints. This parameter regime has been expanded by using the recently constructed 2.5 D electromagnetic code AVANTI in this work. The code runs stably with arbitrarily large Δt and is quite robust with respect to large fluctuations occurring due to small numbers of particles per cell. We have found several qualitatively new features. The reconnection process is found to occur in distinct stages: early spontaneous reconnection fed by the free energy of an initial anisotropy in the electron component, coalescence of the resulting small-scale filaments of electron current, accompanied by electron jetting, and oscillatory flow of electrons through the magnetic X-point, superposed on continuing nonlinear growth of ion-mediated reconnection. The time evolution of stage is strongly dependent on M_i/m_e. 12 refs., 6 figs.

23152 (UCRL–98806) **Direct evidence of ponderomotive filamentation.** Young, P.E. (Lawrence Livermore National Lab., CA (USA)); Drake, R.P.; Campbell, E.M.; Estabrook, K.G.; Baldis, H.A. Lawrence Livermore National Lab., CA (USA). Sep 1988. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-881056–11: 19. European conference on laser interaction with matter (ECLIM), Madrid (Spain), 3-7 Oct 1988). Order Number DE90008367. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We present an experiment in which the ponderomotive filamentation instability is driven in a pre-formed, underdense plasma. The spatial profile of the driving beam is intentionally modulated to produce a striated intensity distribution of known periodicity. Dark-field imaging is used to observe the density perturbations produced by the instability. Ponderomotive filamentation is isolated from thermal filamentation by the plasma parameters and the intensity perturbation wavelength. The threshold intensity for perturbation wavelengths of 42 μm is approximately 3×10^{13} W/cm^2 which compares favorably with homogeneous instability theory. 6 refs., 4 figs.

23153 (UCRL–99094) **Ultra-high brightness laser research at LLNL [Lawrence Livermore National Laboratory].** Patterson, F.G.; Perry, M.D.; Campbell, E.M. Lawrence Livermore National Lab., CA (USA). Mar 1989. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-890142–6: Symposium on lasers and optics, Los Angeles, CA (USA), 15-20 Jan 1989). Order Number DE90008366. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

New short-pulse laser technology has made possible the production of extremely bright (>10^{18} W/cm^2-sr) laser sources. The use of these new techniques on large scale Nd:glass based laser systems would make it possible to produce 1000 TW (Petawatt) pulses. Such pulses would yield focused intensities exceeding 10^{21} W/cm^2 corresponding to an electric field in excess of 100 e/a_0^2 and an energy density equivalent to that of a 10 keV blackbody. The first step towards the realization of such a source is the development of a compact 10 TW laser. The design of a 10 TW table-top laser and some potential applications are described. 12 refs., 5 figs.

23154 (UCRL–102536) **Improved energy and power balance at Nova targets.** Speck, D.R.; Bibeau, C.; Ehrlich, R.B.; Henesian, M.A.; Hermes, G.L.; Laumann, C.W.; Lawson, J.K.; Powell, H.T.; Murray, J.E.; Wegner, P.J. Lawrence Livermore National Lab., CA (USA). 7 Dec 1989. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-900530–5: Conference on lasers and electro-optics, Anaheim, CA (USA), 21-25 May 1990). Order Number DE90007260. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Nova can now provide more than 40 kJ of energy and shaped laser pulses onto targets at 0.35 μm. We are improving the power balance at 0.35 μm as required for optimum target performance. 2 refs., 2 figs., 1 tab.

23155 (UCRL–102537) **Shaped pulses from Nova for inertial confinement fusion experiments.** Burkhart, S.C.; Padilla, E.H.; Weiland, T.L.; Wilcox, R.B. Lawrence Livermore National Lab., CA (USA). 7 Dec 1989. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-900530–6: Conference on lasers and electro-optics, Anaheim, CA (USA), 21-25 May 1990). Order Number DE90007261. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Temporally shaping the target irradiation pulse is crucial for the realization of inertial confinement fusion. We have developed a versatile electrooptic technique for making shaped pulses at 0.35 μm on Nova. 4 refs., 3 figs.

23156 (UCRL–102907) **WARP: A 3D (+) PIC Code for HIF simulations.** Friedman, A. (Lawrence Livermore National Lab., CA (USA)); Callahan, D.A.; Grote, D.P.; Langdon, A.B.; Haber, I. Lawrence Livermore National Lab., CA (USA). 6 Feb 1990. 20p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-900163–6: Accelerator computer code meeting, Los Alamos, NM (USA), 22-25 Jan 1990). Order Number DE90008368. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We describe WARP, a particle-in-cell code developed for heavy ion fusion accelerator studies. Along with a 3d (Cartesian) description, and r, z model, a 1d (axial) model, and an envelope calculation are being incorporated within the code. The self-field is assumed electrostatic in the beam frame; particle positions and momenta are time-advanced in the laboratory frame. We employ several non-standard techniques, including: an "isochronous" relativistic leapfrog mover, in which positions and velocities are advanced from one integer time level to the next. This facilitates particle loading and diagnostics, and a variable timestep size. Use of only two 3d field arrays (ρ and ϕ), differencing ϕ for each particle to get E; use of a single 3d array is feasible. "Residence corrections" to the applied fields from sharp-edged elements, to assure a constant impulse independent of the number of discrete steps on which a particle stops within each element. A test run which models a beam undergoing drift compression is presented. A new method for modeling bends, under development for WARP, is also described briefly. 10 refs., 8 figs., 1 tab.

23157 **Liquid metal magnetohydrodynamics.** Lielpeteris, J. 496p. Kluwer Academic Publishers, Norwell, MA (1989).

Liquid metal MHD is the subject of this book. It is of central importance in fields like metals processing, energy conversion, nuclear engineering (fast breeders or fusion reactors), geomagnetism and astrophysics. In some circumstances fluid flow phenomena are controlled by an existing magnetic field; the melts in induction furnaces or the liquid metal blanket around future tokamak fusion reactors being significant examples. In other cases the application of an external magnetic field (or of an electric current) may generate drastic modifications in the fluid motion and in the transfer rates; such effects may be used to develop new technologies (electromagnetic shaping) or to improve existing techniques (electromagnetic stirring in continuous casting). In the core of the Earth, fluid motion and magnetic fields are both present and their interaction governs important phenomena.

23158 Development of the BOLVAPS/LIBORS lithium ion source for the PBFA II accelerator. Dreike, P.L. (Sandia National Labs., Albuquerque, NM (USA)); Tisone, G.C.; Appel, D.B.; Gerstle, F.P.; Lamppa, K.P.; Mattox, D.M.; McCollister, H.L.; Moore, R.H.; Renk, T.J. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). DOE Contract AC04-76DP00789. (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

A mm thick, 10^{16} - 10^{17} cm^{-3} Li plasma may be the ion source for the PBFA II Applied-B ion diode. BOLVAPS (boil-off lithium vapor source) is a technique for making a thin layer of Li vapor by rapid ohmic heating of a thin-film laminate, one layer of which contains Li. LIBORS (laser ionization based on resonance saturation) is a technique for ionizing Li using light tuned to the 670.8 nm Li transition. The authors are fabricating and evaluating prototype BOLVAPS anodes using alumina and enameled substrates. In this paper, they describe the BOLVAPS/LIBORS scheme in detail, review its underlying physics, outline the major materials and electrical engineering challenges, and present the status of plasma source experiments.

23159 Steady-state, gas-filled orbitron maser. Rader, M. (The Univ. of Tennessee (USA)); Dyer, F.; Alexeff, I. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The authors discuss how the gas-filled orbitron maser operates reliably in the steady-state. The output consists of narrow lines that do not shift in frequency as the discharge current is varied. A typical spectrum of the microwave emission is shown. The primary reason that the device was previously operated in the pulsed mode was because the device was intended as a very-high-frequency source. Since the frequency scales as the square root of the applied voltage, and a gas-filled device cannot hold off voltages much over 1000 V, pulsed operation was used to obtain high transient voltages. However, steady-state operation is much more convenient for studying the physics of the device. The line spectrum emitted suggests that the alternate explanations of orbitron operation as two interpenetrating electron beams involved in a beam-plasma interaction is not applicable here.

23160 Transverse emittance equation with acceleration and compression. Hahn, K. (Lawrence Berkeley Lab., CA (USA)); Smith, L. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). DOE Contract AC03-76SF00098. (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Since both acceleration and bunch compression are required for a presently conceived inertial fusion driver (IFD), the understanding of their effects on the beam quality (emittance) is important. For an axially elongated beam, the 2-D transverse emittance at a given axial location is reasonable to consider, particularly with the velocity tilt; transverse emittance averaged over the entire bunch is not a useful quantity. The effect of space charge on the emittance of a drifting beam has already been studied. With the inclusion of acceleration and compression, the usual formula for emittance charge of a drifting beam is generalized. Applications to various acceleration schedules in a FODO transport channel are given. In particular, for the case of decompression in the head and tail of a bunch, the decrease of emittance is predicted.

23161 An injector for heavy ion fusion accelerator research. Rutkowski, H.L. (Lawrence Berkeley Lab., CA (USA)); Faltens, A.; Vanecek, D.; Pike, C.; Brodzik, D. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). DOE Contract AC03-76SF00098. (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

A multi beam injector is being built to provide 16-500 mA beams of C+ at 2 MeV energy. This injector will be used for physics experiments and for injection into an induction linac systems experiment. The sources are carbon cathode multiple arcs which provide plasma to a double grid plasma switch. The plasma switch is an planar electrostatic device which prevents ions from entering the extraction gap before the extraction voltage pulse is fired. The authors present data on the performance of this source in a test stand. The 1 μ sec current pulse will be injected into the acceleration column approximately 30 μ sec after the voltage pulse is applied to the column. This is to allow voltages to equilibrate and for the flat spot in the voltage pulse to be reached. The ions are accelerated in a column which consists of titanium electrodes mounted inside aluminum oxide insulator modules. Most of the sixteen beam holes are in thick plates which are machined to provide a set of alternating aperature lenses. These lenses focus the beam and inhibit propagation of backstreaming electrons. The first shelf of the column is being assembled for tests at the 1 MV level to be followed by tests with a single beam. The high voltage generator will be a 36 stage inductively graded Marx generator which resides in a pressurized vessel filled with a mixture of SF_6 and N_2.

23162 Plasma opening switch experiments on the Particle Beam Accelerator II. Sweeney, M.A. (Sandia National Labs., Albuquerque, NM (USA)); McDaniel, D.H.; Mendel, C.W.; Rochau, G.E.; Moore, W.B.S.; Mowrer, G.R.; Simpson, W.W.; Zagar, D.M.; Grasser, T.; McDougal, C.D. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). DOE Contract AC04-76DP00789. (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Plasma opening switch (POS) experiments have been done since 1986 on the PBFA-II ion beam accelerator to develop a rugged POS that will open rapidly (< 5 ns) and efficiently (>80%) into a high impedance (> 10 ohm) load. In a recent series of experiments on PBFA II, the authors have developed and tested three different switch designs that use magnetic fields to control and confine the injected plasma. All three configurations couple current efficiently to a 5-ohm electron beam diode. In this experimental series, the PBFA-II Delta Series, more extensive diagnostics were used than in previous switch experiments on PBFA II or on the Blackjack 5 accelerator at Maxwell Laboratories. Data from the experiments with these three switch designs is presented.

23163 Implicit particle simulation of vortex coalescence in an electrostatic plasma. Schutkeker, J.; Tajima, T.; Kamimura, T.; Horton, W.; Morrison, P. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Using an implicit particle-in-cell simulation code with a particle weighting scheme that initializes a driving flow field the numerical simulation of the coalescence of vortices in an electrostatic plasma has been performed and a comparison of a theoretical model with point vortices has been made. Special attention is given to the limiting case of a purely sheared flow field which gives rise to the Kelvin-Helmholtz instability, and a simpler numerical theory involving eigenvalues of the Rayleigh equation is developed for comparison. The two comparisons show good agreement in the latter case to within 50%. The experimental observations are made that linearly stable modes can be nonlinearly destabilized by the growth of linearly unstable modes and that after coalescences vortices can pass through each other and separate again, leading to an oscillatory process of coalescence.

23164 A plasma lens for linear collider final focus. Nantista, C. (California Univ., Los Angeles, CA (USA)); Cline, D.; Norem, J. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Recent experimental and theoretical effort has been directed at designing a plasma lens for the SLC final focus. Plasma lenses of

the type under consideration work on the principle that the self forces of a beam pulse can be used to pinch the beam if electrostatic neutralization by the plasma is partially or wholly realized. It is predicted that the luminosity could be increased severalfold by such a lens. The plasma would be provided by a laser-ionized gas pulse. The operating modes of the lens are constrained by conflicting requirements of minimizing backgrounds and sensitivity to beam fluctuations. Results are presented of preliminary focusing experiments using a 20 MeV linac and tests of a high-speed, pulsed valve for gas injection. Proposed experiments are also described.

23165 CASK: An electromagnetic and electrostatic particle-in-cell simulation code with conformal boundaries. . Lottati, I. (Science Applications International Corp., McLean, VA (US)); Wai, P.K.A.; Drobot, A.T. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The underlying basis of CASK is the mapping of a physical region onto a logical quadrilateral grid that represents the computational domain. The non-orthogonal mesh used in CASK is found by an elliptical solver used to generate the mapping of the logical grid to conformally fit the physical boundaries of the simulation domain. A set of high level subroutines has been written to numerically compute the gradient of mesh wide scalars, as well as the divergence and curl operators for mesh wide vector fields. The operators are correct to second order in the local mesh spacing. The algorithm selected for computing these operators contains a set of differencing coefficients to enable accurate numerical results on highly non-orthogonal curvilinear grids. The code contains both electrostatic and electromagnetic field solvers and particle orbit integration subroutines for plasma simulation. An efficient method has been developed to determine the cell location of particles on the mesh. The code has been used to find eigenmodes of cavities in the frequency domain; for transient electromagnetic problems; for intense electron beam injector design; and for simulation of a charge collecting biased probe immersed in a plasma. Representative results from these simulations are presented as well as details of the code structure and numerical algorithms employed.

23166 Absorbing boundaries for space plasma simulations. Buneman, O. (STAR LAB., Stanford Univ. (US)). pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

For the simulation of plasma phenomena in infinite space one must surround the computational domain by boundaries which absorb radiation. For spherical computational domains a rigorous absorbing condition can be formulated and implemented. This requires working in spherical polars and expanding surface data in spherical harmonics. A history of the past L steps must be kept for each L-th order harmonic in order to predict its value at the next step. For Cartesian meshes and box-shaped boundaries, Lindman's method can be applied on each of the six surfaces. It becomes very accurate if taken to high enough order. However it is arithmetic-intensive and it still leaves problems in the eight corners. Opting for the lowest order Lindman scheme and restricting angles of incidence to less than 45 degrees from vertical already achieves albedos (reflected/incident power) lower than 0.00003. Since finite differences methods for Maxwell's equations in vacuo are highly efficient, one can afford a wide buffer region between radiating plasma sources and boundaries, thereby reducing angles of incidence. In this paper, a simple PC program using the low-order method is used to demonstrate how an expanding wave is apparently fully absorbed at the boundaries.

23167 Computer simulations of finite plasmas convected across magnetized plasmas. Galvez, M. (CHNE Univ. of New Mexico, Albuquerque, NM (US)); Barnes, C.; Gisler, G. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The authors report a two-dimensional electrostatic particle-in-cell code used to simulate the convection of a finite-slab of neutral plasma across a uniform magnetic field. The simulations show that the plasma is convected with a velocity that approaches the injection velocity for denser plasmas. The plasma losses p_y momentum with distance due to erosion effects. They have identified three mechanisms that cause erosion of the plasma: the erosion of the charge layers due to the velocity shear, the erosion of the charge layers due to their expansion along the magnetic field lines, and the erosion of the head of the stream due to Larmor-radius effects. The simulations also show that these erosions have greater effect for denser plasmas.

23168 Progress in ion beam research at Sandia National Laboratories. Stinnett, R.W.; Lockner, T.R.; Johnson, D.J.; Coats, R.S.; Mehlhorn, T.A.; Woodworth, J.R.; Leeper, R.J.; Desjarlais, M.P.; Bieg, K.W.; Pregenzer, A.L. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The authors report their progress in ion beam production and focusing in both radial focusing and extraction geometries. The voltage and current operating point of applied B ion diodes in both geometries can now be understood through consideration of the virtual cathode location, as determined from pressure balance. Enhanced ion current, depends sensitively on the magnetic field profile in the diode region. Experiments on Sandia's Particle Beam Fusion Accelerator (PBFA) II have demonstrated efficient ion beam generation, with 0.6 MJ of ions produced with 80% ion efficiency on experiments at the 3/4 energy level. With the flashover ion sources presently used on PBFA II, approximately half of the ion are protons. Horizontal FWHM proton focuses of approximately 5 mm have been obtained at diode voltages of over 5 MV. Experiments have revealed a linear scaling of FWHM with anode-cathode gap. Experiments and simulations have provided information on the effects of both solenoidal and self-field focusing in the diode.

23169 Theoretical analysis of wire-guided ion beam transport. Watrous, J. (JAYCOR, Vienna, VA (US)); Ottinger, P.F.; Mosher, D.; Neri, J.M. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Ion beam transport using a current carrying wire to provide an azimuthal confining magnetic field has been proposed for inertial confinement fusion applications. The authors discuss several aspects of this transport scheme investigated theoretically to determine whether or not the scheme is viable. An important issue is how much of the injected ion beam current can be successfully transported. Propagating beam ions execute betatron-like oscillations around the wire, and must have sufficient angular momentum to avoid collision with the wire. The fraction of the injected ion beam with sufficient angular momentum and with small enough radial excursion to match pellet dimensions is determined by the extraction ion diode focusing geometry, the wire size, and the current carried by the wire. A second issue is the length of the standoff, or ballistic drift region, between the end of the guide wire and the target. The 1/r dependence of the guide magnetic field causes ion trajectories to bend inward sharply close to the wire, indicating that the standoff could be severely limited. Because of packing constraints, the standoff determines the maximum number of beams that can be delivered to the target, which in turn determines the amount of current each beam must carry. Packing constraints also determine the positioning of the return current wires, which produce magnetic fields that can strongly influence the trajectories of beam ions. The advantages and disadvantages of the wire guided scheme are discussed and compared to the standard z-discharge transport scheme.

23170 Final focusing of Z-discharge transported ion beams. Neri, J.M. (Naval Research Lab., Washington, DC (USA). Plasma Physics Div.); Boller, J.R.; Cooperstein, G.; Mosher, D.; Ottinger,

P.F.; Scherrer, V.C.; Stephanakis, S.J.; Watrous, J.J.; Goodrich, P.J.; Hinshelwood, D.D. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

An experimental program is underway to demonstrate final focusing of transported ion beams. Z-discharge channels can be used to efficiently transport ion beams from the ion source to an ICF target, providing isolation and distance for time-of-flight power compression. Channel stability and beam energy loss constraints force a minimal channel diameter for a given ion beam power. Final focusing uses an additional short z-discharge with larger current to reduce the spot size of the ion beam from the channel diameter to the target diameter. Results and analysis of the program are presented.

23171 Plasma armatures in large bore launchers. Barber, J.P. (IAP Research, Inc., Dayton, OH (USA)); Marshall, R.A. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Almost all experimental observations of plasma armatures in railguns have been madein bores less than 20 mm in diameter. A serious velocity limiting interaction with the bore walls has been identified. The plasma radiates to the bore walls at power levels of several GW/m^2. The bore walls ablate and the ablated material enters the armature resulting in an apparent drag. In this paper, the authors examine the ablation induced drag as bore size is increased. Using a 3-D computational model they determine plasma temperature and pressure distributions. Bore wall ablation and drag are then computed. They find that plasma armature length and resistance increase only slowly with bore size. Radiant power densities do not change significantly and the deleterious affects of ablation induced drag decrease.

23172 Excitation of high frequency, electrostatic waves in the magnetospheres of the outer planets. Roth, I. (California Univ., Berkeley, CA (USA). Space Sciences Lab.). pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Observations of high frequency waves on board Voyager 1 and Voyager 2 satellites show that with their approach to Jupiter, Saturn and Uranus, electrostatic waves are excited within distances of ten planetary radii. Among the most prominent waves are the n + 1/2 cyclotron electron Bernstein modes. The most intense waves are excited intermittently at the local upper hybrid frequency. Although the actual values of the plasma and gyrofrequency vary in all three planets, their relative ratios are comparable. In this paper, a model of two electron populations, including cold thermal and hot electrons with a loss cone, is considered. It is shown that crossing of two kinetic eigenmodes is able to destablilize the system when the density of the hot distribution and its positive gradient in velocity space are sufficiently large. The effect of perturbations on the distribution function extends the unstable spectrum to higher frequencies above the upper hybrid while the waves below the upper hybrid are enhanced by thermal fluctuations. The nonlinear development is analyzed with the help of particle simulations.

23173 Design studies of an electrostatic quadrupole channel for transport of a high-brightness H^- beam and comparison with gas focusing. Chang, C.R. (Univ. of Maryland, MD (US)); Horowitz, E.; Reiser, M. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Transport of low-energy, high-brightness H^- beams from the ion source to the radio-frequency quadrupole (RFQ) accelerator requires the solution of several physics and engineering problems to avoid particle losses and emittance growth. The authors developed a conceptual design of an electrostatic quadrupole channel for transport of a 120 keV, 120 mA, H^- beam into a 425 MHz RFQ with low emittance growth and high transmission efficiency. This design satisfies several constraints imposed by voltage breakdown and beam optics considerations. The system will consist entirely of electrostatic lenses which prevent plasma build-up and eliminate possible emittance growth from plasma fluctuations. Pertinent design features a worst case non-linear analysis for the electrostatic quadrupole channel, and first results of a particle simulation code used to study beam loss and emittance growth are reported. As an alternative to the electrostatic quadrupole concept, gas focusing is being investigated for transporting low-energy H^- beams. Recent results from the numerical simulations of such a gas focussing channel are presented.

23174 Numerical simulation of plasmas on an unstructured grid. Drobot, A.T. (Science Applications International Corp., McLean, VA (US)); Friedman, A.; Fritts, M.J.; Lottati, I.; Nielsen, D. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The use of unstructured grids provides some inherent advantages in the accurate simulation of plasma problems which involve complex configurations and where the treatment of complicated boundaries is important. The use of a triangular grid in two dimensions, and of a tetrahedral grid with arbitrary connectivity in three dimensions, allows a straightforward representation of complex geometries and naturally allows the resolution of the mesh to vary according to the requirements of a problem. We have constructed a very simple and efficient data structure to represent unstructured grids for geometries with arbitrarily shaped boundaries. The data contains information about the location of vertices, edges, sides, and cells and permits with one degree of indirectness the implementation of algorithms for field solvers and for particle orbit integration. The numerical algorithms that have been constructed include a potential solver, an electromagnetic solver for both the time and frequency domain, and a particle-in-cell simulation. The efficiency and vectorization of the basic code functions are retained and yield timing results comparable with structured mesh codes. They describe the method of grid generation, the numerical algorithm's for a variety of applications, and present typical results. These include particle-in-cell plasma simulations as well as purely electromagnetic cases which illustrate powerful features of local grid refinement for cavity and scattering problems.

23175 Large high-field spaceborne experimental magnet systems: Design considerations. . Gaudreau, M.P.J. (Massachusetts Inst. of Tech., Cambridge, MA (USA). Plasma Fusion Center); Sullivan, J.D. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Currently, several programs are being planned which will place large high intensity magnets in low Earth orbit, i.e., inductive storage for electromagnetic launchers, magnetic spectrometers for cosmic ray studies, and artificial magnetospheres for plasma physics experiments. However, large high field magnets have yet to be operated in space, and possible environmental plasma effects of the magnets are open issues. In this paper the authors discuss design constraints for normal, superconducting, and permanent magnets from the perspective of possible precursors experiments appropriate for various space missions. For the magnetic field, the order (dipole, quadrupole), orientation with respect to Earth field and spacecraft, field intensity, and pulse shape discussed with respect to their impact on the spacecraft design, mission profile, and ground operations. Parametric optimization of the magnet system-cost, weight, size, power, intensity, and pulse shape flexibility are discussed, and estimated achievable performance for the various magnet systems and mission options are given.

23176 Dielectric-in-cell and N-body-dielectric simulations of $E\vec{}$ x $B\vec{}$ drifting plasma clouds. Hansen, P.J. (Iowa Univ., Iowa City, IA (USA). Dept. of Physics and Astronomy); Borovsky,

J.E. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Two computational methods for simulating E→ x B→ drifting plasma clouds are demonstrated. Both methods involve representing the plasma cloud by a large number of dielectric elements, each of which E→ x B→ drifts in a local electric field. This local electric field is the sum of an externally imposed uniform electric field and a polarization electric field. The local value of the polarization electric field depends on the configuration of the entire plasma cloud, hence it depends on the location of all of the dielectric elements that make up the cloud.

23177 **Predictions from the van der Pol equation applied to high power microwave phase-locking experiments at Physics International.** Price, D. (Physics International Co., San Leandro, CA (USA)). pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

In this paper, the van der Pol equation is evaluated as a model for an experiment in which a high power cavity vircator ws driven by a relativistic magnetron. It is shown that Adler's inequality gives a necessary but not sufficient condition to achieve phase locking between the driving magnetron and the driven vircator oscillations. The amplitude of the entrained oscillations is found as a function of the injected magnetron power, the initial frequency detuning and other system parameters. The stability of these oscillations is examined. Not all entrained states are stable. Boundaries between stable and unstable states are given. It is also shown that the driven oscillator can operate as a beat wave source. Predictions are compared to measurements to validate the model. A similar analysis is extended to two coupled van der Pol equations which model the PI, phase-locked relativistic magnetron experiments.

23178 **Efficiency optimization in a CARM amplifier.** Kho, T.H. (California Univ., Los Angeles, CA (USA). Dept. of Physics); Lin, A.T. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Computer simulations are used to examine the detailed physics of magnetic field tapering and frequency detuning in a CARM amplifier, and the dependence of its efficiency on electron beam current and input wave intensity. It is found that, depending on the initial frequency mismatch, tapering the magnetic field with either a negative or positive gradient can enhance the efficiency over that of the resonantly tuned CARM. The effects of different tapering strategies is presented. The ability of tapering to enhance the efficiency depends on the initial frequency mismatch; a physical explanation is presented for this observation. For a given set of parameters, the efficiency increases with beam current up to a critical current, beyond which the efficiency decreases with increasing current. The decrease in efficiency results from the dominance of force bunching over inertial bunching in the electron-wave interaction. In the force bunching regime, neither magnetic field tapering nor frequency detuning is effective in enhancing the efficiency.

23179 **Analysis and nonlinear simulation of quadrupole and dipole wiggler FELs for millimeter waves.** Chang, S.F. (Wisconsin Univ., Madison, WI (USA)); Scharer, J.E. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

An FEL amplifier with a helical quadrupole wiggler is investigated analytically and numerically. A 3-D simulation code is utilized to examine the nonlinear evolution of circular waveguide modes as well as the characteristics of relativistic particle motion, which illustrate a strong focusing effect. The simulation predicts a 0.55 dB/cm, 2% efficiency, and 8% bandwidth for the optimum TE_{21} mode at 300 GHz for a untapered wiggler. Mode competition for an over-moded waveguide and a nonlinear wiggler taper for efficiency enhancement are examined for a linear dipole wiggler in a rectangular guide. It is found that the maximum TE_{01} mode efficiency is 53% at 280 GHz and that the TM_{21} mode power can be as high as 28% in the constant wiggler level region. The dipole wiggler case is compared with that from the LLNL wiggler-averaged code WFEL.

23180 **High efficiency 1.7 GHz gyropeniotron amplifier.** Ganguly, A.K. (Naval Research Lab., Washington, DC (USA)); Ahn, S.; Zaidman, E. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Proposed applications require a highly efficient, high power source to drive accelerators in the .8 GHz - 1.7 GHz region. Klystrodes have produced power at 1 MW level at 0.45 Ghz with an efficiency in excess of 75%. It is, however, difficult to operate klystrodes in the frequency range of .8 GHz - 1.7GHz. The gyropeniotron is projected to operate at high frequencies with an efficiency in excess of 75%. The saturated power and efficiency of the gyropeniotron amplifier in a cylindrical waveguide with the slotted structure are calculated from a three-dimensional self-consistent theory. Design parameters are provided for a 1.7 GHz gyropeniotron operating in the 2nd cyclotron harmonic with a 100 kV, 10A beam. For an ideal axis-encircling beam, the calculated efficiency is 78%. For a realistic beam with 2% axial velocity spread and 5% guiding center spread, the efficiency is only reduced to 66%. The saturated power is 660 kW. Power in excess of 1 MW can be obtained with higher energy beam. Gyropeniotron amplifiers have potential for the required applications.

23181 **A review of the modeling of low pressure discharges for plasma chemistry and plasma processing.** Kushner, M.J. (Univ. of Illinois, Champaign, IL (US)); Kline, L.E. pp. 160 of Conference record of the 1988 IEEE international conference on plasma science (abstracts). IEEE Service Center, Piscataway, NJ (1988). (CONF-880651–: IEEE international conference on plasma science, Seattle, WA (USA), 6-8 Jun 1988).

Technical Paper 4B9.

The current state of the art in computer modeling of low pressure, non-equilibrium plasma processing is reviewed. Plasma deposition and etching of thin films for electronic applications are emphasized. The authors describe the current progress towards first principles models which use basic data describing electron-molecule interactions, gas phase reactions, and surface chemical reactions to predict the behavior of these plasma processes as a function of controllable process parameters. The present models are discussed in terms of three submodels: discharge electron kinetics models, chemical kinetics models, and surface kinetics models. For each submodel they discuss the numerical techniques, input data, predicted parameters, and comparison to experiment. The relationships between submodels are also discussed.

23182 **Low-Z gas puff implosions.** Hsing, W.W. (Sandia National Labs. (US)); Porter, J.L.; Spielman, R.B. pp. 160 of Conference record of the 1988 IEEE international conference on plasma science (abstracts). IEEE Service Center, Piscataway, NJ (1988). DOE Contract AC04-76DP00789. (CONF-880651–: IEEE international conference on plasma science, Seattle, WA (USA), 6-8 Jun 1988).

Technical Paper 2P50.

The authors have imploded helium gas puffs on the 2Ω Supermite accelerator (1.3 MA, 80 nsec implosion time) and measured the stagnation characteristics both in the presence and absence of a target. The target consisted of 1000 A of Al coated over a 2-μm-thick, 3-mm-diameter annulus of parylene. They have measured the radiation using bolometers, XRDs, photoconductive detectors and a time-resolved x-ray pinhole camera. They have observed a well-defined region of stagnation in the absence of a target. In the presence of a target, they have measured the K-shell aluminum radiation created by the stagnation of the helium onto the target. They compare the stagnation characteristics of helium with the stagnation of neon and nitrogen.

23183 Two-dimensional simulations of imploding gas puff plasmas. Roderick, N.F. (New Mexico Univ., Albuquerque, NM (USA)); Hussey, T.W. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). DOE Contract AC04-76DP00789. (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The authors report two dimensional single fluid magnetohydrodynamic simulations conducted to investigate short wave length and long wavelength disturbances of gas puff plasma implosions including the effects of gas injection and power flow to the plasma annulus. The numerical calculations were carried out using the two-dimensional single-fluid MHD code MACH2 for different plasma density profiles and electrode geometries. Results show the effects of long wave length disturbances resulting from the gas injection and short wavelength instabilities resulting from instabilities of the plasma magnetic field interface.

23184 Nonlinear studies of axis-encircling electron beam with off-centering and field tapering effects. Ayres, V. (Naval Surface Warfare Center, Silver Spring, MD (USA)); Choe, J.; Boulais, K.; Uhm, H. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

A self-consistent nonlinear analysis of an axis-encircling electron beam in a vane circuit oscillator has been developed. From this analysis, optimized quantities with respect to energy, current, vane depth, and magnetic field are determined and compared with experiment in this paper. The analysis also includes more realistic parameters, such as the off-centering effect and the tapering of the magnetic field. These are investigated within the following context. Efficient production of radiation by both cusptron (via the negative mass instability) and peniotron mechanisms depends critically on the electron beam quality. For the cusptron, the off-centering is always damaging. The cyclotron motion does not coincide with the system azimuthal direction, therefore energy conversion to the azimuthal RF wave is less efficient. Magnetic tapering is investigated both as a realistic experimental parameter and for the purposes of designing an adiabatic compression (to reduce the size of the beam to a more favorable interaction position). It has been shown that adiabatic compression actually reduces the off-centering effect. An ideal adiabatic compression is discussed.

23185 Small and large versions of the IGNITEX experiment. Montalvo, E. (Texas Univ., Austin, TX (USA)); Carrera, R.; Rosenbluth, M.N. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Small and large versions of the basic IGNITEX ignition experiment are proposed and analyzed. The philosophy that supports both concepts is explained. The basic IGNITEX machine is a high field (B=20T) compact, single-turn tokamak (R=1.5m).with high plasma current (I = 12 MA) This tokamak machine uses unconventional magnet and power supply systems that allow the generation of the high magnetic field required for ohmic ignition. The design is based on the assumption that Kaye-Goldston (L-mode) energy confinement time scaling represents adequately the possible confinement degradation induced by alpha particle heating. The machine is designed to provide high ignition margin and a wide operational range of densities and temperatures within the constraints of stability, disruption limits, and total length of the discharge. The physics aspects of the experiment have been extensively studied. The results indicate good experimental characteristics for plasma equilibrium and stability and for alpha particle containment. The experiment at the time of ignition is described. The basic IGNITEX experiment has high ignition margin for present scaling expressions but it is not designed to ignite under the more pessimistic Goldston scaling. The descriptions of the large and small IGNETIX devices are presented. Their characteristics and preliminary analysis are given. Design modularity is emphasized.

23186 In-vessel maintenance on the IGNITEX experiment. Ling, J. (Texas Univ., Austin, TX (USA)); Barrington, M.; Carrera, R.; Tesar, D. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The fusion experiment IGNITEX uses a single-turn-coil- tokamak to reach ignition conditions in a deuterium-tritium plasma. Because of the high energy neutrons produced during plasma ignition, the in-vessel zone of the device will become highly activated during the DT phrase of the experiment. The in-vessel remote maintenance system (IVRMS) is described. It should permit maintenance of the first-wall system as needed for the adequate operation of the ignition tokamak. The essential tasks to be performed by the IVRMS are: inspection of first wall and diagnostic penetrations, for damage and vacuum leaks; and repair of damaged areas by welding and beryllium-spray-coating techniques.

23187 Vacuum and fueling systems for the IGNITEX experiment. Hallock, G. (Texas Univ., Austin, TX (USA)); Booth, W.D.; Carrera, R. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The results of preliminary studies of the vacuum and fueling requirements for the proposed fusion ignition experiment IGNITEX are presented. An initial design for the vacuum pumping and plasma fueling system is given. The IGNITEX vacuum system must meet the demands of providing sufficient pumping speed to reach a base pressure of about 10^{-8} Torr to provide a clean environment for plasma formation. In addition, the pumping speed should meet the requirements during the discharge cleaning cycle. The design of the vacuum pumping system including layout and location and structure of the vacuum ports required for pumping and diagnostic access is presented. Two different types of pumping systems - turbomolecular pumps and cryrogenic pumps have been considered. The advantages and disadvantages of each type of pumping system are analyzed.

23188 SRX- precursor to large scale high beta plasma devices. Mendelsohn, S. (Grumman Corp., Plainsboro, NJ (USA). Corporate Research Center); Todd, A.M.M.; Wexler, H.; Navratil, G.A. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The authors describe a second regime experiment and present calculations illustrating several possible operating scenarios, external and internal mode stability boundaries and other experimental features needed to evaluate and test high beta tokamak theories. Access to and operation in the second regime employing a large aspect ratio range (R/a = 6 to 9) device is discussed. Large aspect ratio was chosen to reduce required heating power for second regime studies and to permit large aspect ratio confinement experiments under ohmic, NBI, and ECH heating conditions. In addition, it leads to simplified machine geometry based on reduced stress from relatively low values of plasma current and magnetic field strength. Design features include an inside null divertor for possible confinement advantages of H-mode operation, to test divertor physics at high beta and to provide added flexibility to control the plasma boundary. A close-fitting, adjustable conducting shell providing stabilization against external modes will allow study of wall-plasma separation effects and permit R/a variation.

23189 Operation of the IGNITEX tokamak. Eways, S.; Carrera, R.; Dong, J.; Hallock, G.; Montalvo, E. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The fusion ignition experiment IGNITEX will use a single-turn tokamak to produce and control ignited plasmas by heating a fuel

mixture with ohmic heating alone. The operations of the IGNITEX tokamak from breakdown to shut down is described. The pulse length of the discharge is extended by precooling the magnet structure to liquid nitrogen temperature between pulses. The use of RF cavity resonance to breakdown the neutral gas and initiate the plasma discharge in a controllable and reproducible way is analyzed. A relatively low power, moderate frequency RF field at a toroidal cavity resonance mode should build up a sufficient electric field strength to produce an RF discharge at high density. The potential advantages of breaking down the gas by resonant cavity modes in the IGNITEX tokamak are discussed.

23190 **Design of a laser-produced lithium anode plasma experiment on the Helia extraction diode.** Bieg, K.W. (Sandia National Labs., Albuquerque, NM (USA)); Tisone, G.C.; Bailey, J.E.; Hamil, R.A. pp. 180 of Proceedings of the 1989 IEEE international conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (1989). DOE Contract AC04-76DP00789. (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Recent experimental evidence on PBFA II has suggested that poor source turn-on and nonuniformity may contribute to the late focusability achieved with passive lithium ion sources to date, further emphasizing the need for a pre-formed anode plasma. The BOLVAPS/LIBORS ion source, now under development, is such an active source but poses some formidable technical challenges. As a result, the authors are proposing to field a direct laser-produced lithium anode plasma source on the Helia extraction diode experiment, with eventual application to PBFA II. Previous experiments have shown that a high-density lithium plasma can be produced by direct laser irradiation of a solid lithium surface with a pulsed dye laser (LIBORS) tuned to the Li I 2s-2p resonance line (670.8 nm). These measurements have also suggested that the plasma formation process, and therefore the laser energy requirement, is dominated by the thermal energy required for vaporization with the long-pulse (1 μsec) LIBORS laser. The authors discuss how they developed a simple model of this process and have investigated the effects of laser pulse length, lithium film thickness, substrate material, and laser wavelength on the threshold for lithium plasma production.

23191 **Phase locking of ultra-high power relativistic magnetrons.** Sze, H. (Physics International Co., San Leandro, CA (US)); Benford, J.; Smith, R.R.; Woo, W. pp. 160 of Conference record of the 1988 IEEE international conference on plasma science (abstracts). IEEE Service Center, Piscataway, NJ (1988). (CONF-880651–: IEEE international conference on plasma science, Seattle, WA (USA), 6-8 Jun 1988).

Technical Paper 5B8.

Phase locking of ultra-high power ($\geq$ GW) microwave oscillations has been achieved. In this article, the authors present experimental and theoretical results of an on-going program to investigate the feasibility of phase-locking of two simultaneously driven relativistic magnetrons. Theoretically, they discuss phenomenological modeling using relativistic pulse shapes. Experimentally, they describe experimental setup and operating characteristics, examine locking criteria, present temporal phase measurements, and compare with analytical results of the phenomenological modeling.

23192 **Pulsed power driven x-ray laser research at Physics International Company.** Nash, T. (Physics International Co., San Leandro, CA (US)); LePell, P.D.; Krishnan, M. vp. of Conference record of the 1988 IEEE international conference on plasma science (abstracts). IEEE Service Center, Piscataway, NJ (1988). (CONF-880651–: IEEE international conference on plasma science, Seattle, WA (USA), 6-8 Jun 1988).

Technical Paper 5A7.

The DNA/PITHON generator was used to produce hot, dense plasmas in z-pinch configurations. Up to 50 MM long, 1 mm diameter plasmas of Kr, Al, Na and other species were produced, with densities N_e - 10^{20} cm^{-3} and temperatures T – 300-800eV. Time and space resolved spectral measurements were made of these plasmas using x-ray crystal and XUV (MCPIGS) spectrographs and x-ray pinhole framing cameras. Several x-ray laser schemes were explored: collisionally pumped, Ne-like lasers; three-body recombination lasers in H-like and Li-like ions; and resonant photo-excitation of NeIV by NaX line radiation. The results of these ongoing experiments and their implications for future research are presented and discussed.

23193 **The pulsed power systems for the LSX field reversed configuration experiment.** McDonald, K.F. (Spectra Technology, Inc., Bellevue, WA (USA)); Mayerchak, M.A.; Dettart, T.E.; Hedeen, P.F.; Hoffman, A.L. pp. 758 of Proceedings of the sixth IEEE pulsed power conference (technical papers). Bernstein, B.H.; Turchi, P.J. American Society for Surface Mining and Reclamation, Princeton, WV (1987). (CONF-870656–: 6. Institute of Electrical and Electronic Engineers pulsed power conference, Arlington, VA (USA), 29 Jun - 1 jul 1987).

This paper reports on a reversed-field theta pinch experiment, called LSX (large s experiment), to generate field reversed configurations (FRC) of reactor relevant sizes. The principal parameters of the device are a set of single turn theta coils of 0.9 m diameter, with a total length of 4.5 m. The peak forward field is 7.5 kG, applied with a 25 μsec risetime. The FRCs will be formed using slow, programmed formation techniques which rely upn ohmic heating and axial compression heating rather than the more standard theta pinch method of radial shock heating. LSX's basic engineering features are reverse bias and forward field capacitor banks, programmed formation end coils and power supplies, multipole flux retention and stabilization fields, preionization sources, and the necessary ancillary systems. The authors provide an overview of the LSX physics, discuss the operating modes and design philosophy, describe the capacitor banks, energy storge modules and ancillary systems, and discuss the fault prevention techniques and fault sequences.

23194 **Performance of the Laguna pulsed power system.** Goforth, J.H. (Los Alamos National Lab., NM (USA)); Caird, R.S.; Fowler, C.M.; Greene, A.E.; Kruse, H.W.; Lindemuth, I.R.; Oona, H.; Reinovsky, R.E. pp. 758 of Proceedings of the sixth IEEE pulsed power conference (technical papers). Bernstein, B.H.; Turchi, P.J. American Society for Surface Mining and Reclamation, Princeton, WV (1987). (CONF-870656–: 6. Institute of Electrical and Electronic Engineers pulsed power conference, Arlington, VA (USA), 29 Jun - 1 jul 1987).

The goal of the LAGUNA experimental series is to accelerate an annular aluminum plasma z-pinch to greater than one hundred kilojoules of implosion kinetic energy. To accomplish this, an electrical pulse >5.5 MA must be delivered to a 20 nH load in –1 μs. The pulsed power system for these experiments consists of a capacitor bank for initial energy storage, a helical explosive-driven magnetic-flux compression generator for the prime power supply and opening and closing switches for power conditioning. While the authors have not yet achieved their design goal of 15 MA delivered to the inductive store of the system, all major components have functioned successfully at the 10 MA level. Successes and difficulties experienced in these experiments are described.

23195 **A low inductance vacuum convolute for Z-pinch research.** Spielman, R.B. (Sandia National Labs., Albuquerque, NM (USA)); Hsing, W.W.; McDaniel, D.H.; Spence, P.W.; Nielsen, K.E. pp. 758 of Proceedings of the sixth IEEE pulsed power conference (technical papers). Bernstein, B.H.; Turchi, P.J. American Society for Surface Mining and Reclamation, Princeton, WV (1987). DOE Contract AC04-76DP00789. (CONF-870656–: 6. Institute of Electrical and Electronic Engineers pulsed power conference, Arlington, VA (USA), 29 Jun - 1 jul 1987).

The authors discuss how they tested a low inductance, vacuum convolute for driving Z-pinch loads on Proto-II. The Proto-II vacuum section has four separate insulator stacks (1 m dia., 16 cm high) feeding four disk feeds. These disk feeds are coupled together by twelve, vertical magnetically-insulated transmission lines (MITLs) that are, in turn, convoluted into a single-disk MITL near the load. This convolute adds all of the inductance of the individual feeds in parallel, resulting in a total system inductance of 6.5 nH and short circuit currents as great as 9 MA. The vertical-to-disk convolute includes regions of poor magnetic insulation, which result in significant electron losses for the Z-pinch loads.

23197 (AERE-OR/EMS–16) **Health Physics, Safety and Medical Services report for 1988.** Burt, A.K.; Bird, R.W. UKAEA Harwell Lab. (UK). Environmental and Medical Science Div. Aug 1989. 73p. Order Number DE90620439. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

This annual report summarizes Health Physics and Medical Services activities at Harwell Laboratory. Topics covered include liaison with emergency authorities, organization, policy, training and staffing problems, major changes to plant and the decommissioning projects. Monitoring of the working environment and that surrounding the Laboratory are discussed, together with surface contamination and waste disposal. Summaries of doses for 1988, and cumulative doses in selected buildings for Harwell staff and contractors are presented in tabular form and a summary of attendance for medical treatment is also given. (UK).

23198 (CONF-900566–1) **Research and development quality assurance planning.** Hoke, P.B. Oak Ridge National Lab., TN (USA). 14 May 1990. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 1990 American Society for Quality Control (ASQC) congress; San Francisco, CA (USA); 14 May 1990. Order Number DE90003687. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Planning for quality assurance (QA) in research and development (R & D) is like stealing eggs without waking up the chickens. The QA program should be as unobtrusive as possible. Researchers require a QA program that affords them an environment capable of supporting repeatable experiments with accurate data without unduly stifling their creative abilities. Careful advance planning ensures that the intensity of control provided by quality-related systems is commensurate with the importance and scope of the activities being performed. Good scientific practices applied to small bench-scale projects may require minimal additional controls. As projects increase in size and complexity the controls imposed through planning must, by necessity, be increased. Research and development QA planning, just like any other planning, involves all affected individuals. The application of control systems is determined by factors such as customer or sponsor requirements, the importance of an item or activity to the experiment's success, and the organizational complexity of the project. Many larger experiments are highly dependent on quality-related support activities such as calibration, engineering design, and inspection provided by organizations outside the R & D group. Since, in most cases, the expense of support activities is taken directly from funds available for research, it is important for the researchers to be involved in the planning efforts to help determine and agree with the level of QA effort required. A single plan will often suffice for organizations engaged in large numbers of similar experiments. Complex experiments may require unique QA plans or additions to existing plans. Once implemented, the R & D QA plans, like any others, require audits or surveillances and may require revisions if the scope of the experiment changes. 1 ref., 1 fig.

23199 (SAND–89-2698) **PC-based information systems used in planning and coordinating the Building 823 exclusion from Tech Area 1.** Tolendino, C.D. Sandia National Labs., Albuquerque, NM (USA). Feb 1990. 49p. Sponsored by U.S. DOE Management & Administration. DOE Contract AC04-76DP00789. Order Number DE90008133. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report describes the application of word processing, graphics and data base software to the task necessary for the exclusion of Building 823 from the secure technical area at Sandia National Laboratories. In particular, this report focuses on the development of the building floor plans layouts and the space/personnel data base which were used by management to plan and coordinate the project. Once the project is complete, these information systems will continue to be maintained by other personnel for administrative purposes. The software developed has potential applicability to other facilities where administrative monitoring or space assessment is required. 6 figs.

23200 (SAND–89-2700C) **Analysis of software for security-critical systems.** Axline, R.M. Jr.; Smith, R.E.; Grady, M.F.; Barger, T.I. Sandia National Labs., Albuquerque, NM (USA). [1989]. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-9005106–1: 13. annual conference of the Computer Security Group, Augusta, GA (USA), 8-10 May 1990). Order Number DE90007286. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Sandia National Laboratories (SNL) performs software security analyses of many systems having strong security requirements. This paper gives an overview of a software security analysis methodology that has evolved at SNL. This methodology is based on experience gained in the analysis of critical software-controlled systems. The paper describes analysis activities and how they relate to the traditional software life cycle. Topics discussed include: planning for the analysis; supporting the development and documentation of security requirements; identifying and analyzing the threat; acquiring and utilizing software design and implementation materials; identifying positive design features; scaling the analysis effort to the threat; analyzing the high-level design; analyzing the source-code and target implementations; reporting results; interacting with system and component development groups; and supporting the authentication of the software product before it is fielded. The paper also stresses the importance of independence of analysis and development groups.

23201 (UCRL–101159) **How to select members for an audit team.** Dronkers, J.J. Lawrence Livermore National Lab., CA (USA). Jan 1990. 17p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-900566–2: 1990 American Society for Quality Control (ASQC) congress, San Francisco, CA (USA), 14 May 1990). Order Number DE90008320. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In this paper we will consider the putting together of an audit team. Actually a more formal way to state this is that in this paper we will consider the selection of the members of an audit team. The formal way makes certain implicit assumptions. First, that there is an audit team, or, to put it differently, audits are done by more than one person. Second, that there is a selection process. That is, there is a method by which a few persons are chosen in preference over other persons to come and do an audit. 12 refs.

23202 (AD-A–214481/4/XAB) **Vision-based navigation and parallel computing. Annual report No. 1, May 1988-May 1989.** Davis, L.S.; DeMenthon, D.; Bestul, T.; Harwood, D. Maryland Univ., College Park, MD (USA). Center for Automation Research. Aug 1989. 54p. Available from NTIS, PC A04/MF A01.

This report describes research performed during the period May 1988-May 1989 under DARPA support. The report contains discussion of four main topics: (1) On-going research on visual navigation, focusing on a system named RAMBO, for the study of robots acting on moving bodies; (2) Development and implementation of parallel algorithms for image processing and computer vision on the Connection Machine and the Butterfly; (3) Development of parallel heuristic search algorithms on the Butterfly that have linear speedup properties over a wide range of problem sizes and machine sizes; and (4) Development of Connection Machine algorithms for matrix operations that are key computational steps in many image processing and computer-vision algorithms. This research has resulted in twelve technical reports, and several publications in conferences and workshops.

23203 (AD-A–214502/7/XAB) **Hybrid (optical/electronic) computing and digital optical computing. Final report, 1 September 1985-31 August 1988.** Lee, S.H. California Univ., San Diego, CA (USA). 31 Aug 1988. 29p. Available from NTIS, PC A03/MF A01.

Hybrid optical-analog/electronic computing is performed for optical image processing, optical pattern recognition, and optical solution of partial differential equations. For example, image processing designed and fabricated space-variant filters to optically implement numerous space-variant transformation (e.g., Hough transform for detection of high-order parametric curves, coordinate transforms to detect rotation and scale-invariant features of images, etc.). For spike removal from noisy images, one can develop a new parallel algorithm suitable for optical/analog/electronic hybrid implementation. This parallel algorithm is space-variant and performs better than the space-invariant low-pass filter and the time-consuming median filter. Digital optical computing research develops nonlinear optical devices and studies their uses in parallel architectures for implementation of parallel algorithms. The nonlinear optical devices are based on integrating silicon with PLZT. LPCVD techniques to deposit polycrystalline Si onto the electro-optic PLZT substrate and then recrystallizing the polysilicon using an Ar+ laser are used to produce single crystal silicon grains, to fabricate and test a 12 x 12 electrically addressed spatial light modulator (SLM) array and a 16 x 16 optically addressed SLM array. Optical parallel computing architectures are investigated by different interconnection topologies and holographic optical elements are generated to implement fully interconnected and hypercube interconnected topologies.

23204 (AD-A–214627/2/XAB) **Parallel functional computation. Final report, 15 June 1986-14 August 1989.** Oldehoeft, R.R. Colorado State Univ., Fort Collins, CO (USA). 9 Nov 1989. 13p. Available from NTIS, PC A03/MF A01.

The magnitude of problems that people need to solve using automatic computation often exceeds the processing power of available sequential computers. However, most algorithms contain components that can execute concurrently instead of serially, and vendors have provided a variety of machines capable of parallel processing. But expected reductions in execution times did not always occur owing to ineffective utilization of available parallel hardware or excessive interprocessor communication. Programmers could sometimes manually optimize program structures to solve these problems, but this work is extraordinarily difficult, and not practical for large programs. Research into automatic parallelization follows two paths. First, because of the large investment in extant software, attempts continue toward compilers for conventional languages that map ordinary programs onto parallel architectures efficiently. Systems of this kind work best when programmers use certain easily recognizable forms in source programs and understand underlying parallel hardware. Second, research continues in this and other projects to design, implement, and evaluate new languages for which automatic parallel execution is more easily attainable.

23205 (AD-A–214635/5/XAB) **Parallel logic programming and parallel systems software and hardware. Progress report (Final), 1 April 1988-31 March 1989.** Minker, J. Maryland Univ., College Park, MD (USA). Dept. of Computer Science. 29 Jul 1989. 17p. Available from NTIS, PC A03/MF A01.

This progress report summarizes work performed under AFOSR-88-0152 on parallel logic programming, problem solving, and deductive data bases. A parallel problem-solving system, PRISM (Parallel Inference System), that was implemented on McMOB was ported to the BBN Butterfly machine. Two versions of PRISM were developed and are operational on the Butterfly: a message-passing ring-structure system and a shared-memory system. Experimental testing of PRISM on McMOB continued, while experiments were also conducted on the Butterfly systems. Three enhancements were made and completed during the grant period. These are: a capability to handle negated queries and a capability to assert and retract statements. In addition to the above, work continued in the area of informative answers to queries in deductive data bases. A thesis was completed on the subject. An interpreter was developed and is running, that can take restricted natural language as input and can respond with a cooperative natural language output. In the area of parallel software development, the following were accomplished. Theoretical work on slicing/splicing was completed. Tools were provided for software development using artificial-intelligence techniques. AI software for massively parallel architectures was started.

23206 (AD-A–214810/4/XAB) **Genetic adaptive system for image understanding and learning research. Phase 1. Final technical report, 1 February-1 August 1989.** Douthat, D.Z.; Ross, K.W. Institute for the Study of Intelligent Systems, Ann Arbor, MI (USA). Aug 1989. 28p. (ISIS–10037U/89-02C). Available from NTIS, PC A03/MF A01.

Original contains color plates: All DTIC and NTIS reproductions will be in black and white.

This report documents the efforts and results of initial phase research on machine learning directed at application for real-time machine vision and automatic target recognition. The particular paradigm pursued is based on genetic algorithms and classifiers modeled on the summation of Mendelian genetic recombination, Darwinian selection, and ecological notions of competition. This machine-learning approach is strongly supported by sound statistical theory. A second thread of research was the development of massively parallel computing hardware based on the Geometric/Arithmetic Parallel Processor (GAPP). This machine has a large number of processors, each one bit wide with a full Arithmetic/Logic Unit (full adder) and with local memory per processor. The basic research hypothesis of the subject effort has been that GAPP contained sufficient hardware capability to provide a substrate for a Classifier and Genetic Algorithm system. The goal has been demonstrated by constructing and running the necessary software on the GAPP, its controller and its host. The resulting fusion of software and hardware is called a Genetic Algorithm/Classifier Engine (GACE) in the same sense as a LISP engine or a data base engine. The resulting quantum jump in performance should open doors both to application and to more interesting and relevant research.

23207 (AD-A–214910/2/XAB) **Theory for graph-based language specification, analysis, and mapping with application to the development of parallel software. Doctoral thesis.** Bailor, P.D. Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering. Sep 1989. 516p. (AFIT/DS/ENG–89-1). Available from NTIS, PC A22/MF A03.

Ageneralized formal language theory model and associated theorems were developed for the specification, analysis, and mapping of graphs and graph-based languages. The developed model, defined as a graph-generative system, is analyzed from a set theoretic, formal language, algebraic, and abstract automata perspective. As a result of the analysis, numerous theorems pertaining to the properties of the model, graphs, and graph-based languages are derived. The graph generative system model also serves as the basis for applying graph based languages to areas such as the specification and design of software and visual programming. The specific application area emphasized is the use of graph-based languages as user-friendly interfaces for wide-spectrum languages that include structures for representing parallelism. The goal of this approach is to provide an effective, efficient, and formal method for the specification, design, and rapid prototyping of parallel software. To demonstrate the theory's utility and the feasibility of the application, two models of parallel computation are chosen. The widely used Petri net model of parallel computation is formalized as a

graph-based language. The Petri net syntax is formally mapped into the corresponding syntax of a Communicating Sequential Processes(CSP) model of parallel computation where CSP is used as the formalism for extended wide-spectrum languages. Finally, the Petri net to CSP mapping is analyzed to demonstrate that the CSP specification formally behaves in a manner equivalent to the Petri net model.

23208 (ANL/TM–379-Rev.2) **Recommended documentation for computer users at ANL: Revision 2.** Caruthers, C.M.; Opitz, L.C. Argonne National Lab., IL (USA). Feb 1990. 96p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. Order Number DE90008137. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

Recommended Documentation for Computer Users at ANL is for all users of the services available from the Argonne National Laboratory Computing and Telecommunications Division. This manual will guide you in selecting available documentation that will best fill your particular needs. Chapter 1 tells you how to use this document to select manuals and how to obtain them from the Computing and Telecommunications Document Distribution Counter. Chapter 2 contains tables that categorize available publications and identify available computer systems, applications, languages, and libraries. It serves as a rationale for the groupings of documents in Chapter 3. Chapter 3 lists publications by subject, with annotations indicating the skill level. Parts I and VIII cover publications of a general nature and publications on telecommunications and networks, respectively. Parts II, III, IV, V, VI, VII, and IX cover publications on specific computer systems. Chapter 4 contains abstracts of each publication, arranged alphabetically. Chapter 5 describes additional publications that contain bibliographies and master indices.

23209 (CONF-891273–2) **Performance characterization research at Oak Ridge National Laboratory.** Worley, P.H.; Heath, M.T. Oak Ridge National Lab., TN (USA). [1989]. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 4. SIAM conference on parallel processing for scientific computing; Chicago, IL (USA); 11-13 Dec 1989. Order Number DE90008745. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Research in performance characterization at Oak Ridge National Laboratory is focused on providing tools for analyzing and modeling the behavior of parallel algorithms on parallel architectures. The ultimate goal is to attain a deeper understanding of the complex interaction between parallel algorithms and architectures in order to improve performance on existing architectures and to predict performance as an aid to designing new architectures. In this paper, we describe our approach and the current status of the research. 1 ref., 3 figs.

23210 (CONF-900290–2) **Hybrid Intelligent Perception System: Intelligent perception through combining Artificial Neural Networks and an Expert System.** Glover, C.W.; Spelt, P.F. Oak Ridge National Lab., TN (USA). [1990]. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 1. workshop on neural networks: academic/industrial/NASA/defense; Auburn, AL (USA); 5-6 Feb 1990. Order Number DE90007483. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This paper presents a report of work-in-progress on a project to combine Artificial Neural Networks (ANNs) and Expert Systems (ESs) into a hybrid, self-improving pattern recognition system. The purpose of this project is to explore methods of combining multiple classifiers into a Hybrid Intelligent Perception (HIP) System. The central research issue to be addressed for a multiclassifier hybrid system is whether such a system can perform better than the two classifiers taken by themselves. ANNs and ESs have different strengths and weaknesses, which are being exploited in this project in such a way that they are complementary to each other: Strengths in one system make up for weaknesses in the other, and vice versa. There is presently considerable interest in the AI community in ways to exploit the strengths of these methodologies to produce an intelligent system which is more robust and flexible than one using either technology alone. Perception, which involves both data-driven (bottom-up) and concept-driven (top-down) processing, is a process which seems especially well-suited to displaying the capabilities of such a hybrid system. This work has been funded for the past six months by an Oak Ridge National Laboratory seed grant, and most of the system components are operating in both the PC and the hypercube computer environments. Here we report on the efforts to develop the low-level ANNs and a graphic representation of their knowledge, and discuss ways of using an ES to integrate and supervise the entire system. 11 refs., 3 figs.

23211 (DOE/ER/25015–29) **Computation and graphics in mathematical research: Progress report, June 1, 1989–May 31, 1990.** Hoffman, D.A.; Spruck, J. Massachusetts Univ., Amherst, MA (USA). Jan 1990. 22p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-86ER25015. Order Number DE90008429. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We are actively developing and using interactive graphics software and numerical computation to study problems in global differential geometry and calculus of variations, the structure and motion of interfaces, and the simulation of plasma equilibrium and evolution. We have improved the hardware, software and design of our video animation facility and have begun to document our graphics software packages. 39 refs.

23212 (DOE/ER/25029–2) **Computer Science and Technology Board: Summary of activities, March 15, 1989–March 14, 1990.** Blumenthal, M.S. National Academy of Sciences - National Research Council, Washington, DC (USA). [1990]. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-87ER25029. Order Number DE90008292. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Computer Science and Technology Board (CSTB) meets three times a year to consider scientific and policy issues in computer science as well as relevant problems in associated technologies. The objectives of the Board include: initiating studies involving computer science and technology as a critical national resource; responding to requests from the government, nonprofit foundations, and industry for advice on computer science and technology; promoting the health of the technology and other fields of pure and applied science and technology; and providing a base of expertise within the NRC in the area of computer science and technology.

23213 (JAERI-M–89-145) **A computer code TERFOC-N to calculate doses to the public due to atmospheric releases of radionuclides in normal operations of nuclear facilities.** Togawa, Orihiko (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Oct 1989. 96p. (In Japanese). Order Number DE90759882. Available from NTIS (US Sales Only), PC A05/MF A01.

A computer code TERFOC-N has been developed to calculate doses to the public due to atmospheric releases of radionuclides in normal operations of nuclear facilities. This code calculates the highest individual dose and the collective dose from 4 exposure pathway; internal doses from ingestion and inhalation, external doses from cloudshine and groundshine. Foodchain models, which are originally referred to the U. S. Nuclear Regulatory Guide 1.109, have been improved to apply not only LWRs but also to other nuclear facilities. This report describes the employed models and the computer code, and gives a sample run performed by this code. (author).

23214 (JAERI-M–89-153) **Computation of synchrotron radiation from bending magnet and wiggler.** Sasaki, Shigemi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment (Japan)). Japan Atomic Energy Research Inst., Tokyo (Japan). Oct 1989. 44p. Order Number DE90759884. Available from NTIS (US Sales Only), PC A03/MF A01.

The programs for the VAX/MicroVAX computer were written in order to calculate various differential and total fluxes of synchrotron radiation from bending magnet and wiggler. These computer programs are here listed. (1) Vertical angular dependences of 'brightness' (angular flux density) and degree of circular polarization for a bending magnet case. [photons/s/mrad^2/0.1 %b.w./mA]. (2) Flux spectrum for a bending magnet or a wiggler case. [photons/s/mrad/0.1 %b.w./mA]. (3) Spectral brightness for a bending magnet or a wiggler case. [photons/s/mrad^2/0.1 %b.w./mA]. (4)

Spectral brilliance for a bending magnet or a wiggler case. [photons/s/mrad^2/mm^2/0.1 %b.w.]. (5) Angular dependences of flux and percentage of circular polarization for a bending magnet case. (Flux of elliptically polarized photon.) [photons/s/mrad/0.1 %b.w.]. (6) Flux through a slit. [photons/s/0.1 %b.w.]. (7) Flux spectrum through a slit. [photons/s/0.1 %b.w.]. (8) Integrated flux through a slit. [photons/s]. The calculated parameters will be useful for practical synchrotron radiation users. (author).

23215 (LA–11772-MS) **Experiments in finding neural network weights.** Thomas, T.R.; Brewster, T.L. Los Alamos National Lab., NM (USA). Apr 1990. 10p. Sponsored by U.S. DOE Management & Administration. DOE Contract W-7405-ENG-36. Order Number DE90007696. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report compares the speed with which back-propagation, conjugate gradient, and Quickprop algorithms find the neural network weights that solve: a small-scale nonlinear classification problem and a mapping from a vector-valued time series to a one-dimensional signal. The problem of tuning each algorithm for these problems (i.e., selecting a good set of control parameters) is also discussed. The most efficient algorithm was found to be an enhanced form of back-propagation using large momentum and learning rates, with weight updates after each pattern presentation and a small constant added to the error derivatives. 3 refs., 6 tabs.

23216 (LAL–88-52) **Use of an IBM -FPS loosely coupled array of processors for high energy physics programs.** Grosdidier, G. Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire. Sep 1988. 25p. Order Number DE90756347. Available from NTIS (US Sales Only), PC A03/MF A01.

An heterogeneous system based on the coupling of an IBM host computer and several FPS attached processors has been set up in the IBM Kingston research center. This system named loosely Coupled Array of Processors, is based on the use of separate processors for parallel processing of nearly independent computing sequences inside the same program. Such a system is well suited to several High Energy Physics applications, for instance Monte Carlo simulation and event reconstruction. One example of each kind has been implemented on this system, and benchmark tests achieved. Speed-up performance figures are given, as well as a comparison with some standard sequential mainframes. The ICAP operating system is discussed from a user's point of view.

23217 (LA-UR–89-2722) **Bulletin: An authoring and change control tool.** Sanders, C.E. (Los Alamos National Lab., NM (USA)). Los Alamos National Lab., NM (USA). [1989]. 5p. Sponsored by U.S. DOE Management & Administration. DOE Contract W-7405-ENG-36. (CONF-900532–2: 37. international technical communications conference, Santa Clara, CA (USA), 20-23 May 1990). Order Number DE89016592. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Computer Documentation Group at Los Alamos National Laboratory plays an important role in the monthly change control process by documenting network component changes in a publication called the ICN Change Bulletin. BULLETIN is a menu-driven utility used by programmers and computer documentation writers to create articles for the ICN Change Bulletin, which is published in both hardcopy (printed) and softcopy (electronic) forms. BULLETIN also provides information used by other change control software tools. This paper describes the BULLETIN utility and its evolution from a single-purpose authoring tool to a complex, multipurpose authoring and change control tool. 4 refs., 4 figs.

23218 (LA-UR–90-32) **Re-engineering the Los Alamos Common File System.** Christman, R.D.; Cook, D.P.; Mercier, C.W. Los Alamos National Lab., NM (USA). [1990]. 7p. Sponsored by U.S. DOE Management & Administration. DOE Contract W-7405-ENG-36. (CONF-9005105–1: 10. IEEE symposium on mass storage systems, Monterey, CA (USA), 7-10 May 1990). Order Number DE90007887. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Los Alamos National Laboratory's Common File System is being substantially upgraded so it will continue to meet the future data storage needs of the Laboratory and other sites. The nature of computing is changing with the advent of workstations, different work loads, and standard approaches to networking and operating systems. We reviewed the pros and cons of the Common File System and numerous existing and planned systems. Our conclusion was that the Common File System was a valuable resource with many strengths that should be preserved for the future. We have arrived at a set of recommendations for changes and additions that we feel will allow the Common File System to continue to meet data storage needs in both the short and long term. The recommendations for 1990–1992 support the transition to Unix on supercomputers and support high performance networking. The recommendations for 1992–1995 support the transition to a Unix type file system that provides a significant level of file location transparency. For 1995–2000 the recommendations are necessarily less precise but support the notion of standard security, transparent file systems and faster networking. 11 refs.

23219 (LA-UR–90-613) **Using digital halftones in desktop publishing.** Webb, G.W. Los Alamos National Lab., NM (USA). [1990]. 5p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract W-7405-ENG-36. (CONF-900532–3: 37. international technical communications conference, Santa Clara, CA (USA), 20-23 May 1990). Order Number DE90007491. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

I examine the use of black and white scanned digital input of continuous tone images (photographs and some types of artwork) in publications produced on personal computers and give basic information about scanner resolution, gray scales, halftones, and their relation to printer output quality. 1 ref., 8 figs.

23220 (M–285) **ISLE [Image and Signal Processing LISP Environment] reference manual.** Sherwood, R.J.; Searfus, R.M. Lawrence Livermore National Lab., CA (USA). Jan 1990. 97p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. Order Number DE90007858. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

ISLE is a rapid prototyping system for performing image and signal processing. It is designed to meet the needs of a person doing development of image and signal processing algorithms in a research environment. The image and signal processing modules in ISLE form a very capable package in themselves. They also provide a rich environment for quickly and easily integrating user-written software modules into the package. ISLE is well suited to applications in which there is a need to develop a processing algorithm in an interactive manner. It is straightforward to develop the algorithms, load it into ISLE, apply the algorithm to an image or signal, display the results, then modify the algorithm and repeat the develop-load-apply-display cycle. ISLE consists of a collection of image and signal processing modules integrated into a cohesive package through a standard command interpreter. ISLE developer elected to concentrate their effort on developing image and signal processing software rather than developing a command interpreter. A COMMON LISP interpreter was selected for the command interpreter because it already has the features desired in a command interpreter, it supports dynamic loading of modules for customization purposes, it supports run-time parameter and argument type checking, it is very well documented, and it is a commercially supported product. This manual is intended to be a reference manual for the ISLE functions The functions are grouped into a number of categories and briefly discussed in the Function Summary chapter. The full descriptions of the functions and all their arguments are given in the Function Descriptions chapter. 6 refs.

23221 (PB–90-130253/XAB) **Supercomputers need super arithmetic. Final report.** Lozier, D.W.; Turner, P.R. National Inst. of Standards and Technology (NEL), Gaithersburg, MD (USA). Applied and Computational Mathematics Div. Oct 1989. 31p. (NISTIR–89/4135). Available from NTIS, PC A03/MF A01.

This paper discusses the parallel computation of vector norms and inner products in floating-point for vector and parallel computers. It concentrates on the vectorization of algorithms for the operations and proposes a new form of computer arithmetic, the symmetric level-index system.

23222 (PB–90-131228/XAB) **High-performance computing and networking for science. Background paper.** Office of Technology Assessment (U.S. Congress), Washington, DC (USA). Sep

1989. 52p. (OTA-BP-CIT–59). Available from NTIS, PC A04/MF A01.

Also available from Supt. of Docs.; Library of Congress catalog card No. 89-600758.

The background paper explores key issues concerning the Federal role in supporting national high-performance computing facilities and in developing a national research and education network.

23223 (PB–90-856337/XAB) **Supercomputers. December 1985-January 1988 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for December 1985-January 1988.** National Technical Information Service, Springfield, VA (USA). Jan 1990. 231p. Available from NTISPC N01/MF N01.

23227 (SAND–89-1482) **A scheme for running batch jobs interactively from menu-driven INGRES programs.** Vopicka, D.A. Sandia National Labs., Albuquerque, NM (USA). Feb 1990. 22p. Sponsored by U.S. DOE Management & Administration. DOE Contract AC04-76DP00789. Order Number DE90008134. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report presents a method of running batch jobs from menu-driven interactive EQUEL programs. EQUEL is the embedded query language of INGRES, a popular database management system used widely at Sandia. The method is framed in the VAX/VMS operating system environment.

23228 (SAND–89-2670C) **On the classification of ideal secret sharing schemes.** Brickell, E.F.; Davenport, D.M. Sandia National Labs., Albuquerque, NM (USA). 2 Nov 1989. 10p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8908215–1: Crypto '89, Santa Barbara, CA (USA), 12 Aug 1989). Order Number DE90008739. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

In a secret sharing scheme, a dealer has a secret key. There is a finite set P of participants and a set Γ of subsets of P. A secret sharing scheme with Γ as the access structure is a method which the dealer can use to distribute shares to each participant so that a subset of participants can determine the key if and only if that subset is in Γ. The share of a participant is the information sent by the dealer in private to the participant. A secret sharing scheme is ideal if any subset of participants who can use their shares to determine any information about the key can in fact actually determine the key, and if the set of possible shares is the same as the set of possible keys. In this paper, we show a relationship between ideal secret sharing schemes and matroids. 9 refs.

23229 (SAND–90-0052C) **RIPE: An object-oriented Robot Independent Programming Environment.** Miller, D.J.; Lennox, R.C. Sandia National Labs., Albuquerque, NM (USA). [1990]. 10p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-9004148–1: USENIX C++ conference, San Francisco, CA (USA), 9-11 Apr 1990). Order Number DE90008501. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

An object-oriented Robot Independent Programming Environment (RIPE) developed at Sandia National Laboratories is being used for rapid design and implementation of a variety of applications. A system architecture based on hierarchies of distributed multiprocessors provides the computing platform for a layered programming structure that models the application as a set of software objects. These objects are designed to support model-based automated planning and programming, real-time sensor-based activity, error handling, and robust communication. The object-oriented paradigm provides mechanisms such as inheritance and polymorphism which allow the implementation of the system to satisfy the goals of software, reusability, extensibility, reliability, and portability. By designing a hierarchy of generic parent classes and device-specific subclasses which inherit the same interface, a Robot Independent Programming Language (RIPL) is realized. Work cell tasks demonstrating robotic cask handling operations for nuclear waste facilities are successfully implemented using this object-oriented software environment. 19 refs., 8 figs.

23230 (UCRL–21276) **POSTER user's manual: Version May 1989.** Ludeking, L. (Mission Research Corp., Newington, VA (USA)); Warren, G.; McDonald, J.; Goplen, B. Lawrence Livermore National Lab., CA (USA); Mission Research Corp., Newington, VA (USA). May 1989. 133p. Sponsored by U.S. Department of Defense. DOE Contract W-7405-ENG-48. (MRC/WDC-R–166). Order Number DE90008789. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

The purpose of this document is to describe the procedures for using the POSTER post processor. This report will discuss the capabilities of POSTER, describe the command structure, and provide examples of the input and output options available. 1 ref., 5 figs., 4 tabs.

23231 (UCRL–101868) **An information-theoretic look at branch-prediction.** Ponder, C.G. (Lawrence Livermore National Lab., CA (USA)); Shebanow, M.C. Lawrence Livermore National Lab., CA (USA). 13 Sep 1989. 26p. Sponsored by University of

California; U.S. Department of Defense; U.S. DOE Energy Research; National Science Foundation; State of California. DOE Contract W-7405-ENG-48. CCR-8812843;DAAG29-85-K-0070;N00039-84-C-0089. (CONF-900564–1: Association for Computing Machines (ACM) sigmetrics '90 conference, Boulder, CO (USA), 22-25 May 1990). Order Number DE90001170. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Accurate branch-prediction is necessary to utilize deeply pipelined and Very Long Instruction-Word (VLIW) architectures. For a set of program traces we show the upper limits on branch predictability, and hence machine utilization, for important classes of branch-predictors using static (compiletime) and dynamic (runtime) program information. A set of optimal "superpredictors" is derived from these program traces. These optimal predictors compare favorably with other proposed methods of branch-prediction. 11 refs., 5 figs., 11 tabs.

23232 (UCRL–102046) **Recent advances in 3D finite difference mesh generation using the BRL-CAD package.** Laguna, G.W. Lawrence Livermore National Lab., CA (USA). Sep 1989. 16p. Sponsored by U.S. Department of Defense; U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Contract AFWL87-217. (CONF-8910366–1: BRL-CAD symposium '89, Aberdeen, MD (USA), 24-25 Oct 1989). Order Number DE90007854. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

For the past three years Lawrence Livermore National Laboratory has been developing methods for generating 3D finite difference (FD) meshes directly from solid models. During the past year we have changed our solid modeling platform for FD mesh generation from the TIPS-1 solid modeler to the BRL-CAD package. In addition to the basic changes required by the differences between these two modelers and their application interfaces, we have also developed a new strategy for generating the mesh from the sample data. This new approach has dramatically improved the correspondence between generated meshes and the originating geometries. Our new approach also generates mesh elements which are more appropriate for our FD analysis code, TSAR, which calculates edge-based vector unknowns. In the past, edge (wire) mesh elements were approximated from mesh cells, however, we are now able to generate true edge mesh elements in a direct and straightforward manner. The basis of this new approach is a two step process of sampling and filtering which require that each FD mesh cell be subdivided into eight equal-sized octants. By using octants, the mesh generator can sense the configuration of the geometry contained by a cell and assign only those mesh elements which are appropriate to the given configuration. In addition to the above changes, several new features and capabilities have been added which together form a very flexible tool for generating FD meshes. Our mesh generator is currently undergoing internal testing further development. Nonetheless, it has already been used to generate meshes for several projects at LLNL, and users of these meshes have obtained acceptable results. 4 refs., 9 figs.

23233 (UCRL–102663) **The Livermore distributed storage system: Implementation and experiences.** Foglesong, J.; Richmond, G.; Cassell, L.; Hogan, C.; Kordas, J.; Nemanic, M. Lawrence Livermore National Lab., CA (USA). Jan 1990. 10p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-9005105–4: 10. IEEE symposium on mass storage systems, Monterey, CA (USA), 7-10 May 1990). Order Number DE90007257. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The LINCS Storage System (LSS) has been in production at Lawrence Livermore National Laboratory since January, 1988. In the development of the LSS, the designers made key architectural decisions which included the separation of data and control messages, a network-wide locking mechanism, and the separation of the naming mechanism from other object managers. Other important issues of the system deal with space management, descriptor management, and system administration. This paper outlines the LSS software system and then focuses on these key design decisions and issues with the intent of providing some insight into the types of difficulties designers face in developing a distributed storage system. 11 refs., 3 figs.

23234 (UCRL–102664) **The Livermore Distributed Storage System: Requirements and overview.** Hogan, C.; Cassell, L.; Foglesong, J.; Kordas, J.; Nemanic, M.; Richmond, G. Lawrence Livermore National Lab., CA (USA). Jan 1990. 15p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-9005105–2: 10. IEEE symposium on mass storage systems, Monterey, CA (USA), 7-10 May 1990). Order Number DE90007255. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This paper outlines the requirements for a large-scale, distributed storage system, and describes how a system being developed at the Lawrence Livermore National Laboratory, called the LINCS Storage System (LSS), meets those requirements. The LSS provides distributed storage in an environment that includes supercomputer host machines and a large-capacity, hierarchical central repository. The paper defines the key turns and concepts of the LSS and gives a brief architectural overview of the system. Major system components are described in more detail. The contributions of the LSS to the design of large-scale, distributed storage systems are identified and discussed throughout the paper. Finally, the current status of the development of the LSS is described, including a brief summary of hardware and software components. 18 refs., 8 figs.

23235 (UCRL–102665) **Overcoming Unix kernel deficiencies in a portable, distributed storage system.** Gary, M. Lawrence Livermore National Lab., CA (USA). Jan 1990. 7p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-9005105–3: 10. IEEE symposium on mass storage systems, Monterey, CA (USA), 7-10 May 1990). Order Number DE90007256. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The LINCS Storage System at Lawrence Livermore National Laboratory was designed to provide an efficient, portable, distributed file and directory system capable of running on a variety of hardware platforms, consistent with the IEEE Mass Storage System Reference Model. Our intent was to meet these requirements with a storage system running atop standard, unmodified versions of the Unix operating system. Most of the system components runs as ordinary user processes. However, for those components that were implemented in the kernel to improve performances, Unix presented a number of hurdles. These included the lack of a lightweight tasking facility in the kernel; process-blocked I/O; inefficient data transfer; and the lack of optimized drivers for storage devices. How we overcame these difficulties is the subject of this paper. Ideally, future evolution of Unix by vendors will provide the missing facilities; until then, however, data centers adopting Unix operating systems for large-scale distributed computing will have to provide similar solutions. 11 refs., 5 figs.

23236 **The epsilon dataflow processor.** Grafe, V.G. (Sandia National Labs., Albuquerque, NM (USA)); Davidson, G.S.; Hoch, J.E.; Holmes, V.P. pp. 428 of Proceedings of the 16th annual international symposium on computer architecture. Association for Computing Machinery, New York, NY (1989). DOE Contract AC04-76DP00789. (CONF-890537–: 16. annual international symposium on computer architecture, Jerusalem (Israel), 28 May - 1 jun 1989).

The epsilon dataflow architecture is reported in this paper. It is designed for high speed uniprocessor execution as well as for parallel operation in a multiprocessor system. The epsilon architecture directly matches ready operands, thus eliminating the need for associative matching stores. epsilon also supports low cost data fan out and critical sections. A 10 MFLOPS CMOS/TTL processor prototype is running and its performance has been measured with several benchmarks. The prototype processor has demonstrated sustained performance exceeding that of comparable control flow processors running at higher clock rates.

23237 **Implementation of a 3D thermal analysis code on the CM-2 connection machine computer.** Cline, R.E. Jr. (Sandia National Labs., Livermore, CA (US)); Boghosian, B.M.; Nemnich, B. pp. 737 of Proceedings of the 2nd symposium on the frontiers of massively parallel computation. IEEE Service Center, Piscataway, NJ (1988). (CONF-8810385–: 2. symposium on the frontiers of massively parallel computation, Fairfax, VA (USA), 10-12 Oct 1988).

This paper describes progress toward the full implementation of a version of TACO3D, a 3D thermal analysis code, for use on the CM-2 connection machine. The authors have implemented a combination of a parallel conjugate gradient solver, which runs on the CM-2, and a serial calling program, which resides on the VAX front-end in order to assess the feasibility of utilizing this type of massively parallel computer in the engineering production environment. Preliminary results show this implementation, running on a 16K processor CM-2, is over 5 times faster than a single XMP processor in the solution of a – 30,000 node 3D application. The authors discuss future plans to complete the optimum implementation of the entire code.

23238 **A parallel particle-in-cell model for the massively parallel processor.** Lin, C.S. (Southwest Research Inst., San Antonio, TX (USA)); Thring, A.L.; Koga, J. pp. 737 of Proceedings of the 2nd symposium on the frontiers of massively parallel computation. IEEE Service Center, Piscataway, NJ (1988). (CONF-8810385–: 2. symposium on the frontiers of massively parallel computation, Fairfax, VA (USA), 10-12 Oct 1988).

The particle-in-cell model, which has been used extensively on supercomputers to simulate fusion and space plasma phenomena, is difficult to develop for the massively parallel processor (MPP) because the model requires indirect indexing in computing electric fields. To overcome the difficulties, a parallel PIC algorithm is developed for MPP by mapping particles in a cell randomly to a row of processors. Because of this mapping, the algorithm needs only the nearest neighbor communication to sort particles and to collect charge density for each cell. From the cell charge density, this algorithm then calculates electric fields at the cell by fast Fourier transform. The developed PIC code has a speed comparable to that of the vectorized PIC code on Cray X-MP. The results from simulating the plasma instabilities of a cold electron beam in a hot electron background are presented.

23239 **Pipelined data parallel algorithms: Concept and modeling. .** TaKing, C. (Michigan State Univ., East Lansing, MI (USA). Dept. of Computer Science); Chou, W.H.; Wi, L.M. pp. 687 of 1988 international conference on supercomputing. Association for Computing Machinery, New York, NY (1988). DOE Contract W-31-109-ENG-38. (CONF-8807116–: International conference on supercomputing, Saint-Malo (France), 4-8 Jul 1988).

A new style of efficient parallel algorithms on distributed-memory multiprocessors is introduced, which exploits parallelism through pipelined parallel computation, or large-grain pipelining. To model pipelined parallel computations, an analytic model is presented, which takes into account both underlying architecture and algorithm behavior. The authors' assert that the resultant model is accurate enough to predict the performance of a given algorithm, and to assist in algorithm designs for determining optimal design parameters such as the granularity. Results from experiments performed on a 64-node NCUBE multiprocessor fare discussed, and a systematic procedure for designing pipelined data parallel algorithms from nested loop programs is described. The impact of the second generation distributed memory multiprocessors on the pipelined parallel computations is also discussed.

23240 **On data synchronization for multiprocessors.** Su, H.M. (Illinois Univ., Urbana, IL (USA). Center for Supercomputing Research and Development); Yew, P.C. pp. 428 of Proceedings of the 16th annual international symposium on computer architecture. Association for Computing Machinery, New York, NY (1989). (CONF-890537–: 16. annual international symposium on computer architecture, Jerusalem (Israel), 28 May - 1 jun 1989).

As the grain size becomes smaller, more parallelism can be found in most programs. However, to exploit smaller grain parallelism, more efficient synchronization primitives are needed to reduce the increased synchronization overhead. The granularity of parallelism that can be exploited on a multiprocessor system depends heavily on the type and the efficiency of the synchronization supported by the system. For medium-grain parallelism, ordered dependences such as data dependences and control dependences need to be enforced in order to guarantee the correctness of the parallel execution. Hence, data synchronization is one of the major sources of synchronization overhead in the program execution. In this paper, the authors classify the synchronization schemes based on how synchronization variables are used. A scheme, the process-oriented scheme, is proposed. It requires a very small number of synchronization variables and can be supported efficiently by simple hardware in the system.

23241 **Simulation and analysis of enhanced switch architectures for interconnection networks in massively parallel shared memory machines.** Liu, Y.S. (Ultracomputer Research Lab., Courant Institute of Mathematical Sciences, New York Univ., NY (US)); Dickey, S. pp. 737 of Proceedings of the 2nd symposium on the frontiers of massively parallel computation. IEEE Service Center, Piscataway, NJ (1988). (CONF-8810385–: 2. symposium on the frontiers of massively parallel computation, Fairfax, VA (USA), 10-12 Oct 1988).

Differences in switch architecture can have a significant effect on both latency and throughout in interconnection networks. The authors assess improvements in performance which can be obtained by adding buffers to a crossbar switch, by changing the configuration of the buffers, and by adding the capability of combining messages to the buffers. Four basic k x k crossbar switch types are described: unbuffered, k-input buffers, one per output port; one-input buffers, one per input port; and one-input buffers, k buffers per output port. The authors review previous analytical work and simulation studies of some of these switch types and extend the analysis to the other types. An analytical model for simple hot spot traffic is presented and simulation results are shown for different kinds of message combining.

23242 **Regular processor arrays.** Malony, A.D. (Illinois Univ., Urbana, IL (USA). Center for Supercomputing Research and Development). pp. 737 of Proceedings of the 2nd symposium on the frontiers of massively parallel computation. IEEE Service Center, Piscataway, NJ (1988). (CONF-8810385–: 2. symposium on the frontiers of massively parallel computation, Fairfax, VA (USA), 10-12 Oct 1988).

Regular is a term used to suggest simple and uniform structure of a parallel processor's organization or a parallel algorithms's operation. In this paper, the authors define regularity for processor array structures in two dimensions and enumerate the eleven distinct regular topologies. Space and time emulation schemes among the regular processor arrays are constructed to compare their geometric and performance characteristics. The hexagonal array is shown to have the most efficient emulation capabilities.

23243 **Dense symmetric networks from linear groups.** Campbell, L. (Computer Science Dept., Univ. of Idaho (US)); Fellows, M.; Carlsson, G.; Faber, V.; Moore, J.; Langston, M.; Mullhaupt, A. pp. 737 of Proceedings of the 2nd symposium on the frontiers of massively parallel computation. IEEE Service Center, Piscataway, NJ (1988). (CONF-8810385–: 2. symposium on the frontiers of massively parallel computation, Fairfax, VA (USA), 10-12 Oct 1988).

An algebraic approach to the problem of constructing large networks of bounded degree and diameter is described. Subgroups of GL(2,n) are employed to provide a number of recordbreaking constructions in the range of potential engineering significance for massive networks. These constructions, all highly symmetric, can be viewed as belonging to a family of constructions based on vector spaces and their automorphism groups that include hypercubes and cube-connected cycles as special cases.

23244 **An evaluation of Cray-1 and Cray X-MP performance on vectorizable Livermore Fortran Kernels.** Tang, J. (Illinois Univ., Urbana, IL (USA). Center for Supercomputing Research and Development); Davidson, E.S. pp. 687 of 1988 international conference on supercomputing. Association for Computing Machinery, New York, NY (1988). (CONF-8807116–: International conference on supercomputing, Saint-Malo (France), 4-8 Jul 1988).

This paper studies the impact of the architecture features of the Cray-1 and the Cray X-MP and related compiler optimizations on machine performance. The authors develop a methodology for evaluating the effectiveness of the Cray Fortran compilers in coping with the architectural features and limitations of the Cray-1 and the Cray X-MP. As examples, the effects of vector register reservation and vector index misalignment on the performance of Livermore Fortran Kernels (LFKs) are presented. The causes of the performance differences of two Cray Fortran compilers,

CFT1.14 and CFT77.13, on the vectorized LFKs are described and some areas for further improvement are suggested.

23245 **An optimally portable SIMD programming language.** Tuck, R. (Computer Science Dept., Duke Univ. and Computer Science Dept., Univ. of North Carolina at Chapel Hill, NC (US)). pp. 737 of Proceedings of the 2nd symposium on the frontiers of massively parallel computation. IEEE Service Center, Piscataway, NJ (1988). (CONF-8810385--: 2. symposium on the frontiers of massively parallel computation, Fairfax, VA (USA), 10-12 Oct 1988).

Existing programming languages for SIMD (single-instruction multiple-data) parallel computers make implicit architectural assumptions. These limit each language to architectures satisfying its assumptions. This paper presents a theoretical foundation for developing much more portable languages for SIMD computers. It also describes work in progress on the design and implementation of such a language. An optimally portable programming language for a set of architectures is one which allows each program to specify the subset of those architectures on which it must be able to run, and which then allows the program to exploit exactly those architectural features available on all of the target architectures. The features available on an architecture are defined to be those the architecture can implement with a constant-bounded number of operations. This definition ensures reasonable execution efficiency, and identifies architectural differences which are relevant to algorithm selection. An optimally portable programming language for SIMD computers, called Porta-SIMD is being developed to demonstrate these ideas.

Contents include: statistical feature extraction; adaptive estimator of probability density functions; computationally efficient estimators of Bayes risk; structure preserving dimensionality reduction; oil-spill identification; and digital-image processing.

23247 (CONF-900532-4) **Translating training notebooks into Korean and Japanese.** Schmidt, B.J. (ed.). Argonne National Lab., IL (USA). [1990]. 4p. Sponsored by U.S. Department of Defense; U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From 37. international technical communications conference; Santa Clara, CA (USA); 20-23 May 1990. Order Number DE90007802. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This paper describes the translation of training notebooks into Korean and Japanese. The process of defining the project scope and developing specifications is discussed, and some of the more significant considerations and problems are identified. The discussion concludes with an evaluation of how the final product could have been improved.

23248 (CONF-8808222-1) **Economics of energy sources: Data management and information system.** Vaccaro, R.; Trozzi, C.; Sano, A. ENEA, Rome (Italy). Div. Documentazione e Informazione; TECHNE, Rome (Italy). Aug 1988. 7p. (In Italian). From 44. FID conference and congress; Helsinki (Finland); 28 Aug - 1 sep 1988. Order Number DE89761952. Available from NTIS (US Sales Only), PC A02/MF A01.

This work reports on an information system containing historical series in the field of economics of energy sources. Specific problems related to energy data are analyzed together with the general problem of data, information and information systems. In the development of an information system, before logical and physical design, it is essential that the system be analyzed from the point of view of conceptual and organizational design. Referring to ENERGECO, a data base in the fields of energy and economics, developed by Energy Studies Directorate of ENEA, the problem of interface of an information system is discussed. ENERGECO represents the first step in the development of a complete energy information system. In this work, the principal aspects for the planning of a such system are introduced; in particular the structure of energy data is analyzed. A "descriptive scheme", that defines the structure of data, is analyzed for every process (for example, production) and its relative indicators (for example, quantity) in all its elements (energy source, unit, coverage period, coverage area, etc.). Finally, the basis for a decision support system, that allows the user to retrieve data, to use rules for their combination and aggregation and also to use statistical functions and models are set.

23249 (CONF-8908212-1) **Analysis of compact 0-complete trees: A new access method to large databases.** Orlandic, R. (Univerzitet 'Veljko Vlahovic' u Titogradu, Titograd (Yugoslavia)); Pfaltz, J.L. Virginia Univ., Charlottesville, VA (USA). Dept. of Computer Science; Univerzitet 'Veljko Vlahovic' u Titogradu, Titograd (Yugoslavia). [1989]. 31p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-88ER25063. From 7. FCT conference; Szeged (Hungary); Aug 1989. Order Number DE90008394. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Computer representations often lack those "nice properties" which make proofs of correctness and thorough analysis possible. Compact 0-complete trees are among the rare exceptions. They maintain a strong tie with their conceptual counterpart, a special kind of binary trie, which mirrors their properties and behavior. The ability to shift the focus of analysis, as needed, between the conceptual trie structure and the actual representation enables a more flexible and more powerful set of analytical tools. We have used this paradigm in our investigation of compact 0-complete trees, and here we present some results of that research. In particular, we demonstrate correctness of some operations defined on the structure and derive the expected values of those parameters which are critical for the performance of the structure. 4 refs., 7 figs.

23250 (DOE/ER/25063-2) **Implementation of a hypercube database system: Annual report, March 1989-February 1990.** Pfaltz, J.L.; Son, S.H.; French, J.C. Virginia Univ., Charlottesville, VA (USA). Dept. of Computer Science. Feb 1990. 28p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-88ER25063. (UVA-527387/CS90/102). Order Number DE90008440. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This year, as we predicted in our grant renewal proposal, can be fairly called one of "implementation". A great many low-level modules that are needed for any database system, together with functional implementations of various syntactic constructs of ADAMS were coded and tested. Moreover, these were integrated into three basic system components: the language preprocessor, the persistent dictionary, and the run-time system, to create a complete working database system. Representative application programs using persistent ADAMS elements have been written and executed using the system. To be sure, not all of the components work as effectively as we would like. And we have not attained the level of parallelism that we had expected. Because of this we have embarked on a fundamental redesign of the run-time system and some of its component servers as are described in later sections. 25 refs.

23251 (EGG-10617-1066) **A model research archive: Archive and research implications for original records and support documents.** Fisher, W.A. EG and G Energy Measurements, Inc., Las Vegas, NV (USA). Dec 1989. 14p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC08-88NV10617. (CONF-891281-1: Scientific and technical information coordinating group meeting, Washington, DC (USA), 10 Dec 1989). Order Number DE90008246. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Office of Scientific and Technical Information (OSTI) and the National Technical Information Service (NTIS) maintain a well organized system to classify, store and retrieve reports of DOE funded research. However, there is no practicable automated system that fully addresses the storage, maintenance, and retrieval of information contained in the original research data from which the reports were generated. These data are the records that record the conditions and limits of research projects and the data derived from experiments and tests. They include field notebooks, commentary,

descriptions of instruments used, project officers reports and observations of the biota and the environment. These documents contain significant original research data, much of which cannot be reproduced in a laboratory and some, will never be attempted again. The data are priceless even in their present semi-organized state. However, depending upon the institution having custody, there is considerable danger that many of these records may be lost or deteriorate in time. Then, on increasing occasion, the researcher is often faced with an insurmountable volume of information. The very magnitude of the reports her or she must digest often results in a paucity of information in the midst of plenty. If specific information contained within these records can be preserved and made fully accessible to authorized researchers reflecting upon modern questions, the impact will have scientific, technology transfer, or commercial implications. The data, while priceless, will increase in value and be more likely to be preserved if they can be organized into an information retrievable format. 1 fig.

23252 (LBL–24578) **Physical design of temporal databases.** Gunadhi, H.; Segev, A. Lawrence Berkeley Lab., CA (USA). Jun 1988. 21p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE90008067. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The primary focus of research into temporal databases has been on logical data modeling. Yet, the feasibility of implementing such databases depends as much on the development of retrieval and storage structures that are suited to the unique nature of temporal data. In this paper, we discuss the major parameters that impact the physical design and distinguish temporal databases from conventional ones. This is followed by a proposal of structures to support the efficient processing common single-relation temporal queries. 19 refs., 3 figs., 4 tabs.

23253 (LBL–27359) **Currency-based updates to distributed materialized views.** Segev, A.; Fang, W. Lawrence Berkeley Lab., CA (USA). Jun 1989. 26p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-900214–2: 6. international conference on data engineering, Los Angeles, CA (USA), 5-9 Feb 1990). Order Number DE90007775. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In currency-based updates, processing a query to a materialized view has to satisfy a currency constraint which specifies the maximum time lag of the view data with respect to a transaction database. Currency-based update policies are more general than periodical, deferred, and immediate updates; they provide additional opportunities for optimization and allow updating a materialized view from other materialized views. In this paper, we present algorithms to determine the source and timing of view updates and validate the resulting cost savings through simulation results. 20 refs.

23254 (LBL–27873) **Categorizing sound for the establishment of source characteristics.** Meng, J.D. Lawrence Berkeley Lab., CA (USA). May 1989. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8910264–3: Asilomar conference on signals, systems and computers, Monterey, CA (USA), 31 Oct - 1 nov 1989). Order Number DE90007069. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

An appropriate categorization of orthogonal parameters of naturally produced (not electronically synthesized) sound based on correlations between producer characteristics and parameters of the received signal can speed the unambiguous identification of the sources of received sounds. Orthogonal parameters of the received signal are the frequency content of its carrier, the amplitude of its envelope and time dependent variations of both. Natural sound sources are objects or cavities or fluids stimulated by modulating devices or rotating devices, or by rapid changes in temperature or pressure. In this paper, we attempt to relate the modulating device and its transmitting operand to unique distinguishing characteristics of the resulting sounds, and to categorize received sound characteristics in a way which permits unambiguous identification of the source. 2 refs., 7 figs., 1 tab.

23255 (UCID–21679-Rev.1) **CALS [Computer-aided Acquisition and Logistic Support] Test Network information exchange user's manual: Revision 1.** Lawrence Livermore National Lab., CA (USA). 22 Dec 1989. 18p. Sponsored by U.S. Department of Defense. DOE Contract W-7405-ENG-48. (CTN–89-007). Order Number DE90008119. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The DoD Computer-aided Acquisition and Logistic Support (CALS) Test Network is conducting tests of the military standard for the Automated Interchange of Technical Information (MIL-STD-1840A) and its companion suite of military specifications. The CTN is a DoD-sponsored confederation of voluntary participants from industry and government, managed jointly by a technical staff at Air Force Logistics Command (AFLC) and Lawrence Livermore National Laboratory (LLNL). The objective of CTN tests is to demonstrate and evaluate the interchange and functional use of digital data information between industry and government using the CALS standards. The CTN Information Exchange (CTN Info-X) is a combination of information services for participants and sponsors of the work of the CALS Test Network. This manual tells how to access and use the CALS Info-X.

23256 (UCRL–100992) **A real-time parallel pipelined data-flow image-processing system.** Priatko, G.J.; Andersen, R.W. Lawrence Livermore National Lab., CA (USA). 1 May 1989. 7p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract W-7405-ENG-48. (CONF-891087–14: IEEE nuclear science symposium and exhibits, San Francisco, CA (USA), 25-27 Oct 1989). Order Number DE90008324. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Until recently, using real-time image processing has been limited because of the expense and complexity of the processing systems. In general, image processing requires both high processor and communications bandwidths. This is particularly true when designing a real-time system that must be capable of handling multiple simultaneous images. Recent developments in both digital technology and system architecture have resulted in the potential for creating low-cost high-performance systems. A common dilemma faced by system architects when designing a real-time image processing system is the need to balance performance against ease of implementation. Several strategies have evolved in an attempt to strike this balance. A common solution is to perform the computationally intensive tasks in special-purpose hardware and the higher-level tasks in software. In practice, this frequently results in a system that is limited by the bandwidth between the general-purpose hardware and the special- purpose hardware. This condition is often referred to as the I/O (input/output) bottleneck. In this paper we present a system that incorporates a highly modular task-specific hardware and software architecture. This architecture enables us to divide the tasks between high bandwidth processing elements and general-purpose workstations. An I/O bottleneck is avoided by including both high-and low-level processing elements and multiple high bandwidth buses within the image processor. This architecture produces a system that enables us to perform most of the imaging tasks within the image processor. In addition, our architecture provides efficient task partitioning. By separating the processing, display, and user interface functions, we can use different hardware and software platforms in different sections of the system. This enhances our ability to optimize, maintain, and upgrade the overall system. 2 figs.

23257 (UCRL–102827) **Toward the virtual classroom.** Pihlman, M.; Dirks, D.H. Lawrence Livermore National Lab., CA (USA). 3 Jan 1990. 14p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-900297–1: 1990 American Society for Engineering education conference, Lake Buena Vista, FL (USA), 5-9 Feb 1990). Order Number DE90008304. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Lawrence Livermore National Laboratory (LLNL) encourages its employees to remotely attend classes given by Stanford University, University of California at Davis, and the National Technological University (NTU). To improve the quality of education for LLNL employees, we are cooperating with Stanford University in upgrading the Stanford Instructional Television Network (SITN). A dedicated high-speed communication link (TI) between Stanford and LLNL will be used for enhanced services such as videoconferencing, real time classnotes distribution, and electronic distribution

of homework assignments. The new network will also allow students to take classes from their offices with the ability to ask the professor questions via an automatically dialed telephone call. As part of this upgrade, we have also proposed a new videoconferencing based classroom environment where students taking remote classes would feel as though they are attending the live class. All paperwork would be available in near real time and students may converse normally with, and see, other remote students as though they were all in the same physical location. We call this the "Virtual Classroom." 1 ref., 6 figs.

Corporate Author Index

This index lists the corporate authors responsible for issuing the documents in this publication which are identified primarily by report number. The corporate names are entered in standardized forms as defined in *DOE Energy Data Base: Corporate Author Entries* (DOE/TIC-4585). Each entry under a corporate name includes the document title and citation number. Three items of information may appear in parentheses: (1) an abbreviation to identify the document type, such as a report; (2) the country of publication, also abbreviated; and (3) the language of the document if non-English (R;US;In French). Author affiliations are not listed in this index.

Water supply constraints to energy development, phase 7: Summary report, 15:22589 (R;CA)

Acurex Corp., Research Triangle Park, NC (USA). Environmental Systems Div.
Structural changes during the decomposition of calcium hydroxide. Report for October 1988-July 1989, 15:22528 (R;US)

Aeronautical Research Labs., Melbourne (Australia)
Development of a T53-l11 engine computer model. Propulsion technical memo, 15:22077 (R;AU)

Aerospace Corp., El Segundo, CA (USA). Laboratory Operations
Studies of the structure and properties of amorphous a-Ar76Fe24Hx, 15:22136 (R;US)

Aerospace Corp., El Segundo, CA (USA). Space Sciences Lab.
Solar-cycle effects on trapped energetic particles. Technical report, 15:22806 (R;US)

Agassis North Associates, Winnipeg, MB (Canada)
Evolution of limnological conditions in lakes of the Nelson and Rat-Burntwood river systems after Churchill River diversion and Lake Winnipeg regulation: 1. An overview, 15:21601 (R;CA)

Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA)
Health assessment for Barceloneta Landfill, Florida Afuefra, Puerto Rico, Region 2. CERCLIS No. PRD98059129. Preliminary report, 15:22688 (R;US)
Health assessment for Beachwood Borough and Berkeley Township National Priorities List (NPL) Site, Ocean County, New Jersey, Region 2. CERCLIS No. NJD980654123. Final report, 15:22618 (R;US)
Health assessment for Bog Creek Farm Site (BCFS) National Priorities List (NPL) site, Howell Township, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD063157150. Final report, 15:22619 (R;US)
Health assessment for Burnt Fly Bog National Priorities List Site, Marlboro, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD980504997. Final report, 15:22620 (R;US)
Health assessment for Caldwell Trucking Company, Fairfield, New Jersey, Region 2. CERCLIS No. NJD048798953. Preliminary report, 15:22554 (R;US)
Health assessment for Chemical Control Corporation, Elizabeth, New Jersey, Region 2. CERCLIS No. NJD000607481. Final report, 15:22621 (R;US)
Health assessment for Chemical Leaman Tank Lines, Inc. (CLTL) NPL (National Oriorities List) site, Logan Township, Gloucester County, New Jersey, Region 2. CERCLIS No. NJD047321443. Final report, 15:22622 (R;US)
Health assessment for Chemsol Inc., Piscataway, Middlesex County, New Jersey, Region 2. CERCLIS No. NJD980528889. Preliminary report, 15:22623 (R;US)
Health assessment for Ciba-Geigy National Priorities List (NPL) site, Dover Township, Ocean County, New Jersey, Region 2. CERCLIS No. NJD00150217. Final report, 15:22624 (R;US)
Health assessment for Combe Fill North Landfill, Mount Olive Township, New Jersey, Region 2. CERCLIS No. NJD980530596. Final report, 15:22625 (R;US)
Health assessment for Combe Fill South Landfill, Morris County, New Jersey, Region 2. CERCLIS No. NJD094966611. Final report, 15:22626 (R;US)
Health assessment for Cosden Chemical Coatings NPL (National Priorities List) site, Beverly, New Jersey, Region 2. CERCLIS No. NJD000565531. Preliminary report, 15:22555 (R;US)
Health assessment for CPS/Madison Industries, Old Bridge Township, Middlesex County, New Jersey, Region 2. CERCLIS No. NJD002141190. Preliminary report, 15:22627 (R;US)
Health assessment for Curcio Scrap Metal Yard, Saddle Brook Township, Bergen County, New Jersey, Region 2. CERCLIS No. NJD011717584. Preliminary report, 15:22628 (R;US)
Health assessment for D'Imperio Property Site, Hamilton Township, New Jersey, Region 2. CERCLIS No. NJD980529416. Final report, 15:22629 (R;US)
Health assessment for Derewal Chemical Company National Priorities List (NPL) site, Kingwood Township, Hunterdon County, New Jersey, Region 2. CERCLIS No. NJD980761373. Preliminary report, 15:22630 (R;US)
Health assessment for Diamond Alkali/80 Lister Avenue, Newark, New Jersey, Region 2. CERCLIS No. NJD980528996. Final report, 15:22631 (R;US)
Health assessment for Evor Phillips Leasing, Old Bridge Township, Middlesex County, New Jersey, Region 2. CERCLIS No. NJD980654222. Preliminary report, 15:22632 (R;US)
Health assessment for Fairlawn Wellfield, Fairlawn, New Jersey, Region 2. CERCLIS No. NJD980654107. Preliminary report, 15:22633 (R;US)
Health assessment for Fibers Public Supply Wells, Guayama, Puerto Rico, Region 2. CERCLIS No. PRD980763783. Preliminary report, 15:22574 (R;US)
Health assessment for Fort Dix Sanitary Landfill, Pemberton Township, New Jersey, Region 2. CERCLIS No. NJ2210020275. Preliminary report, 15:22634 (R;US)
Health assessment for Fulton Terminals Site, Fulton, New York, Region 2. CERCLIS No. NYD980593099. Final report, 15:22669 (R;US)
Health assessment for Ge-Moreau, South Glen Falls, New York, Region 2. CERCLIS No. NYD980052335. Final report, 15:22668 (R;US)
Health assessment for GEMS Landfill National Priorities List (NPL) site, Gloucester Township, Camden County, New Jersey, Region 2. CERCLIS No. NJD980529192. Final report, 15:21900 (R;US)
Health assessment for General Electric Wiring Devices, Juana Diaz, Puerto Rico, Region 2. CERCLIS No. PRD090282757. Final report, 15:22573 (R;US)

Health assessment for Goose Farm National Priorities List (NPL) site, Plumsted Township, Ocean County, New Jersey, Region 2. CERCLIS No. NJD980530109. Final report, 15:22635 (R;US)

Health assessment for Griffiss Air Force Base NPL (National Priorities List) site, Rome, Oneida County, New York, Region 2. CERCLIS No. NY4571924451. Final report, 15:22664 (R;US)

Health assessment for Haviland Complex National Priorities List (NPL) site, Hyde Park, New York, Region 2. CERCLIS No. NYD980785661. Final report, 15:22663 (R;US)

Health assessment for Hercules Inc., Gibbstown, Glocester County, New Jersey, Region 2. CERCLIS No. NJD002349058. Preliminary report, 15:22636 (R;US)

Health assessment for Horstmann's Dump, East Hanover, New Jersey, Region 2. CERCLIS No. NJD981084577. Preliminary report, 15:22556 (R;US)

Health assessment for Hudson River PCB (polychlorinated biphenyl) NPL (National Priorities List) site, State of New York, Region 2. CERCLIS No. NYD980763841. Final report, 15:22659 (R;US)

Health assessment for Hyde Park Landfill National Priorities List (NPL) site, Niagara Falls, New York, Region 2. CERCLIS No. NYD000831644. Final report, 15:22660 (R;US)

Health assessment for Islip Sanitary Landfill, Suffolk County, New York, Region 2. CERCLIS No. NYD980506901. Preliminary report, 15:22658 (R;US)

Health assessment for Jones Sanitation Landfill (Jones Septic Site), Hyde Park, Dutchess County, New York, Region 2. CERCLIS No. NYD980534556. Preliminary report, 15:22572 (R;US)

Health assessment for Juncos Landfill, Juncos, Puerto Rico, Region 2. CERCLIS No. PRD980512362. Final report, 15:22529 (R;US)

Health assessment for Kentucky Avenue Wellfield National Priorities List (NPL) site, Horseheads, Chemung County, New York, Region 2. CERCLIS No. NYD981560428. Final report, 15:22678 (R;US)

Health assessment for Kin-Buc Landfill, Edison Township, New Jersey, Region 2. CERCLIS No. NJD049860836. Final report, 15:22637 (R;US)

Health assessment for Lang Property National Priorities List (NPL) site, Pemberton Township, Burlington County, New Jersey, Region 2. CERCLIS No. NJD980505382. Final report, 15:22638 (R;US)

Health assessment for Lone Pine Landfill National Priorities List (NPL) site, Freehold, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD980505424. Final report, 15:22639 (R;US)

Health assessment for Ludlow Landfill National Priorities List (NPL) site, Clayville, Oneida County, New York, Region 2. CERCLIS No. NYD013468939. Final report, 15:22680 (R;US)

Health assessment for Mannheim Avenue Dump, Galloway Township, New Jersey, Region 2. CERCLIS No. NJD980654180. Preliminary report, 15:22641 (R;US)

Health assessment for Marathon Battery, Cold Springs, New York, Region 2. CERCLIS No. NYD001959757. Preliminary report, 15:22571 (R;US)

Health assessment for Matlack, Incorporated, Swedesboro, Gloucester County, New Jersey, Region 2. CERCLIS No. NJD043584101. Preliminary report, 15:22640 (R;US)

Health assessment for Monroe Township Landfill, Monroe, New Jersey, Region 2. CERCLIS No. NJD980505671. Preliminary report, 15:22642 (R;US)

Health assessment for Montgomery Township Housing Development, Montgomery, New Jersey, Region 2. CERCLIS No. NJD980654164. Final report, 15:22643 (R;US)

Health assessment for Myers Property, Franklin Township, New Jersey, Region 2. CERCLIS No. NJD980654198. Preliminary report, 15:22557 (R;US)

Health assessment for N.L. Industries, Inc., Pedricktown, New Jersey, Region 2. CERCLIS No. NJD061843249. Preliminary report, 15:22647 (R;US)

Health assessment for Nascolite Corporation, Millville, New Jersey, Region 2. CERCLIS No. NJD002362705. Final report, 15:22644 (R;US)

Health assessment for Naval Air Engineering Center, Lakehurst, Ocean County, New Jersey, Region 2. CERCLIS No. NJ7170023744. Preliminary report, 15:22645 (R;US)

Health assessment for Naval Weapons Station-Site A, Colts Neck, New Jersey, Region 2. CERCLIS No. NJ0170022172. Preliminary report, 15:22646 (R;US)

Health assessment for Olean Well Field National Priorities List (NPL) site, Olean Cattaraugus County, New York, Region 2. CERCLIS No. NYD980528657. Final report, 15:22685 (R;US)

Health assessment for Pijak Farm, Plumsted Township, New Jersey, Region 2. CERCLIS No. NJD980532808. Final report, 15:22558 (R;US)

Health assessment for PJP Landfill, Judson County, Jersey City, New Jersey, Region 2. CERCLIS No. NJD980505648. Preliminary report, 15:22648 (R;US)

Health assessment for RCA del Caribe, Inc., Barceloneta, Puerto Rico, Region 2. CERCLIS No. PRD090370537. Preliminary report, 15:22687 (R;US)

Health assessment for Reich Farm National Priorities List (NPL) site, Pleasant Plains, Ocean County, New Jersey, Region 2. CERCLIS No. NJD980529713. Final report, 15:22559 (R;US)

Health assessment for Renora Site, Edison Township (bonhantown), New Jersey, Region 2. CERCLIS No. NJD070415005. Final report, 15:22649 (R;US)

Health assessment for Ringwood Mines/Landfill National Priorities List (NPL) site, Ringwood, Passaic County, New Jersey, Region 2. CERCLIS No. NJD980529739. Final report, 15:22650 (R;US)

Health assessment for Rockaway Borough Well Field National Priorities List (NPL) site, Borough of Rockaway, Morris County, New Jersey, Region 2. CERCLIS No. NJD980654115. Final report, 15:22651 (R;US)

Health assessment for Rocky Hill Municipal Wellfield, Rocky Hill, New Jersey, Region 2. CERCLIS No. NJD980654156. Final report, 15:22652 (R;US)

Health assessment for Sayreville Landfill, Middlesex County, Sayreville, New Jersey, Region 2. CERCLIS No. NJD980505754. Preliminary report, 15:22653 (R;US)

Health assessment for Scientific Chemical Processing, Carlstadt, Bergen County, New Jersey, Region 2. CERCLIS No. NJD070565403. Preliminary report, 15:22560 (R;US)

Health assessment for Sharkey Landfill, Troy Hills, New Jersey, Region 2. CERCLIS No. NJD980505762. Final report, 15:22654 (R;US)

Health assessment for Shieldalloy Corporation, Newfield Borough, Gloucester County, New Jersey, Region 2. CERCLIS No. NJD002365930. Preliminary report, 15:22655 (R;US)

Health assessment for Spence Farm, Ocean County, Plumsted Township, New Jersey, Region 2. CERCLIS No. NJD980532816. Final report, 15:22561 (R;US)

Health assessment for Suffern Well Field NPL (National Priorities List) site, Village of Suffern, Rockland County, New York, Region 2. CERCLIS No. NYD980780878. Final report, 15:22694 (R;US)

Health assessment for Swope Oil Company, Pennsauken, Camden County, New Jersey, Region 2. CERCLIS No. NJD041743220. Final report, 15:22562 (R;US)

Health assessment for Tabernacle Drum Dump National Priorities List (NPL) site, Tabernacle Township, Burlington County, New Jersey, Region 2. CERCLIS No. NJD980761357. Final report, 15:22656 (R;US)

Health assessment for the Endicott Wellfield Site, Broome County, New York, Region 2. CERCLIS No. NYD980780746. Final report, 15:22675 (R;US)

Health assessment for Universal Oil Products National Priorities List (NPL) site, East Rutherford, New Jersey, Region 2. CERCLIS No. NJD002005106. Preliminary report, 15:22563 (R;US)

Health assessment for US Radium-West Orange, Orange, Essex County, New Jersey, Region 2. CERCLIS No. NJD980654172. Preliminary report, 15:21519 (R;US)

Health assessment for Vega Alta Public Supply Wells Site, Vega Alta, Puerto Rico, Region 2. CERCLIS No. PRS187147. Final report, 15:22686 (R;US)

Health assessment for Ventron/Velsicol, Wood-Ridge Borough, Bergen County, New Jersey, Region 2. CERCLIS No. NJD980529879. Preliminary report, 15:22564 (R;US)

Health assessment for Volney Landfill, Volney, New York, Region 2. CERCLIS No. NYD980509376. Final report, 15:22691 (R;US)

Health assessment for Waldick Aerospace Devices, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD054981337. Final report, 15:22565 (R;US)
Health assessment for Woodland Route 532 Dump, Woodland Township, Burlington County, New Jersey, Region 2. CERCLIS No. NJD980505887. Preliminary report, 15:22657 (R;US)
Health assessment for Woodlands Route 72 Dump, Woodland Township, Burlington County, New Jersey, Region 2. Cerclis No. NJD980505879. Preliminary report, 15:22617 (R;US)
Health assessment for York Oil Company, Moira, New York, Region 2. CERCLIS No. NYD000511733. Final report, 15:22689 (R;US)

Agency of Industrial Science and Technology, Tokyo (Japan)
Japan's Sunshine Project. 1988 Annual summary of comprehensive research, 15:21909 (R;JP;In Japanese)
Japan's Sunshine Project. 1988 Annual summary of comprehensive research, 15:21910 (R;JP)
Japan's Sunshine Project. 1988 Annual summary of coal liquefaction and gasification, 15:21118 (R;JP;In Japanese)
Japan's Sunshine Project. 1988 Annual summary of coal liquefaction and gasification, 15:21119 (R;JP)
Japan's Sunshine Project. 1988 Annual summary of solar energy R and D program, 15:21612 (R;JP;In Japanese)
Japan's Sunshine Project. 1988 Annual summary of solar energy R and D program, 15:21613 (R;JP)

Air Force Geophysics Lab., Hanscom AFB, MA (USA)
PROTEL: Design, fabrication, calibration, testing, and satellite integration of a proton telescope. Environmental research paper, 15:22421 (R;US)
Satellite observations of the O I 1304, 1356 and 1641 A dayglow and the abundance of atomic oxygen in the thermosphere, 15:22836 (R;US)

Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA)
Theoretical and experimental investigation of coupled Ar-ion lasers, 15:22317 (R;US)

Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering
Theory for graph-based language specification, analysis, and mapping with application to the development of parallel software. Doctoral thesis, 15:23207 (R;US)

Alabama Univ., Huntsville, AL (USA). Dept. of Mechanical Engineering
Resistive and eruptive instability by ponderomotive force with high-frequency plasma oscillations, 15:23064 (R;US)

Alberta Municipal Affairs, Edmonton, AB (Canada). Innovative Housing Grants Program
Caribbean export home, 15:21961 (R;CA)

ALPHATECH, Inc., Burlington, MA (USA)
Development of advanced WTA (Weapon Target Assignment) algorithms for parallel processing. Final report, 15:22484 (R;US)

Altex Technologies Corp., Santa Clara, CA (USA)
Development of a prototype pulse combustor sorbent treatment and injection SO_2 control technique: Quarterly technical progress report, October 1, 1989–December 31, 1989, 15:22290 (R;US)

Alzeta Corp., Santa Clara, CA (USA)
Basic research on radiant burners. Annual report, February 1988-January 1989, 15:21375 (R;US)

Amsterdam Univ. (Netherlands)
Atomic hydrogen in a magnetic trap, 15:22851 (R;NL)
Culturated rat cerebral cortex explants and their application in the study of SPECT scan radiopharaceuticals, 15:22460 (R;NL;In Dutch)
Energy distribution in dissociations of polyatomic molecules, 15:22852 (R;NL)
Nucleon multiplicities after pion absorption in ^{16}O, 15:22922 (R;NL)
The influence of fractionation and repair kinetics on radiation tolerance: Studies on rat lung and kidney, 15:22752 (R;NL)
Ventilation-perfused studies using SPECT: Quantitative assessment of regional pulmonary function, 15:22461 (R;NL)

AN SSSR, Moscow (USSR)
Observational physics of mirror world, 15:22813 (R;SU)

AN SSSR, Novosibirsk (USSR). Inst. Yadernoj Fiziki
ATsP8 analog-to-digital converter for potentiometric transducers, 15:22323 (R;SU;In Russian)
Information plate A32 of the KLUKVA data acquisition system, 15:22441 (R;SU;In Russian)
System for programmable microtreatment by a focused ion beam, 15:22394 (R;SU;In Russian)

AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Radioastronomicheskij Inst.
Destruction of quasiperiodic oscillations in weakly nonlinear oscillators, 15:22390 (R;SU;In Russian)
Gas dynamic theory of flight of fast electron flux in plasma, 15:23019 (R;SU;In Russian)
Jupiter's drifting decametric bursts with the changing time scale, 15:22810 (R;SU;In Russian)
Theory of a periodic cylindrical waveguide with a nonuniform metal-dielectric filling, 15:22368 (R;SU;In Russian)
Wind instability as a possible cause of the spiral structure formation in the gaseous subsystem of galaxies with the circular magnetic field, 15:22809 (R;SU;In Russian)

Analysis and Control of Energy Systems, Inc., Burlingame, CA (USA)
The performance potential of local and distributed load controllers: Final report, 15:21942 (R;US)

ANR Storage Co., Detroit, MI (USA)
Compressed-air energy storage: Pittsfield aquifer field test: Test data, Engineering analysis and evaluation: Final report, 15:21877 (R;US)

Architectural Energy Corp., Boulder, CO (USA)
The model electric restaurant: Volume 1, Restaurant subsystem analysis and evaluation: Final report, 15:22046 (R;US)

Argonne National Lab., IL (USA)
A benchmark for investigating the radial dependence of C/E for control rod worths in large decoupled cores, 15:21732 (R;US)
Comparison of the layer structure of vapor phase and leached SRL glass by use of AEM [analytical electron microscopy], 15:21461 (R;US)
Corrosion assessment in FBC [fluidized-bed combustion] systems, 15:21165 (R;US)
Deformation processing of $YBa_2Cu_3O_x$, 15:22140 (R;US)
Environmentally assisted cracking in light water reactors: Semiannual report, April 1988–September 1988: Volume 7, 15:21839 (R;US)
Evaluation of industrial magnetic heat pump/refrigerator concepts that utilize superconducting magnets, 15:22040 (R;US)
Feasibility study for management of the bulk wastes at the Weldon Spring quarry, Weldon Spring, Missouri, 15:21473 (R;US)
First level trigger processor for the ZEUS calorimeter, 15:22422 (R;US)
Hedonic price theory: Concept and applications, 15:21463 (R;US)
Initial use of the positive-ion injector of ATLAS, 15:22380 (R;US)
ITER [International Thermonuclear Experimental Reactor] R and D breeder blanket materials, 15:23107 (R;US)
PC-DYMAC: Personal Computer—DYnamic Materials ACcounting, 15:21548 (R;US)
Physical sputtering of metallic systems by charged-particle impact, 15:22104 (R;US)
Proposed plan for the management of bulk wastes at the Weldon Spring quarry, Weldon Spring, Missouri, 15:21474 (R;US)
Recommended documentation for computer users at ANL: Revision 2, 15:23208 (R;US)
The reaction of synthetic nuclear waste glass in steam and hydrothermal solution, 15:21460 (R;US)
The use of additives for reducing hydrogen yield in mortar containing slag and chloride salts, 15:21462 (R;US)
TMI-2 EPICOR-II Resin/Liner Investigation: Low-level waste data base development program for fiscal year 1989: Annual report, 15:21841 (R;US)
Toughened $YBa_2Cu_3O_x/ZrO_2$ composites, 15:22139 (R;US)
Translating training notebooks into Korean and Japanese, 15:23247 (R;US)
Tribological properties of boric acid and boric acid forming surfaces: Part 1, Crystal chemistry and self-lubricating mechanism of boric acid, 15:22169 (R;US)
Tribological properties of boric acid and boric-acid-forming surfaces: Part 2, Formation and self-lubrication mechanisms of

boric acid films on boron- and boric-oxide-containing surfaces, 15:22170 (R;US)
Using formal methods to develop a paradigm for software design, 15:21733 (R;US)
Whole body counting of radon daughters, 15:22748 (R;US)

Argonne National Lab., IL (USA). Energy Systems Div.
A technical and economic evaluation of oxygen-enriched combustion in diesel engines using water-emulsified fuels, 15:22079 (R;US)

Argonne National Lab., IL (USA). Environmental Assessment and Information Sciences Div.
Penetration of gas delivery systems in the United States: A state-level data analysis, 15:21364 (R;US)

Arinc Research Corp., Annapolis, MD (USA)
GADSRAM user's manual: Version 2.0: Final report, 15:21658 (R;US)

Arizona State Univ., Tempe, AZ (USA)
The photovoltaic properties of an Al In As/InP heterojunctions grown by LPE method. Final technical report, 15:21617 (R;US)

Arizona Univ., Tucson, AZ (USA). Dept. of Mining and Geological Engineering
Permeability changes resulting from gas desorption. Final report, May 1988-June 1989, 15:21156 (R;US)

Arizona Univ., Tucson, AZ (USA). Dept. of Physics
Study of solar oscillations. Final report, 1 April 1980-31 March 1981, 15:22805 (R;US)

Arkansas Research Consultants, Inc., Fayetteville, AR (USA)
Radar imagery interpretation to assess the hydrocarbon potential of four sites in the Philippines: [Final report], 15:21202 (R;US)

Armed Forces Radiobiology Research Inst., Bethesda, MD (USA)
AFRRI (Armed Forces Radiobiology Research Institute) reports, July, August, September 1989. Technical report, 15:22741 (R;US)
Survival after total-body irradiation. 1. Effects of partial small bowel shielding, 15:22739 (R;US)

Army Aeromedical Research Lab., Fort Rucker, AL (USA)
Effect of ultraviolet radiation on the energy metabolism of the corneal epithelium of the rabbit. Final report, 15:22740 (R;US)

Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica
A high-beta tokamak equilibrium, 15:23047 (R;NL)
FOM-Rijnhuizen contributions to IAEA technical committee meeting on ECE and ECRH, seventh joint workshop on ECE and ECRH (EC-7), Hefei, P.R. China, 8-11 May 1989, 15:23146 (R;NL)
Impact of electron trapping on rf current drive in tokamaks, 15:23045 (R;NL)
Quasilinear and toroidal effects on current drive by electron cyclotron waves, 15:23046 (R;NL)

Association Euratom-CEA, Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee
A conceptual steady-state tokamak reactor with passive current generation, 15:22992 (R;FR)
A new protection system against high voltage vacuum breakdowns developed for the Tore Supra neutral beam injector prototype, 15:21735 (R;FR)
Dynamical systems in plasma theory, 15:22994 (R;FR)
Spatially resolved soft x-ray (1 - 33 nm) spectroscopy of tokamak plasmas, 15:22430 (R;FR)
Turbulence associated with the sawtooth internal disruption, 15:22995 (R;FR)
Variational calculation of electromagnetic instabilities in tokamaks, 15:22993 (R;FR)

Association Euratom-CEA, Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Recherches sur la Fusion Controlee
Study and development of different techniques for the generation, conversion, propagation, and radiation of high power microwaves for the electronic cyclotron frequency plasma heating, 15:22997 (R;FR;In French)

Astronautics Technology Center, Madison, WI (USA)
Evaluation of industrial magnetic heat pump/refrigerator concepts that utilize superconducting magnets, 15:22040 (R;US)

Atlantic Environmental Services, Inc., Colchester, CT (USA)
Cyanide in MGP (manufactured gas plant) wastes: Investigation of analytical methods. Topical report, January 1988-June 1989, 15:21577 (R;US)
Manufactured gas plants and the National Priorities List: A technical review. Topical report, August 1988-July 1989. Final report, 15:21597 (R;US)
Soil-gas investigations at MGP (manufactured gas plant) sites: An evaluation of alternative compounds. Topical report, January 1989-June 1989. Final report, 15:21596 (R;US)

Atlantic Tidal Power Programming Board (Canada)
Assessment of retiming tidal power from Bay of Fundy using compressed air energy storage, 15:21643 (R;CA)

Atomic Energy Control Board, Ottawa, ON (Canada). Advisory Committee on Nuclear Safety
Alternative electical energy systems: A comparison of the risks of occupational and public fatalities: Executive summary, 15:22780 (R;CA)

Atominstitut der Oesterreichischen Universitaeten, Vienna (Austria)
Design, development and construction of an X-ray total reflection module: Final report for the period 15 March 1986 - 11 March 1989, 15:22433 (R;XA)

B

B.C. Research, Vancouver, BC (Canada)
Chemicals and fermentable biomass via hydrotropic agent pretreatment, 15:21579 (R;CA)
Particulate emissions of a dual fuel caterpillar 3208 engine, 15:22084 (R;CA)

Babcock Energy Ltd., Crawley (UK)
Copper oxychloride as a fireside additive in coal-fired utility boilers: Final report, 15:21158 (R;US)

Bailey Controls Co., Wickliffe, OH (USA)
R&D plans for advanced computer and control technologies: Volume 2, Instrumentation and control systems: Final report, 15:21655 (R;US)

Barakat and Chamberlin, Inc., Oakland, CA (USA)
Efficient electricity use: Estimates of maximum energy savings: Final report, 15:21949 (R;US)

Battelle Columbus Div., OH (USA)
Copper oxychloride as a fireside additive in coal-fired utility boilers: Final report, 15:21158 (R;US)

Battelle Ocean Sciences, Duxbury, MA (USA)
Contaminant loading to Puget Sound from two marinas. Puget Sound estuary program. Final report, June 1988-October 1988, 15:22613 (R;US)

Bestek Micro Devices and Systems, Inc., Ottawa, ON (Canada)
User-configurable modular PV system with microprocessor controller: Phase 3 report, 15:21623 (R;CA)

Bonn Univ. (Germany, F.R.). Mathematisch-Naturwissenschaftliche Fakultaet
Construction and test of a gas system for the supply of a jet chamber, 15:22425 (R;DE;In German)
Position calibration of the drift chamber system of the Bonn SAPHIR experiments by means of real particles, 15:22424 (R;DE;In German)
The influence of saturation effects in the gas amplification on the pulse height distribution of minimum ionizing particles, 15:22426 (R;DE;In German)
The muon trigger of the SAPHIR shower detector, 15:22427 (R;DE;In German)
The scintillation counter system at the SAPHIR detector, 15:22423 (R;DE;In German)

Bonn Univ. (Germany, F.R.). Physikalisches Inst.
Construction and test of a gas system for the supply of a jet chamber, 15:22425 (R;DE;In German)
Position calibration of the drift chamber system of the Bonn SAPHIR experiments by means of real particles, 15:22424 (R;DE;In German)

The influence of saturation effects in the gas amplification on the pulse height distribution of minimum ionizing particles, 15:22426 (R;DE;In German)
The muon trigger of the SAPHIR shower detector, 15:22427 (R;DE;In German)
The scintillation counter system at the SAPHIR detector, 15:22423 (R;DE;In German)

Bonneville Power Administration, Portland, OR (USA)
1989 Pacific Northwest loads and resources study: Technical appendix, 15:21935 (R;US)
Draft 1990 Resource Program, 15:21606 (R;US)
Draft 1990 Resource Program technical report, 15:21934 (R;US)
Improved selection procedures for irrigation sprinklers, 15:22043 (R;US)
Research projects in residential technology, 15:21964 (R;US)

Booz, Allen and Hamilton, Inc., Bethesda, MD (USA). Transportation Consulting Div.
Assessment of US electric vehicle programs with ac powertrains: Final report, 15:22081 (R;US)

Boston Univ., MA (USA)
Meteoritic basalts. Final report, 1986-1989, 15:22823 (R;US)
The geometry of disorder: Report 1987–1990, 15:22961 (R;US)

BRI Systems, Inc., Glendale, AZ (USA)
The performance potential of local and distributed load controllers: Final report, 15:21942 (R;US)

Brigham Young Univ., Provo, UT (USA). Dept. of Chemistry
Identification of genotoxic components of the heavy ends of energy-related materials: Final report, May 1, 1986–April 30, 1989, 15:22203 (R;US)

British Columbia Hydro, Vancouver, BC (Canada)
A prospectus for the Kelly Lake Substation to Cheekye Substation second 500 kV transmission line, 15:21854 (R;CA)
Proposal for the Fraser Valley substation and Puget Sound power and light intertie study, 15:21853 (R;CA)
The Third Williston to Kelly Lake 500 kv transition line: Project rationale, 15:21855 (R;CA)

British Columbia Ministry of Energy, Mines and Petroleum Resources, Victoria, BC (Canada)
Hydrocarbon and by-product reserves in British Columbia, 1988, 15:21352 (R;CA)

British Columbia Ministry of Environment and Parks, Victoria, BC (Canada)
A test burn of chlorophenol contiminated wood wastes at Northwood pulp mill, Prince George, B.C. [British Columbia]: Summary report, 15:21592 (R;CA)

Brookhaven National Lab., Upton, NY (USA)
A perfluorocarbon tracer transport and dispersion experiment in the North Sea Ekofisk oil field, 15:21183 (R;US)
Cloud albedo and climate perturbations due to anthropogenic sulfate, 15:22495 (R;US)
Density limitation on focusing of ground state cold H^0 beams, 15:22846 (R;US)
District cooling technology characterization case study: Austin, Texas: Final report, 15:22071 (R;US)
Dual photon absorptiometry: Validation of mineral and fat measurements, 15:22722 (R;US)
Extended x-ray absorption fine structure analysis applied to composite materials, 15:22167 (R;US)
Is natural background or radiation from nuclear power plants leukemogenic?, 15:22745 (R;US)
Molecular organization and electrical properties of mixed Langmuir-Blodgett multilayer thin films of polypyrrole, 15:22166 (R;US)
Neutrons: The kinder, gentler probe of condensed matter, 15:22945 (R;US)
Polarized beams at the ZGS and the AGS, 15:22379 (R;US)
Present status of BNL polarized sources, 15:22378 (R;US)
Proceedings of the 1989 oil heat technology conference and workshop, 15:22041 (R;US)
Reactivity accidents: A reassessment of the design-basis events, 15:21788 (R;US)
Recent developments in the BNL intense polarized H^- source program, 15:22376 (R;US)
Seismic fragility of nuclear power plant components (Phase II): Volume 3, Switchgear, I and C panels (NSSS) and relays, 15:21837 (R;US)
Shelf Edge Exchange Processes-2: SEEP2-01, R/V ENDEAVOR cruise 172: Hydrographic data report, 15:22784 (R;US)
Shelf Edge Exchange Processes-2: Seep2-02, R/V CAPE HATTERAS cruise CH01-88: Hydrographic data report, 15:22785 (R;US)
Shelf Edge Exchange Processes-2: SEEP2-03, R/V ENDEAVOR cruise 178: Hydrographic data report, 15:22786 (R;US)
Status of the BNL cold atomic beam and its focusing magnets, 15:22375 (R;US)
Surface-plasmon enhanced nonlinear photoelectric emission from thin silver films, 15:22100 (R;US)
The BNL volume H^- ion source, 15:22377 (R;US)
The role of polarity on the stability of graphitic compounds, 15:22137 (R;US)

Brown Univ., Providence, RI (USA)
Interactions of molecules with surfaces: Progress report, February 1989–January 1, 1990, 15:22958 (R;US)

Brown Univ., Providence, RI (USA). Div. of Engineering
Tensile fracture toughness of ceramic materials: Effects of dynamic loading and elevated temperatures, 15:22142 (R;US)

Building Research Establishment, Watford (UK)
An energy-efficient refurbishment of electrically heated high-rise flats, 15:21962 (R;GB)

Bundesgesundheitsamt, Berlin (Germany, F.R.). Inst. fuer Strahlenhygiene
Transfer of Cs-137 from food into milk of breast-feeding women, 15:22743 (R;DE;In German)

Bundesministerium der Verteidigung, Bonn (Germany, F.R.)
Investigations into the suppression of the nonspecific defence system by ionising radiation, 15:22744 (R;DE;In German)

Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.)
Quality assurance in ceramic materials and components. High-resolution non-destructive testing especially of ceramic surfaces. Final report, 15:22282 (R;DE;In German)
Safety studies on the production of silicide fuel with low uranium enrichment in the framework of the AF programme, project no. 13. Final report, 15:21731 (R;DE;In German)
SBR jacket cutters. Final report, 15:21455 (R;DE;In German)

Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany, F.R.)
Evaluation of PWR transients with highest pressure increase for the ATWS case 'loss of main feedwater supply', 15:21787 (R;DE;In German)
Studies on the controllability of sampling concepts for ultrasonic testing of welds in nuclear engineering, 15:22279 (R;DE;In German)
Studies on the controllability of sampling concepts for ultrasonic testing of welds in nuclear engineering, 15:22280 (R;DE;In German)
Studies on the realism of radioecological models, 15:22541 (R;DE;In German)
Transfer of Cs-137 from food into milk of breast-feeding women, 15:22743 (R;DE;In German)

C

California Inst. of Tech., Pasadena, CA (USA). Div. of Chemistry and Chemical Engineering
Quantum dynamics of chemical reactions. Final report, 1 July 1981-30 June 1982, 15:22320 (R;US)

California State Senate Water Resources Committee, Sacramento, CA (USA)
Coal surface control for advanced fine coal flotation: Quarterly report No. 5, October 1, 1989–December 31, 1989, 15:21147 (R;US)

California Univ., Davis, CA (USA)
Status of surface processes in the LLNL zonally symmetric model, 15:22540 (R;US)

California Univ., Davis, CA (USA). Dept. of Land, Air, and Water Resources
Determination of the toxicity, water-quality interactions, and biomagnification of selenium in aquatic food chains. Technical report for 15 August 1987-14 August 1989 (Final), 15:22615 (R;US)

California Univ., Davis, CA (USA). Div. of Materials Science and Engineering
An investigation of the mechanisms of solid state powder reaction in the combustion synthesis and sintering of high temperature materials: Progress report, May 27, 1986–August 15, 1989, 15:22143 (R;US)

California Univ., Los Angeles, CA (USA)
Development of a numerical method for full solution of magnetohydrodynamic flows and application to fusion blankets, 15:22878 (D;US)
High-frequency instability of the sheath-plasma resonance, 15:23061 (R;US)

California Univ., San Diego, CA (USA)
Hybrid (optical/electronic) computing and digital optical computing. Final report, 1 September 1985-31 August 1988, 15:23203 (R;US)

California Univ., Santa Barbara, CA (USA). Dept. of Chemistry
Flexibility of the zeolite RHO framework in-situ x-ray and neutron powder structural characterizations of divalent cation-exchanged zeolite RHO, 15:22198 (R;US)

Cambrian Engineering Group Ltd., Mississauga, ON (Canada)
Fluidized-bed catalytic cracking (FFC) catalyst fabrication: Final report and appendix, 15:21302 (R;CA)

Canadian Council of Resource and Environment Ministers, Downsview, ON (Canada)
Operating and emission guidelines for municipal solid waste incinerators, 15:22072 (R;CA)

Canadian Energy Research Inst., Calgary, AB (Canada)
Canadian crude oil supply/demand balances, 15:21313 (R;CA)
Continental natural gas market: Canadian export capacity in the 90s, 15:21931 (R;CA)

Canadian Seabed Research Ltd., Halifax, NS (Canada)
Beaufort Sea Ice Scour Data Base (SCOURBASE), update to 1986, 15:22294 (R;CA)
Hydraulic testing of multiple siphon generator intakes, 15:21608 (R;CA)

CANVIRO Consultants, Waterloo, ON (Canada)
Development and demonstration of new process standards for upgraded biogas energy utilization of municipal digestion facilities in Canada: Interim report. Draft, 15:22073 (R;CA)
Evaluation of energy production potential of the Linden Lee Farms anaerobic digestion and electrical co-generation system: Final report, 15:22042 (R;CA)

Case Western Reserve Univ., Cleveland, OH (USA)
preparation of 110K (Bi, Pb)-Sr-Ca-Cu-O superconductor from glass precursor, 15:22181 (R;US)

Catholic Univ. of America, Washington, DC (USA)
Advanced instrumentation for local measurement of gas-solid suspension flows: Quarterly technical progress report No. 11, 15:21164 (R;US)

Catholic Univ. of America, Washington, DC (USA). Dept. of Mechanical Engineering
MHD (magnetohydrodynamic) slow shocks in coronal and interplanetary space. Final report, 1 June 1986-31 May 1989, 15:22804 (R;US)

CEA Centre d'Etudes de Bruyeres-le-Chatel, 91 (France)
Interaction of a beam of heavy ions with a CO_2 laser produced plasma. Fitting of an ionographic tube and simulation of the experiment, 15:22996 (R;FR;In French)

CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France)
Density and temperature diagnostics of a Ne-like germanium plasma created by laser, 15:22985 (R;FR)
High resolution soft X-Ray spectrometer with 5-picosecond time-resolution for laser-produced plasma diagnostics, 15:22986 (R;FR)
Stimulated Raman scattering and ion dynamics: the role of Langmuir wave non-linearities, 15:22984 (R;FR)

CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-lez-Durance (France)
^{60}Co accumulation by scenedesmus obliquus. Mechanism of uptake and relative contribution of radionuclide adsorption and absorption, 15:22746 (R;FR;In French)

CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Protection Sanitaire
Determination of radium 226 and 228 in water, 15:22200 (R;FR;In French)
Determination of the plutonium contamination level in biological samples by liquid scintillation, 15:22201 (R;FR;In French)

CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Inst. de Protection et de Surete Nucleaire
System study application to the safety analysis of the exhaust and the tritium systems of a fusion reactor, 15:23102 (R;FR)
System study methodology. Development and potential utilization for fusion, 15:23101 (R;FR)

CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Inst. de Recherche Technologique et de Developpement Industriel (IRDI)
Investigation of γ lithium aluminate as tritium breeding material for a fusion reactor blanket, 15:23103 (R;FR)

CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Fondamentale (IRF)
Barium atoms and N20 molecular agregates reaction, 15:22847 (R;FR;In French)
Chemiluminescence in the Ba(6s6p, $^1P_1$) + CO_2 and O_2 reactions, 15:22218 (R;FR;In French)
Ionization and ions pair formation in He(n^1P) thermal collisions in the Rydberg + molecules low states, 15:22848 (R;FR;In French)
Production of autoionizing di-excited states at high angular momentum in Barium collisions with Xenon, 15:22849 (R;FR;In French)
Transition to turbulence via spatiotemporal intermittency, 15:22975 (R;FR)

CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Technologique et de Developpement Industriel (IRDI)
Investigation of γ lithium aluminate as tritium breeding material for a fusion reactor blanket, 15:23103 (R;FR)
Preliminary study of a blanket handling device and evaluation of the feasibility of eliminating the spread of radioactive contamination, 15:23104 (R;FR)
The gaz chromatographic isotope separation system for the jet active gas handling plant, 15:22199 (R;FR)

CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service de Physique Nucleaire a Moyenne Energie
Electro and photoproduction of strangeness, 15:22881 (R;FR)

CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service de Physique Theorique
Conformal invariance self-avoiding walks in the plane or on a random surface, 15:22955 (R;FR)
From the harmonic oscillator to the A-D-E classification of conformal models, 15:22906 (R;FR)
Lattice models and conformal field theories, 15:22908 (R;FR)
Level one Kac-Moody characters and modular invariance, 15:22907 (R;FR)
The non-linear universe from 0.01 to 100 Mpc, 15:22807 (R;FR)
Two-dimensional fractal geometry, critical phenomena and conformal invariance, 15:22905 (R;FR)

Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.
AGR steel corrosion monitoring schemes: progress on off-site testing of coupon specimens to end of 1985: Pt. 1: Mild steel coupons, 15:22103 (R;GB)
An assessment of Raman spectroscopy to detect iodine deposited on thin oxide films formed on Type 316 stainless steel, 15:22202 (R;GB)
Creep rupture properties of oxidised 20%Cr austenitic stainless steels, 15:22102 (R;GB)
Derivation of decay heat benchmarks for U235 and Pu239 by a least squares fit to measured data, 15:21717 (R;GB)
Measurements of the radioactive inventory of the old effluent pipe line on the BNL site, 15:21740 (R;GB)

Skin carcinogenesis following uniform and non-uniform β irradiation, 15:22747 (R;GB)
The effect of oxidation on the integrity of bolted structures, 15:21706 (R;GB)
The role of specimen temperature difference in the elevated temperature pitting/transfer of PE16 and 20/25/Nb SS during impact wear, 15:22101 (R;GB)

Central Electricity Generating Board, Southampton (UK). Marchwood Engineering Labs.
Weld repair issues in thick section austenitic pipework, 15:21725 (R;GB)

Central Electricity Research Labs., Leatherhead (UK)
Ichthyoplankton entrainment at Wylfa power station, Anglesey and implications for a further siting proposal, 15:21705 (R;GB)
Modelling airborne dispersion of coarse particulate material, 15:22496 (R;GB)
Simple methods for predicting gas leakage flows through cracks, 15:21724 (R;GB)

Central Research Inst. of Electric Power Industry, Tokyo (Japan)
Behavior of NH_3 in coal derived gas (Part 1). Continuous ammonia analyzer for coal derived gas, 15:21121 (R;JP;In Japanese)
Characteristics of metal oxide surge arrester elements under water absorption, 15:21852 (R;JP;In Japanese)
Dependence of the breakdown strength on the lamella orientation at the semiconducting interface in improved XLPE power cables, 15:21863 (R;JP;In Japanese)
Developing the inter-fuel competition model - an analysis of the structural changes of energy demand-supply in Japan, 15:21178 (R;JP)
Development of instantaneous removal device for short-circuit fault in low voltage distribution lines, 15:21861 (R;JP;In Japanese)
Improvement of the insulation near the interface to semiconducting layer on EHV XLPE cables by an additive, 15:21862 (R;JP;In Japanese)
Prediction method of unburned carbon concentration in fly ash. Evaluation of combustibility by considering macerals in coal, 15:21166 (R;JP;In Japanese)

Centre de Recherches en Physique des Plasmas, Lausanne (Switzerland)
Invited and contributed papers presented at the 14. International conference on infrared and millimeter waves, 15:22325 (R;CH)

Ceramatec, Inc., Salt Lake City, UT (USA)
Development of planar-geometry solid oxide fuel-cell technology: Phase 2. Annual report, October 1987-October 1988, 15:21958 (R;US)

Chemsyn Science Labs., Lenexa, KS (USA)
Molecular probes for elucidating mechanisms of action of chemical threat agents. Annual report, 15 February 1988-14 February 1989, 15:22490 (R;US)

Colorado Office of the Governor, Denver, CO (USA)
[Rocky Mountain regional low-level waste compact development and establishment of disposals]: Final report, 15:21466 (R;US)

Colorado State Univ., Fort Collins, CO (USA)
Parallel functional computation. Final report, 15 June 1986-14 August 1989, 15:23204 (R;US)

Colorado State Univ., Fort Collins, CO (USA). Dept. of Electrical Engineering
Cw ultraviolet laser excited with an electron beam. Final report, 1 July 1987-30 June 1989, 15:22318 (R;US)
Finite-element model of ultrasonic NDE [nondestructive evaluation], 15:22109 (R;US)

Colorado State Univ., Fort Collins, CO (USA). Solar Energy Applications Lab.
Developing, testing, evaluating and optimizing solar heating and cooling systems: Project status report, January 1, 1990–February 28, 1990, 15:21626 (R;US)

Columbia Univ., New York, NY (USA)
Coal surface control for advanced fine coal flotation: Quarterly report No. 5, October 1, 1989–December 31, 1989, 15:21147 (R;US)
[Laser enhanced chemical reactions]: Technical progress report, March 1, 1989–February 28, 1990, 15:22230 (R;US)

Combustion Engineering, Inc., Birmingham, AL (USA). Environmental Systems Div.
An investigation of precipitator wide plate spacing: Final report, 15:21661 (R;US)

Commission of the European Communities, Abingdon (UK). JET Joint Undertaking
3/2 or 5/2 for convective thermal transport?, 15:23053 (R;GB)
A comparison between beryllium and graphite as materials for JET limiters and wall surfaces, 15:23131 (R;GB)
A predictive equilibrium code for JET, 15:23052 (R;GB)
Gas release on venting the JET torus, 15:23054 (R;GB)

Commission of the European Communities, Brussels (Belgium)
ECSC coal research annual report 1988, 15:21163 (R;XE)

Commonwealth Edison Co., Chicago, IL (USA)
Utility industry evaluation of the Sodium Advanced Fast Reactor: Final report, 15:21795 (R;US)
Utility industry evaluation of the Power Reactor Inherently Safe Module: Final report, 15:21796 (R;US)
Utility industry evaluation of the metal fuel facility and metal fuel performance for liquid metal reactors: Final report, 15:21797 (R;US)

CONEG Policy Research Center, Inc., Washington, DC (USA)
Northeast Regional Biomass Energy Program: Progress report, October 1989 – December 1989, 15:21589 (R;US)

Connecticut Univ., Storrs, CT (USA)
Workshop on problems in chemical toxicology. Final report, 19-20 June 1980, 15:22488 (R;US)

Coordinating Research Council, Inc., Atlanta, GA (USA)
CRC (Coordinating Research Council) octane number requirement survey, 1988, 15:21306 (R;US)

Competitive position of natural gas: Ferrous-metal heat treating and atmosphere generation, February 1988, 15:21368 (R;US)

Hanford Engineering Development Lab., Richland, WA (USA)
Engineering test plan for US/UK higher actinides irradiations tests, 15:21775 (R;US)

Harvard Univ., Cambridge, MA (USA)
Synchrotron studies of x-ray reflectivity from surfaces, 15:22107 (R;US)

Haztech Canada, Edmonton, AB (Canada)
Haztech Canada '88: Dangerous goods and hazardous waste management conference proceedings, 15:22781 (R;CA)

Hiroshima Univ., Takehara (Japan). Research Inst. for Theoretical Physics
Affine Toda field theory and exact S-matrices, 15:22913 (R;JP)

Houston Univ., TX (USA). Dept. of Chemistry
Reactions of atmospheric species with clean and H, C, and O implanted species. Final report, 1 April 1986-15 July 1989, 15:22494 (R;US)

Howell Mayhew Engineering, Inc., Edmonton, AB (Canada)
Assessment of cost effectiveness of R-2000 energy measures in the prairies, 15:21974 (R;CA)

I

Idaho Dept. of Fish and Game, Lewiston, ID (USA)
Protection of wild adult steelhead in Idaho by adipose fin removal: Five year completion report: Final report, 15:21604 (R;US)

Idaho National Engineering Lab., Idaho Falls, ID (USA)
TMI-2 EPICOR-II Resin/Liner Investigation: Low-level waste data base development program for fiscal year 1989: Annual report, 15:21841 (R;US)

Idaho Univ., Moscow, ID (USA). Dept. of Bacteriology and Biochemistry
Bioprocessing of lignite coals using reductive microorganisms: Progress report No. 3, August 15, 1989–January 31, 1990, 15:21125 (R;US)

IEA Heat Pump Center, Eggenstein-Leopoldshafen (Germany, F.R.)
Proceedings of the workshop on ground-source heat pumps, 15:21975 (R;DE)

Illinois Univ., Chicago, IL (USA). Dept. of Physics
Studies in theorectical high energy particles physics: Technical progress report, February 1989–February 1990, 15:22899 (R;US)

Illinois Univ., Urbana, IL (USA)
D^0–$\bar{D}^0$ mixing and CP violation: Experimental projections for a τ-charm factory, 15:22903 (R;US)
Development of advanced nodal diffusion methods for modern computer architectures, 15:21723 (D;US)
Mechanisms for stream corridor protection. Final report, 15:22614 (R;US)
Review of charm decay results, 15:22897 (R;US)

Illinois Univ., Urbana, IL (USA). Dept. of Electrical and Computer Engineering
Application of railgun principle to high-velocity hydrogen pellet injection for magnetic fusion reactor refueling: Technical progress report, 15:23109 (R;US)

Illinois Univ., Urbana, IL (USA). Fusion Technology Lab.
Results from recent hydrogen pellet acceleration studies with a 2-m railgun, 15:23106 (R;US)

Imatran Voima Oy (IVO), Helsinki (Finland)
Heavy metal contents and natural radioactivity of fuel peat, 15:21154 (R;FI;In Finnish)
Reliability importance measures and their calculation, 15:21491 (R;FI)

In-Situ, Inc., Laramie, WY (USA)
Hydrologic characterization of coal seams for methane recovery. Final report, January 1987-April 1989, 15:21362 (R;US)

Indal Technologies, Inc., Mississauga, ON (Canada)
Improving the design and economics of Darrieus rotor wind turbine: Report on tasks 5 and 6: Cost estimates. Final report, 15:21647 (R;CA)
Structural modelling of Darrieus rotor wind turbines with hinged blades and stabilizing struts: Final report, 15:21646 (R;CA)
Testing of the Indal 6400 VAWT strut modification: Final report, 15:21648 (R;CA)

Indiana Univ. Foundation, Bloomington, IN (USA)
[Toxic organic compounds]: Progress report, 15:21576 (R;US)

Indiana Univ., Bloomington, IN (USA)
Metal alkoxides: Models for metal oxides: Alkoxide ligands in early transition metal organometallic chemistry: Progress report, 15:22221 (R;US)

Institute for Defense Analyses, Alexandria, VA (USA)
Key themes in Soviet published sources on the Federal Republic of Germany, 15:22091 (R;US)

Institute for the Study of Intelligent Systems, Ann Arbor, MI (USA)
Genetic adaptive system for image understanding and learning research. Phase 1. Final technical report, 1 February-1 August 1989, 15:23206 (R;US)

Institute of Atomic Energy, Otwock-Swierk (Poland)
The analysis of the influence of the current regulation on the parameters of the MHD-genarator Faraday's type and on the mutual work of the generator and electric power network, 15:21954 (R;PL;In Polish)
The analysis of the probability of the brittle fracture of the reactor EWA construction elements, 15:21776 (R;PL;In Russian)
The body contents of gamma emitters in adults after the Chernobyl accident and an estimation of exposure for intakes in 1986, 15:21801 (R;PL;In Polish)
The influence of chosen parameters of iodine-125 produced by IPRC on iodination of adrenocorticotropic hormone (ACTH): The comparison of Nasup 125I preparations produced by three different technological methods, 15:22232 (R;PL;In Polish)

Institute of Gas Technology, Chicago, IL (USA)
Biodegradation of old town gas site wastes, 15:21595 (R;US)
Charge/discharge characteristics of high-capacity methane adsorption storage systems, 15:21370 (R;US)
Determination of flow-regime boundaries for cohesive particles: Project 61093 Quarterly report, March 20–June 19, 1989, 15:21149 (R;US)
IGT world reserves survey: A survey of United States and total world production, proved reserves, and remaining recoverable resources of fossil fuels and uranium as of December 31, 1987, 15:21161 (R;US)
Methanogenic gasification of wood, 15:21580 (R;US)
Overview of gas distribution, 15:21371 (R;US)

Integrated Systems, Inc., Palo Alto, CA (USA)
R&D plans for advanced computer and control technologies: Volume 2, Instrumentation and control systems: Final report, 15:21655 (R;US)

International Atomic Energy Agency, Vienna (Austria)
Cycling of the main natural alpha emitters in the coastal marine environment: Final report for the period 1 March 1986 - 30 June 1989, 15:22602 (R;XA)
Design, development and construction of an X-ray total reflection module: Final report for the period 15 March 1986 - 11 March 1989, 15:22433 (R;XA)
Development of ^{99m}Tc-labelled the d,1-diasteroisomer of HM-PAO for cerebral blood flow imaging: Final report for the period 15 December 1988 - 22 July 1989, 15:22735 (R;XA)
Impurity control in toroidal devices: Proceedings of a technical committee meeting held in Naka-Gun, Japan, 13-15 February 1989, 15:22998 (R;XA)
Status, experience and future prospects for the development of probabilistic safety criteria: Report of a technical committee meeting held in Vienna, 27-31 January 1986, 15:21802 (R;XA)

International Bank for Reconstruction and Development, Washington, DC (USA)
Current state of atmospheric fluidized-bed combustion technology, 15:21170 (R;US)
Philippines: Environment and natural resource management study. World Bank country study, 15:21907 (R;US)
Striking a balance: The environmental challenge of development, 15:21899 (R;US)

International Fuel Cells Corp., South Windsor, CT (USA)
Advanced on-site power plant development technology program: Final report, 15:21956 (R;US)

Interstate Oil Compact Commission, Oklahoma City, OK (USA)
Technology transfer to US oil producers: A policy tool to sustain or increase oil production, 15:21318 (R;US)

Iowa Univ., Iowa City, IA (USA)
Particle simulations in magnetospheric plasmas. Final Technical report, 1 November 1988-31 October 1989, 15:23062 (R;US)

IRTA, Clarence Creek, ON (Canada)
How to use the CSA B415 performance standard to improve furnace efficiency, 15:21587 (R;CA)

J

Jacobs Engineering Group, Inc., St. Charles, MO (USA)
Remedial investigations for quarry bulk wastes: Revision 1, 15:21472 (R;US)
Temporary storage area characterization report: Revision 1, 15:21471 (R;US)

Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment
Evaluation of neutron nuclear data for ^{16}O, 15:22925 (R;JP)

Japan Atomic Energy Research Inst., Tokyo (Japan)
A computer code TERFOC-N to calculate doses to the public due to atmospheric releases of radionuclides in normal operations of nuclear facilities, 15:23213 (R;JP;In Japanese)
A feasibility study on the innovative control rod driving mechanism, (1), 15:21736 (R;JP;In Japanese)
A revision of MUTUAL, a computer code for analysing nuclear criticality safety on array system, 15:22254 (R;JP)
A study on continuous monitering and self-started diagnosis with signal validation using DISKET, 15:21737 (R;JP;In Japanese)
Activation cross section data file, (1), 15:22918 (R;JP;In Japanese)
Adaptive learning fuzzy control of a mobile robot, 15:22256 (R;JP;In Japanese)
Analysis of water movement and radionuclide migration in the backfill soil as an engineered barrier, 15:21492 (R;JP;In Japanese)
Annual report of Special Committee on Nuclear Criticality Safety, 15:22255 (R;JP;In Japanese)
Assessment of fuel integrity of the High Temperature Engineering Test Reactor (HTTR) and its permissible design limit, 15:21778 (R;JP;In Japanese)
Basic design for the synchrotron in the Large Synchrotron Radiation Facility, (2), 15:22369 (R;JP;In Japanese)
Computation of synchrotron radiation from bending magnet and wiggler, 15:23214 (R;JP)
Concept design of Advanced Marine Reactor, (2): System design, (1): design study for simplification of system, 15:21710 (R;JP;In Japanese)
Concept design of Advanced Marine Reactor, 3: System design, 2: design study for miniaturization and lighter weight of system, 15:21711 (R;JP;In Japanese)
Current drive and sustain experiments with the bootstrap current in JT-60, 15:23051 (R;JP)
Design criteria, production and total integrity assessment of fuels of the High Temperature Engineering Test Reactor, 15:21777 (R;JP;In Japanese)
Development of lithium isotope separation process using crown compounds, 15:22222 (R;JP;In Japanese)
Development of partitioning method: Precipitation behavior of other elements in separating the transuranic elements group with oxalic acid, 15:21453 (R;JP;In Japanese)
Differential thermal analyzer for research on plutonium fuels and its application to analysis of phase diagrams for alloy systems, 15:21442 (R;JP;In Japanese)
Environmental radiation data, 7: Background dose rate in and around Tokyo measured with portable instruments, 15:22504 (R;JP;In Japanese)
High βp bootstrap tokamak reactor, 15:23050 (R;JP)
Interpretation and handling manual of fusion experimental data monitor system DAISY version 1, 15:23130 (R;JP;In Japanese)
Layered model based on GMDH for reactor noise signals, 15:21719 (R;JP;In Japanese)
Low energy ion generator: Performance results and tests irradiation, 15:22854 (R;JP;In Japanese)
Migration behavior of radionuclide in soil layer of final storage site: Radionuclide migration test in aerated soil layer by radioactive contaminated water, 15:22545 (R;JP;In Japanese)
Migration behavior of radionuclide in soil layer of final storage site: Radionuclide migration test in aerated soil layer by precipitation, 15:22546 (R;JP;In Japanese)
Numerical code 'AEOLUS-E1' for analysing free-boundary resistive MHD mode, 15:23049 (R;JP;In Japanese)
On fabrication of UO_2 microspheres by internal gelation process, 15:21443 (R;JP)
Performance test on testing apparatus for radionuclide migration on ground surface, 15:21493 (R;JP;In Japanese)
Program package for control system design and analysis (DPACS/J), 15:23048 (R;JP;In Japanese)
Reactor accident diagnostic expert system: DISKET, 15:21803 (R;JP;In Japanese)
Reflood experiments in single rod channel under high-pressure condition, 15:21730 (R;JP)
Removal of SO_x and NO_x in coal-fired flue gas by the addition of ozone and ammonia, 15:21159 (R;JP;In Japanese)
Revision of fast reactor group constant set JFS-3-J2, 15:21709 (R;JP;In Japanese)
Studies on tritiated water recycle process, 15:21454 (R;JP;In Japanese)
Study of relationship between MUF correlation and detection sensitivity of statistical analysis, 15:21550 (R;JP;In Japanese)
The development of computational algorithms for manipulator inverse kinematics, 15:22253 (R;JP;In Japanese)
Tritium distribution ratios between the 30 % tributyl phosphate(TBP)-normal dodecane(nDD) organic phase and uranyl nitrate-nitric acid aqueous phase, 15:21452 (R;JP)

Japanese Nuclear Data Committee, Tokai, Ibaraki (Japan)
A nuclear cross section calculation system with simplified input-format: Version 2, (SINCROS-II), 15:22940 (R;JP)

Jet Propulsion Lab., Pasadena, CA (USA)
Plasma accelerator and energy-conversion research. Final report, 4 May 1982-31 October 1982, 15:21960 (R;US)
Results of the 1989 NASA/JPL balloon flight solar cell calibration program, 15:21618 (R;US)
Robust performance of multiple tasks by a mobile robot, 15:22249 (R;US)
Use of a krypton isotope for rapid ion changeover at the Lawrence Berkeley Laboratory 88-inch cyclotron, 15:22360 (R;US)

Johns Hopkins Oncology Center, Baltimore, MD (USA)
Macrodosimetry and microdosimetry in radioimmunotherapy: Progress report, July 15, 1989–July 14, 1990, 15:22953 (R;US)

Jones (J.A.) Applied Research Co., Charlotte, NC (USA)
A compendium of robotic equipment used in hazardous environments: Final report, 15:22252 (R;US)

K

Kansas Univ., Lawrence, KS (USA). Dept. of Geography
Simulation of landscape disturbances and the effect of climatic change: Technical progress report No. 1, [July 1989–February 1990], 15:22501 (R;US)

Kawasaki Steel Corp., Tokyo (Japan)
Determination of impurities in fine ceramics by inductively coupled plasma atomic emission spectrometry, 15:22155 (R;JP)

Kentucky Univ., Lexington, KY (USA). Dept. of Mechanical Engineering
Capillary flow properties of mesh wicks. Interim report, July 1987-August 1988, 15:22270 (R;US)

Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Internationales Buero
Emerging materials by advanced processing. Present and future trends. Powders: Production and processing, consolidation, properties, metallic layers, phase diagrams, 15:22147 (R;DE)

Kernforschungsanlage Juelich GmbH (Germany, F.R.). Inst. fuer Reaktorentwicklung
Measurement of double differential production cross sections for charged particles for the validation of theoretical models used to describe interactions of high energy protons with matter, 15:22885 (R;DE;In German)

Kernforschungsanlage Juelich GmbH (Germany, F.R.). Projektleitung Biologie, Oekologie, Energie (PBE)
Search for indicatory criteria to predict effects of chemical induced stress on ecosystemal level. Vol. 12. Final reports of sponsored projects. Pt. 2, 15:22769 (R;DE;In German)

Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung
Irreversible thermodynamics models and constitutive equations of the irradiation induced deformation and damage accumulating processes, 15:22117 (R;DE;In German)

Kernforschungszentrum Karlsruhe GmbH (Germany, F.R.). Projekt Europaeisches Forschungszentrum fuer Massnahmen zur Luftreinhaltung (PEF)
Cost-effectiveness-analysis of strategies to reduce the SO_2- and NO_x-emissions in Baden-Wuerttemberg considering regional aspects, 15:22505 (R;DE;In German)

Kerntechnischer Ausschuss (KTA), Koeln (Germany, F.R.)
KTA collection of terms and definitions. As of June 30, 1989. To replace publication KTA-GS-12 dated January 16, 1987, 15:21687 (R;DE;In German)

Keystone Center, CO (USA)
Keystone II project on transmission: 1988 Final summary report, 15:21939 (R;US)

Knolls Atomic Power Lab., Schenectady, NY (USA)
The stress corrosion performance of diffusion bonded nickel base alloys, 15:22116 (R;US)

L

La Jolla Inst., CA (USA)
La Jolla Institute workshop on novel ion sources and their applications, held in La Jolla California on August 3-4, 1981, 15:22843 (R;US)

Laboratorio Nacional de Engenharia e Tecnologia Industrial, Sacavem (Portugal). Dept. de Proteccao e Seguranca Radiologica
Cycling of the main natural alpha emitters in the coastal marine environment: Final report for the period 1 March 1986 - 30 June 1989, 15:22602 (R;XA)

Laurentian Univ., Sudbury, ON (Canada). School of Engineering
Effect of pressure and temperature on the surface tension and viscosity: Final report, 15:21304 (R;CA)

Lawrence Berkeley Lab., CA (USA)
Absolute pressure dependence of the second ionization level of EL2 in GaAs, 15:22965 (R;US)
Amorphous silicon detectors in positron emission tomography, 15:22447 (R;US)
Bare soil evaporation at Kesterson Reservoir, Merced County, California: Estimation by physical and chemical methods, 15:22603 (R;US)
Biological soft x-ray contact microscopy: Imaging living CHO-SC1 cells and other biological materials, 15:22756 (R;US)
Calculation of thermodynamic properties for monomeric U(IV) hydrolysis products at 298.15 K and zero ionic strength, 15:21499 (R;US)
Categorizing sound for the establishment of source characteristics, 15:23254 (R;US)
Clinical results of stereotactic hellium-ion radiosurgery of the pituitary gland at Lawrence Berkeley Laboratory, 15:22726 (R;US)
Clinical results of stereotactic helium-ion radiosurgery of the pituitary gland at Lawrence Berkeley Laboratory, 15:22729 (R;US)
Clinical results of stereotactic heavy-charged-particle radiosurgery for intracranial angiographically occult vascular malformations, 15:22730 (R;US)
Clinical-radiological evaluation of sequelae of stereotactic radiosurgery for intracranial arteriovenous malformations, 15:22731 (R;US)
Combined analytical/numerical approaches to solving fluid flow problems in the unsaturated zone at Yucca Mountain, 15:21503 (R;US)
Crystal preparation at LBL 1976 to 1986, 15:22121 (R;US)
Currency-based updates to distributed materialized views, 15:23253 (R;US)
Current experiments in elementary particle physics, 15:22880 (R;US)
Designing a performance based cost-sharing system for the Clean Coal Technology Program, 15:21179 (R;US)
Dynamic extension of the Simulation Problem Analysis Kernel (SPANK), 15:21996 (R;US)
Effects of target size on the comparison of photon and charged particle dose distributions, 15:22728 (R;US)
Electrocatalysts for oxygen electrodes: Final report, 15:21881 (R;US)
Energy technology for developing countries: Issues for the US National Energy Strategy, 15:21911 (R;US)
Enhancement of mass transfer to a rotating cylinder electrode by inert particles suspended in the electrolyte, 15:21880 (R;US)
FMG, RENUM, LINEL, ELLFMG, ELLP and DIMES: Chain of programs for calculating and analyzing fluid flow through two-dimensional fracture networks: Users manuals and listings, 15:22793 (R;US)
Fundamental studies of catalytic gasification: Annual report, October 1, 1988–September 30, 1989, 15:21134 (R;US)
Fundamental studies of catalytic gasification: Quarterly report for October 1, 1989-December 31, 1989, 15:21136 (R;US)
Heavy charged-particle beams for stereotactic radiosurgery, 15:22727 (R;US)
Heavy Ion Fusion Accelerator Research (HIFAR) year-end report, April 1, 1989–September 30, 1989, 15:23133 (R;US)
High resolution transmission electron microscopy study of defect structures in mixed-phase YBaCuO, 15:22972 (R;US)
Infrared absorption study of zinc-doped silicon, 15:22856 (R;US)
Integrated estimation of commercial sector end-use load shapes and energy use intensities: Final report, 15:21944 (R;US)
Intermediate-field transport of contaminants: Multiple areal sources in fractured rock and point sources in porous rock, 15:21497 (R;US)
LAr calorimeter for SCC with a common vacuum bulkhead—a concept to improve hermeticity, 15:22446 (R;US)
Life sciences: Lawrence Berkeley Laboratory, 1988, 15:22755 (R;US)
Magnetic reconnection simulation using the 2.5D em [electromagnetic] direct implicit code AVANTI, 15:23151 (R;US)
Mathematical modelling of infiltration and ventilation, 15:22000 (R;US)
Measurements of e^+e^- pair production at the Bevalac, 15:22893 (R;US)
Model estimates of the contributions of environmental tobacco smoke to volatile organic compound exposures in office buildings, 15:22002 (R;US)
More efficient household electricity use: An international perspective, 15:21998 (R;US)
Nuclear science and engineering at Berkeley: The early days, 15:23196 (R;US)
Nuclear Science Division annual report for the period October 1, 1987–September 30, 1988, 15:22919 (R;US)
Performance of electronic ballast and controls with 34 and 40 watt F40 fluorescent lamps, 15:21995 (R;US)
Photoelectric control of daylight-following lighting systems (Daylight-sensing photocell placement): Final report, 15:21994 (R;US)
Physical design of temporal databases, 15:23252 (R;US)

Plans for the power sector in thirteen major developing countries, 15:21945 (R;US)
Practical aspects of Crosswell tomographic surveys, 15:22794 (R;US)
Radioactive beam production at the Bevalac, 15:22372 (R;US)
Reaction of Tris(cyclopentadienyl)uranium compounds with amines, azides, and related ligands, 15:22235 (R;US)
Reactive absorption of hydrogen sulfide by a polyglycol ether solution of sulfur dioxide, 15:21135 (R;US)
Recent results on jet physics and tests of QCD [Quantum Chromodynamics] in e^+e^- annihilation, 15:22892 (R;US)
Residential end-use load shape data analysis: Final report, 15:21943 (R;US)
Seismic characterization of fracture properties, 15:21502 (R;US)
Simulation of reactive chemical transport in a varying thermal field with reaction-flow coupling, 15:21501 (R;US)
Software quality assurance and software safety in the Biomed Control System, 15:22725 (R;US)
Stability against temperature variations at the ALS, 15:22420 (R;US)
Structures of peptide families by nuclear magnetic resonance spectroscopy and distance geometry, 15:22716 (R;US)
Study of collective effects for the APIARY collider, 15:22370 (R;US)
Study of fractal aperture distribution and flow in fractures, 15:21504 (R;US)
Symposium on high temperature and materials chemistry, 15:22241 (R;US)
Synthesis of alumina-coated SiC whiskers for production of SiC whisker-reinforced alumina composite materials, 15:22150 (R;US)
Technology assessment: Energy-efficient commercial lighting, 15:21997 (R;US)
The ALS [Advanced Light Source]: A third generation light source, 15:22359 (R;US)
The application of vertical seismic profiling and cross-hole tomographic imaging for fracture characterization at Yucca Mountain, 15:21500 (R;US)
The Beam Break-Up Numerical Simulator, 15:22371 (R;US)
The COMIS [Conjunction Of Multizone Infiltration Specialists] infiltration model, 15:22001 (R;US)
The energy conservation potential associated with thermally efficient fluorescent fixtures, 15:21999 (R;US)
The metallurgical mechanisms of solder fatigue, 15:22120 (R;US)
The synthesis and reactivity of organoiridium complexes containing metal-heteroatom bonds, 15:22224 (R;US)
Transient diffusion from a waste solid into water-saturated, fractured porous rock, 15:21498 (R;US)
Vibrational state-resolved differential cross sections for the $D + H_2 \rightarrow DH + H$ reaction, 15:22855 (R;US)

Lawrence Livermore National Lab., CA (USA)

A Lagrangian reactive transport simulator with successive paths and stationary-states: Concepts, implementation and verification: Revision 1, 15:21525 (R;US)
A progress report on the Livermore miniature vacuum tube project, 15:22334 (R;US)
A real-time parallel pipelined data-flow image-processing system, 15:23256 (R;US)
A review of the literature on the toxicity of rare-earth metals as it pertains to the engineering demonstration system surrogate testing: Revision 1, 15:22129 (R;US)
A test of the theory of resonant scattering between analog nuclei, 15:22401 (R;US)
A unified integrated model for sputter coating uniformity, 15:22968 (R;US)
An information-theoretic look at branch-prediction, 15:23231 (R;US)
Application of uncertainty analysis of ignition performance to the Engineering Test Reactor, 15:23149 (R;US)
CALS [Computer-aided Acquisition and Logistic Support] Test Network information exchange user's manual: Revision 1, 15:23255 (R;US)
Chemistry and materials science research report: Second half FY89, 15:22476 (R;US)
Computed tomography of PBX9502 high explosives at Lawrence Livermore National Laboratory, 15:22472 (R;US)
Computer simulations and experiments to study the fracture of rods by flying plates, 15:22468 (R;US)
Core cooling studies at LLNL [Lawrence Livermore National Laboratory] and Sandia, 15:22402 (R;US)
Deep level transient spectroscopy in resistive layers, 15:22191 (R;US)
Demonstration of temperature-insensitive harmonic generation in deuterated l-arginine phosphate, 15:22192 (R;US)
Design and processing of strong-tough microcomposite steels, 15:22119 (R;US)
Deterrence of arms control treaty evasion by suspect site inspections, 15:22093 (R;US)
Development of 3D simulations for heavy ion fusion beam transport and compression problems, 15:23150 (R;US)
Development of a detailed model of petroleum formation, destruction, and expulsion from lacustrine and marine source rocks, 15:21429 (R;US)
Direct evidence of ponderomotive filamentation, 15:23152 (R;US)
Does DNA cytometry have a place in the clinical laboratory?, 15:22719 (R;US)
Domain decomposition for a boundary-value problem with a shock layer, 15:22876 (R;US)
Efficient, high order solution technique for the Liouville equation, 15:22981 (R;US)
Electrochemical corrosion studies on copper-base waste package container materials in unirradiated 0.1 N $NaNO_3$ at 95°C, 15:21524 (R;US)
Environmental corrections for a neutron-induced gamma-ray spectroscopy logging system in an air-filled borehole: Revision 1, 15:22450 (R;US)
Experimental search for free quarks in matter, 15:22896 (R;US)
Fabrication of superconducting cable by explosive compaction, 15:22157 (R;US)
FORTRAN programs for basin analysis and petroleum generation modeling, 15:21206 (R;US)
High-Explosives Applications Facility (HEAF): Final Safety Analysis Report (FSAR), 15:22471 (R;US)
How to select members for an audit team, 15:23201 (R;US)
Hydrodynamic interactions and transport coefficients in a suspension of spherical particles, 15:22276 (R;US)
Improved energy and power balance at Nova targets, 15:23154 (R;US)

Abstracts for the 52nd Annual Meeting of the Meteoritical Society, 15:22822 (R;US)

Lyon-1 Univ., 69 - Villeurbanne (France). Inst. de Physique Nucleaire
Stimulated desorption induced by hydrogen aggregates (E $\leq$120 keV/u) and by heavy ions (E $\leq$ 400 keV/u). Analytical applications, 15:22966 (R;FR;In French)
Wigner-Kirkwood expansion of the quasi-elastic nuclear responses and application to spin-isospin responses, 15:22902 (R;FR)

M

Mainz Univ. (Germany, F.R.)
Studies on the synthesis and characterisation of superheavy elements, 15:22231 (R;DE;In German)

Manitoba Dept. of Natural Resources, Winnipeg, MB (Canada). Fisheries Branch
Evolution of limnological conditions in lakes of the Nelson and Rat-Burntwood river systems after Churchill River diversion and Lake Winnipeg regulation: 1. An overview, 15:21601 (R;CA)

Manitoba Univ., Winnipeg, MB (Canada)
A new design of the University of Manitoba cyclotron for D^- ion acceleration and a study for the beam extraction from the Princeton University AVF cyclotron, 15:22357 (D;CA)

Martin Marietta Energy Systems, Inc., Oak Ridge, TN (USA)
Liquid-phase compositions from vapor-phase analyses: 7, Preliminary calculations concerning arsenic trifluoride (AsFsub 3) and arsenic pentafluoride (AsFsub 5), 15:21450 (R;US)

Martin Marietta Energy Systems, Inc., Piketon, OH (USA)
Performance characteristics of the Fairchild 8A and 8B centrifugal compressors, 15:21445 (R;US)

Maryland Univ., College Park, MD (USA). Center for Automation Research
Vision-based navigation and parallel computing. Annual report No. 1, May 1988-May 1989, 15:23202 (R;US)

Maryland Univ., College Park, MD (USA). Dept. of Computer Science
Parallel logic programming and parallel systems software and hardware. Progress report (Final), 1 April 1988-31 March 1989, 15:23205 (R;US)

Maryland Univ., College Park, MD (USA). Metallurgical Materials Lab.
Metal-matrix composite: Strengthening mechanisms. Annual report, October 1988-September 1989, 15:22164 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (USA)
Cost and uncertainty optimized design of performance-prediction experiments for a nuclear waste container, 15:21470 (R;US)
Plasma transport through the dayside cleft: A source of ionization patches in the polar cap, 15:22837 (R;US)
Residential solar photovoltaic systems: Final report, July 1982–June 1986, 15:21615 (R;US)

Studies in technetium chemistry, Project 1: Evaluation of technetium acetylacetonates as potential cerebral blood flow agents, Project 2: Administrative data, August 1, 1988–August 30, 1989, 15:22724 (R;US)
Trend analysis: Performance monitoring of transformers: Final report: Volume 1, 15:21856 (R;US)
Two-dimensional mapping of dayside convection, 15:22838 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (USA). Center for Space Research
Center of excellence in theoretical geoplasma research. Final report, 1 October 1986-30 September 1989, 15:22839 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (USA). Dept. of Materials Science and Engineering
An investigation of the dislocation structure of the Ni/Ag phase boundary, 15:22106 (R;US)
Radiation disorder and aperiodicity in irradiated ceramics: Progress report, 22 June 1989–31 December 1989, 15:22145 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (USA). Dept. of Nuclear Engineering
An assessment of high-level radioactive waste disposal for advanced reactor fuel cycles, 15:21469 (R;US)
Design of a high-level waste repository system for the United States, 15:21505 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (USA). Plasma Fusion Center
CIT burn control using auxiliary power modulation, 15:22989 (R;US)
Measurements on injected impurity transport in TEXT [Texas Experimental Tokamak] using multiply filtered soft x-ray detectors, 15:22990 (R;US)
TSC [Tokamak Simulation Code] simulations of Alcator C-MOD discharges II: Single X-point, vertically asymmetric scenario, 15:22991 (R;US)

Massachusetts Inst. of Tech., Lexington, MA (USA). Lincoln Lab.
Validation of model of external-cavity semiconductor laser and extrapolation from five-element to multielement fiber-coupled high-power laser, 15:22316 (R;US)

Massachusetts Univ., Amherst, MA (USA)
Computation and graphics in mathematical research: Progress report, June 1, 1989–May 31, 1990, 15:23211 (R;US)

Materials Research Labs., Ascot Vale (Australia)
Preliminary report on the feasibility of high-power electronic warfare (EW) using explosive energy sources, 15:22482 (R;AU)

Max-Planck-Institut fuer Physik und Astrophysik, Garching (Germany, F.R.)
Further observations of rotationally excited far infrared OH16 and OH18 emission in Orion-KL: Tighter constraints on the nature of the emitting region, 15:22815 (R;DE)

Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)
A model for periodic pellet ablation in toroidal plasma confinement experiments, 15:23040 (R;DE)
Beam heating of the neutralizer gas of neutral beam injectors, 15:23128 (R;DE)
Calculation of the resistive ballooning mode growth rate for a class of 3-D MHD equilibria, 15:23042 (R;DE)
Compressibility and resistive ballooning modes, 15:23043 (R;DE)
Current drive via Landau damping of kinetic Alfven wave in toroidal geometry, 15:23038 (R;DE)
Energy transport in ASDEX in relation to theoretical and semi-empirical transport coefficients, 15:23039 (R;DE)
MHD activity during ELMs, 15:23044 (R;DE)
On the generating function of Poincare plots defining one dimensional perturbed Hamiltonian systems, 15:23021 (R;DE)
Plasma angular momentum loss by MHD mode locking, 15:23020 (R;DE)
Proceedings of the 3rd workshop on Wendelstein VII-X, 15:23022 (R;DE)
Report on the low-RF-power and data-acquisition-systems of the 2.45 GHz Lower-Hybrid Transmitter at the ASDEX tokamak, 15:23129 (R;DE)
The ASDEX integrated data analysis system AIDA, 15:23041 (R;DE)

Miami Univ., Oxford, OH (USA). Dept. of Zoology
Biological and ecological site characterization of the Feed Materials Production Center, June 1986–June 1987, 15:21542 (R;US)

Michigan Univ., Ann Arbor, MI (USA). Plasma Experimental Lab.
Multiply-charged ion emission from a cyclotron-resonance-heated plasma ion source, 15:21570 (R;US)

Midwest Research Inst., Cary, NC (USA)
Alternative control technology document: Ethylene oxide sterilization/fumigation operations, 15:22518 (R;US)
Evaluation of emission-control devices at waferboard plants. Final report, 15:22519 (R;US)

Ministerie van Volkshuisvesting, Ruimtelijke Ordening en Milieubeheer, The Hague (Netherlands)
Annual report of the Committee for the environment-effect-reporting for the year 1988, 15:21744 (R;NL;In Dutch)

Ministerie van Volkshuisvesting, Ruimtelijke Ordening en Milieubeheer, The Hague (Netherlands). Directie Stralenbescherming
Exhalation velocity of radon-222 of Dutch building materials and the influence of paint systems, 15:22030 (R;NL;In Dutch)

Ministry of Agriculture, Fisheries and Food, Lowestoft (UK). Directorate of Fisheries Research
Radioactivity in surface and coastal waters of the British Isles, 1988, 15:22604 (R;GB)

Minnesota Univ., Minneapolis, MN (USA)
Lubricated pipelining: Stability of core-annular flow. Part 2, 15:22278 (R;US)

Minnesota Univ., Minneapolis, MN (USA). Dept. of Geology and Geophysics
Data compilation to accompany residence times of Minnesota ground waters. Final report, 15:22609 (R;US)

Minnesota Univ., Navarre, MN (USA). Gray Freshwater Biological Inst.
Genetics of bacteria that utilize one-carbon compounds: Annual report, January 1, 1988–October 15, 1989, 15:21582 (R;US)

Mission Research Corp., Newington, VA (USA)
POSTER user's manual: Version May 1989, 15:23230 (R;US)

Remedial investigations for quarry bulk wastes: Revision 1, 15:21472 (R;US)
Temporary storage area characterization report: Revision 1, 15:21471 (R;US)

Monenco Consultants Ltd., St. Catherines, ON (Canada)
Intergrated retorting combustion system using fixed bed technology: Final report, 15:21418 (R;CA)

Montreal Univ., PQ (Canada). Dept. of Geography
The implications of climate change for natural resources in Quebec, 15:22507 (R;CA)

Morrison Hershfield Ltd., North York, ON (Canada)
Examination of alternative foundation designs for remote wind/diesel systems, 15:21649 (R;CA)

MSE, Inc., Butte, MT (USA)
[Manage, operate and maintain the Component Development and Integration Facility in Butte, MT]: Quarterly technical progress report, October 1–December 31, 1989, 15:21953 (R;US)

Muenchen Univ. (Germany, F.R.). Fakultaet fuer Physik
Retrieval of wind fields from Doppler measurements of a single radar and application on a cold front with narrow rain band, 15:22497 (R;DE;In German)

Muenchen Univ. (Germany, F.R.). Inst. fuer Medizinische Mikrobiologie, Infektions- und Seuchenmedizin
Investigations into the suppression of the nonspecific defence system by ionising radiation, 15:22744 (R;DE;In German)

N

Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands)
Modification of MEA modulator-klystron units enabling short pulse injection into a pulse-stretcher ring, 15:22395 (R;NL)

Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands). Sectie H
New algorithms for one-loop integrals, 15:22911 (R;NL)

National Academy of Sciences - National Research Council, Washington, DC (USA)
Computer Science and Technology Board: Summary of activities, March 15, 1989–March 14, 1990, 15:23212 (R;US)

National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center
A nonlinear high temperature fracture mechanics basis for strain-range partitioning, 15:22124 (R;US)
Application of a two-dimensional unsteady viscous analysis code to a supersonic throughflow fan stage, 15:22272 (R;US)
Atomic hydrogen as a launch vehicle propellant, 15:21574 (R;US)
Density of intercalated graphite fibers, 15:22153 (R;US)
Identification of a cast iron alloy containing nonstrategic elements: Final report, 15:22080 (R;US)
Mean stress and the exhaustion of fatigue-damage resistance, 15:22122 (R;US)
On the application of subcell resolution to conservation laws with stiff source terms, 15:22273 (R;US)
Oxidation effects on the mechanical properties of SiC fiber-reinforced reaction-bonded silicon nitride matrix composites, 15:22182 (R;US)
Presented at the 11th workshop on ceramic coatings for wear and thermal applications, Edmonton, Alberta, 16-17 October 1989, 15:22151 (R;US)
SP-100 power system conceptual design for lunar base applications, 15:21712 (R;US)
Strength and toughness of monolithic and composite silicon nitrides, 15:22154 (R;US)
Tank pressure control experiment on the space shuttle, 15:22258 (R;US)
The experimental evaluation and application of high-temperature solid lubricants, 15:22033 (R;US)
The US space station and its electric power system, 15:21857 (R;US)
Thermal fatigue durability for advanced propulsion materials, 15:22123 (R;US)
Thermodynamic properties of some metal oxide-zirconia systems, 15:22152 (R;US)

National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center
Gravimetric measurements of materials outgassing applied to graphite-epoxy laminates, 15:22180 (R;US)
The winds of high luminosity late-type bright stars. Final report, 15 June 1986-14 June 1989, 15:22816 (R;US)

National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center
Calculation of two-neutron multiplicity in photonuclear reactions, 15:22941 (R;US)

National Aeronautics and Space Administration, Huntsville, AL (USA). George C. Marshall Space Flight Center
The solar activity measurements experiments (SAMEX) for improved scientific understanding of solar activity, 15:22824 (R;US)

National Aeronautics and Space Administration, Moffett Field, CA (USA). Ames Research Center
A diagnostic for determining the quality of single-reference electron correlation methods, 15:22225 (R;US)

National Centre of Tribology, Risley (UK)
Advanced tribological coatings for high-specific-strength alloys. Interim report No. 5, 15:22096 (R;US)

National Cheng Kung Univ., Tainan (Taiwan). Dept. of Chemical Engineering
Production of gas fuel and chemicals by the gasification of waste solid and coal. Report for August 1986-July 1987, 15:21139 (R;TW)

National Energy Board, Ottawa, ON (Canada)
Reasons for decision in the matter of TransCanada Pipelines Ltd. Application pursuant to Part 3 of the National Energy Board Act for a certificate to construct facilities and in the matter of Amoco Canada Petroleum Company Ltd. and Consolidated Edison Company of New York, Inc.,ICG Utilities (Ontario) Ltd.(Gas export and reimport), Indeck Gas Supply Corporation, Western Gas Marketing Limited, West: Volume 1, 15:21366 (R;CA)
Reasons for decision [in the matter of] Esso Resources Canada Limited, Shell Canada Limited, and Gulf Canada Resources Limited. Applications pursuant to part 6 of the National Energy Board Act for Licences to Export Natural Gas., 15:21927 (R;CA)
Reasons for decision [in the matter of] Esso Resources Canada Limited, Shell Canada Limited, and Gulf Canada Resources Limited. Applications pursuant to part 6 of the National Energy Board Act for Licences to Export Natural Gas, 15:21928 (R;CA)
Reasons for decision [in the matter of] Westcoast Energy Inc. Application dated 14 April 1989 for new tolls effective 1 November 1989, 15:21929 (R;CA)
Reasons for decision [in the matter of] Westcoast Energy Inc. Application dated 14 April 1989 for new tolls effective 1 November 1989, 15:21930 (R;CA)
Reasons for decision [in the matter of] Interprovincial Pipe Line Company, a division of Interhome Energy Inc. A toll design study and recommendations in response to NEB [National Energy Board] reasons for Decision RH-4-89, 15:21336 (R;CA)

National Inst. for Occupational Safety and Health, Cincinnati, OH (USA)
NIOSH (National Institute for Occupational Safety and Health) testimony on radiation before the Senate Committee on Commerce, Science, and Transportation, by Elliot Harris, June 28, 1977, 15:22761 (R;US)
NIOSH (National Institute for Occupational Safety and Health) testimony on coal mining before the Subcommittee on Energy and Power, House Committee on Interstate and Foreign Commerce, by Hohn F. Finklea, May 26, 1977, 15:21180 (R;US)
NIOSH (National Institute for Occupational Safety and Health) testimony on coal mine health research before the Subcommittee on Labor Standards, House Committee on Education and Labor, by Edward J. Baier, June 29, 1977, 15:21181 (R;US)
NIOSH (National Institute for Occupational Safety and Health) testimony on mine health research before the Subcommittee on Compensation, Health and Safety; House Committee on Education and Labor, by Edward J. Baier, April 4, 1977, 15:21895 (R;US)
NIOSH (National Institute for Occupational Safety and Health) testimony on mine health research before the Subcommittee on Labor, Senate Committee on Human Resources, by Edward J. Baier, March 31, 1977, 15:21896 (R;US)
NIOSH (National Institute for Occupational Safety and Health) testimony on cotton dust before the House Committee on Education and Labor, Subcommittee on Labor Standards, by James A. Merchant, May 16, 1979, 15:22523 (R;US)
NIOSH (National Institute for Occupational Safety and Health) testimony on OSHA (Occupational Safety and Health Administration) guidelines on biotechnology to DOL (Department of Labor), by J. Donald Millar, August 1985, 15:22717 (R;US)
NIOSH (National Institute for Occupational Safety and Health) testimony on occupational diseases before the Senate Committee on Labor and Human Resources, by Anthony Robbins, April 2, 1979, 15:22734 (R;US)
Registry of Toxic Effects of Chemical Substances (RTECS), 1988 edition. User's guide to the RETECS computer tape, 15:22773 (R;US)
Report on cancer risks associated with the ingestion of asbestos, 15:22772 (R;US)
Walk-through survey report, control technology support for sensor at Ingersoll-Rand Company, Foundry Division, Phillipsburg, New Jersey, March 2, 1989, 15:22514 (R;US)

Walk-through survey report, control technology support for sensor at General Foundry Company, Flagtown, New Jersey, March 1, 1989, 15:22515 (R;US)
Walk-through survey report, control technology support for sensor at Alloy-Tech, Inc., Delran, New Jersey, February 27, 1989, 15:22516 (R;US)

National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Div. of Physical Sciences and Engineering
Investigation of the determination of respirable quartz on filter media using Fourier transform infrared spectrophotometry, 15:22510 (R;US)

National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Div. of Surveillance, Hazard Evaluation and Field Studies
Heart-disease mortality among bridge and tunnel officers exposed to carbon monoxide, 15:22517 (R;US)

Water Science and Technology Board annual report, 1985: [Final report], 15:22595 (R;US)
Water Science and Technology Board annual report, 1984: [Final report], 15:22596 (R;US)

National Technical Information Service, Springfield, VA (USA)
Acousto-optical laser modulators and deflectors. October 1987-December 1989 (Citations from the COMPENDEX data base). Report for October 1987-December 1989, 15:22327 (R;US)
Activated charcoal filters: Water treatment, pollution control, and industrial applications. October 1970-October 1989 (Citations from the US Patent data base). Report for October 1970-October 1989, 15:22705 (R;US)
Air-pollution sampling of particles. February 1981-April 1986 (Citations from the NTIS data base). Report for February 1981-April 1986, 15:22536 (R;US)
Air-pollution sampling of particles. May 1986-January 1990 (Citations from the NTIS data base). Report for May 1986-January 1990, 15:22537 (R;US)
Allende meteorite: Cosmic rosetta stone. September 1972-November 1989 (Citations from the International Aerospace Abstracts data base). Report for September 1972-November 1989, 15:22825 (R;US)
Automobile air pollution: Automotive fuels. August 1970-January 1990 (Citations from the NTIS data base). Report for August 1970-January 1990, 15:22083 (R;US)
Battery separators. October 1971-October 1989 (Citations from the US Patent data base). Report for October 1971-October 1989, 15:21882 (R;US)
Benzene toxicity. March 1978-July 1989 (Citations from the Life Sciences Collection data base). Report for March 1978-July 1989, 15:22775 (R;US)
Cogeneration: Economic and technical analysis. February 1987-January 1988 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for February 1987-January 1988, 15:22055 (R;US)
Cogeneration: Economic and technical analysis. February 1988-December 1989 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for February 1988-December 1989, 15:22056 (R;US)
Cogeneration: Economic and technical analysis. October 1986-September 1987 (Citations from the COMPENDEX data base). Report for October 1986-September 1987, 15:22058 (R;US)
Cogeneration: economic and technical analysis. October 1987-December 1989 (Citations from the COMPENDEX data base). Report for October 1987-December 1989, 15:22059 (R;US)
Computational fluid dynamics: Complex flows requiring supercomputers. January 1975-December 1989 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for January 1975-December 1989, 15:22874 (R;US)

Conductive polymers for batteries. January 1979-December 1989 (Citations from the Rubber and Plastics Research Association data base). Report for January 1979-December 1989, 15:21883 (R;US)

Ground subsidence due to mining operations. October 1976-November 1989 (Citations from the COMPENDEX data base). Report for October 1976-November 1989, 15:22576 (R;US)

Hazardous materials waste disposal. June 1987-May 1989 (Citations from the NTIS data base). Report for June 1987-May 1989, 15:22060 (R;US)

Hazardous materials waste disposal. June 1989-January 1990 (Citations from the NTIS data base). Report for June 1989-January 1990, 15:22061 (R;US)

Hydrogen storage: Storage as a gas or liquid. January 1974-December 1989 (Citations from the NTIS data base). Report for January 1974-December 1989, 15:21573 (R;US)

Indium-tin oxide films. January 1976-January 1990 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for January 1976-January 1990, 15:22328 (R;US)

Indoor radon pollution: Control and mitigation. June 1978-December 1989 (Citations from the NTIS data base). Report for June 1978-December 1989, 15:22534 (R;US)

Industrial heating technology. August 1983-November 1989 (Citations from the COMPENDEX data base). Report for August 1983-November 1989, 15:22053 (R;US)

Metals recovery from wastes. May 1988-December 1989 (Citations from the COMPENDEX data base). Report for May 1988-December 1989, 15:22057 (R;US)

Nuclear magnetic resonance: Applications in the food industry. January 1972-December 1989 (Citations from the Food Science and Technology Abstracts data base). Report for January 1972-December 1989, 15:22736 (R;US)

Oil spill removal: Dispersants, absorbants, booms, and skimmers. March 1978-May 1989 (Citations from the Life Sciences Collection data base). Report for March 1978-May 1989, 15:21330 (R;US)

Radioactive waste disposal: Waste Isolation Pilot Plants (WIPP). March 1978-November 1989 (Citations from the NTIS data base). Report for Mar 78-Nov 89, 15:21520 (R;US)

Remote sensing applied to environmental-pollution detection and management. July 1987-January 1990 (Citations from the NTIS data base). Report for July 1987-January 1990, 15:22535 (R;US)

Sol-gel processes and materials. November 1971-October 1989 (Citations from the US Patent data base). Report for November 1971-October 1989, 15:22206 (R;US)

Solid-waste incinerators. September 1970-October 1989 (Citations from the US Patent data base). Report for September 1970-October 1989, 15:22054 (R;US)

Supercomputers. December 1985-January 1988 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for December 1985-January 1988, 15:23223 (R;US)

Supercomputers. February 1988-December 1989 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for February 1988-December 1989, 15:23224 (R;US)

Toxicity of mercury and mercury compounds. May 1978-August 1989 (Citations from Pollution Abstracts). Report for May 1978-August 1989, 15:22774 (R;US)

Transgenic plants and animals: Altered organisms from recombinant DNA technology. July 1982-July 1989 (Citations from the Life Sciences Collection data base). Report for July 1982-July 1989, 15:22718 (R;US)

Transputers and the occam programming language. January 1975-October 1988 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for January 1975-October 1988, 15:23225 (R;US)

Transputers and the OCCAM programming language. November 1988-December 1989 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for November 1988-December 1989, 15:23226 (R;US)

Tribology. June 1970-May 1985 (Citations from the NTIS data base). Report for June 1970-May 1985, 15:22288 (R;US)

Tribology. June 1985-December 1989 (Citations from the NTIS data base). Report for June 1985-December 1989, 15:22289 (R;US)

Water treatment by reverse osmosis. November 1970-October 1989 (Citations from the US Patent data base). Report for November 1970-October 1989, 15:22704 (R;US)

Wind turbines and generators for wind power plants. January 1976-April 1985 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for January 1976-April 1985, 15:21650 (R;US)

Wind turbines and generators for wind power plants. May 1985-December 1989 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for May 1985-December 1989, 15:21651 (R;US)

Nauchno-Issledovatel'skij Inst. Ehlektrofizicheskoj Apparatury, Leningrad (USSR)

Spatial gradiometer for direct current instability detection, 15:22326 (R;SU;In Russian)

Naval Civil Engineering Lab., Port Hueneme, CA (USA)

Initiation decision report: Nonpoint source discharge. Technical note (Final), July 1987-June 1988, 15:22587 (R;US)

Naval Ocean Research and Development Activity, NSTL, MS (USA)

Analysis of enclosed internal-combustion-engine operation with water as the working fluid. Technical note, 15:22078 (R;US)

Naval Ocean Systems Center, San Diego, CA (USA)

Environmental feasibility of using wetlands to treat runoff pollution. Final report, 15:22588 (R;US)

Laser action from a tetramethylpyrromethene BF_2 complex, 15:22314 (R;US)

LiCl-$AlCl_3$-$SOCl_2$ system: Structures, species, and equilibria, 15:21878 (R;US)

Naval Weapons Center, China Lake, CA (USA)

Coso Monitoring Program, October 1987 through September 1988. Summary report, October 1987-September 1988, 15:21629 (R;US)

Nederlandse Vereniging voor Stralingshygiene, Eindhoven (Netherlands)

Emergency reception of accidents and incidents in working with ionizing radiation, 15:22759 (R;NL;In Dutch)

A method for estimating annual dose equivalent to the lung under varying radon progeny conditions, 15:21969 (R;US)

Oak Ridge Gaseous Diffusion Plant, TN (USA)
Area Over Length (AOL): A program for the calculation of effective two-dimensional thermal conductance through an arbitrarily shaped region, 15:22978 (R;US)
Development of ceramic membranes for gas separation: FY 1989 development activities, 15:21133 (R;US)

Oak Ridge National Lab., TN (USA)
A menu-driven program for determining properties of aqueous lithium bromide solutions, 15:22050 (R;US)
A nonintrusive method for measuring the operating temperature of a solenoid-operated valve, 15:22281 (R;US)
Activation of cobalt by neutrons from the Hiroshima bomb, 15:22760 (R;US)
Alpha-particles as probes of nuclear shape in the rare earths and structure effects on proton emission in the mass 80 region, 15:22914 (R;US)
Analysis of proposed post-closure alternatives for the Bear Creek Burial Grounds, 15:21515 (R;US)
Assessing integrated resource plans prepared by electric utilities, 15:21946 (R;US)
Biological effects of changes in surface water acid-base chemistry: State-of-Science/Technology report 13, 15:22607 (R;US)
Born expansions for charged particle scattering, 15:22850 (R;US)
Bremsstrahlung induced by 50 MeV H^0 bombardment, 15:22957 (R;US)
Building Thermal Envelope Systems and Materials (BTESM) and research utilization/technology transfer progress report for DOE

[Department of Energy] Office of Buildings and Community Systems: Monthly progress report, December 1989 and January 1990, 15:22029 (R;US)

Calculating coherent pair production with Monte Carlo methods, 15:22898 (R;US)

Calculations of Auger-cascade-induced reactions with DNA in aqueous solution, 15:22750 (R;US)

Characterization of ceramic matrix composites fabricated by chemical vapor infiltration, 15:22168 (R;US)

Chemistry and structure of coals: Effects of grinding media on a subbituminous coal, 15:21117 (R;US)

Collective aspects of charged particle track structure, 15:22956 (R;US)

Contingency plan for the Oak Ridge National Laboratory liquid low-level waste system, 15:21518 (R;US)

Corrosion properties of Fe_3Al in H_2S-H_2-H_2O mixtures, 15:21120 (R;US)

Cryogenic testing of fluoropolymer-coated stainless steel tubing, 15:22285 (R;US)

Current applications of vibration monitoring and neutron noise analysis: Detection and diagnosis of structural degradation of reactor vessel internals resulting from operational aging, 15:21849 (R;US)

Design of a simulation interface for a parellel computing environment, 15:22591 (R;US)

Design of a telerobotic controller with joint torque sensors, 15:22250 (R;US)

Development of a robust model-based reactivity control system, 15:21734 (R;US)

Difference in electron thermal diffusivity and profile between interior and exterior of TFTR L-mode plasmas, 15:22988 (R;US)

Direct imaging of the atomic structure and chemistry of defects and interfaces by Z-contrast STEM [scanning transmission electron microscopy], 15:22138 (R;US)

Effects of environmental and physiological variables on the uptake of hydrophobic contaminants by the gills of rainbow trout, Salmo gairdneri (Richardson), 15:22598 (R;US)

Environmental protection for hazardous materials incidents, 15:22783 (R;US)

Environmental regulatory update table, January 1990, 15:22550 (R;US)

Environmental regulatory update table, February 1990, 15:22551 (R;US)

Environmental sciences division long-range plan: FY 1990 to FY 1994, 15:22552 (R;US)

Estimation of nonfuel operation and maintenance costs for advanced circulating fluidized-bed and advanced natural gas-fired combined cycle power plants, 15:21669 (R;US)

Fossil Energy Advanced Research and Technology Development Materials Program: Semiannual progress report for the period ending September 30, 1989, 15:22094 (R;US)

Fusion reactor materials semiannual progress report for the period ending September 30, 1989, 15:23108 (R;US)

High elongation plasmas, 15:22987 (R;US)

High-temperature crack-arrest tests using 152-mm-thick SEN wide plates of low-upper-shelf base material: Tests WP-2.2 and WP-2.6, 15:21700 (R;US)

Hybrid Intelligent Perception System: Intelligent perception through combining Artificial Neural Networks and an Expert System, 15:23210 (R;US)

Implementation of a control system test environment in UNIX, 15:22321 (R;US)

Implementing a new TLD system, 15:22749 (R;US)

Licensee Event Report (LER) compilation for month of January 1990, 15:21715 (R;US)

Mechanical behavior of whisker reinforced ceramics, 15:22141 (R;US)

Mercury monitoring of water and sediment in Oak Ridge National Laboratory streams during 1989, 15:22606 (R;US)

NEACRP standard problem exercise on criticality codes for dissolving fissile oxides in acids: A reference method for treating the fuel double heterogeneity, 15:21718 (R;US)

Optimization of the PS-2 core configuration for the ANS [Advanced Neutron Source] Reactor, 15:21781 (R;US)

Particle transport in pellet fueled JET [Jet European Torus] plasmas, 15:23139 (R;US)

Particulate matter dynamics and phytoplankton seasonality in a reservoir embayment ecosystem, 15:22608 (R;US)

Performance characterization research at Oak Ridge National Laboratory, 15:23209 (R;US)

Periodic trajectories for two-dimensional nonintegrable Hamiltonians, 15:22979 (R;US)

Permeability of membranes fabricated at ORGDP [Oak Ridge Gaseous Diffusion Plant], 15:21137 (R;US)

Personal computer based decision support system for routing nuclear spent fuel, 15:21457 (R;US)

Populations of excited states and reaction mechanisms in the emission of complex fragments, 15:22926 (R;US)

Precursors to potential severe core damage accidents: 1988 a status report: Appendixes B and C, 15:21840 (R;US)

Research and development quality assurance planning, 15:23198 (R;US)

Results of the independent verification of radiological remedial action at 433 South 2nd East Street, Monticello, Utah (MS00103), 15:21543 (R;US)

Results of the independent verification of radiological remedial action at 416 South Main Street, Monticello, Utah (MS00150), 15:21544 (R;US)

Results of the independent verification of radiological remedial action at 281 East 3rd South Street, Monticello, Utah (MS00138), 15:21545 (R;US)

Results of the independent verification of radiological remedial action at 280 South 3rd East Street, Monticello, Utah (MS00099), 15:21516 (R;US)

Results of the independent verification of radiological remedial action at 217 South 2nd East Street, Monticello, Utah (MS00097), 15:21517 (R;US)

Results of the independent verification of radiological remedial action at 165 North 1st West Street, Monticello, Utah (MS00014), 15:21546 (R;US)

Robot navigation research using the HERMIES mobile robot, 15:22248 (R;US)

Robust performance of multiple tasks by a mobile robot, 15:22249 (R;US)

The basis spline method and associated techniques, 15:22976 (R;US)

The ORNL [Oak Ridge National Laboratory] liquid nitrogen simulation facility, 15:21789 (R;US)

The Survivable Optics MODIL [Manufacturing Operations Development and Integration Laboratory]: Guidelines for forming R and D consortia from the theory of clubs, 15:22485 (R;US)

The transportation operations system: A description, 15:21456 (R;US)

TMI-2 EPICOR-II Resin/Liner Investigation: Low-level waste data base development program for fiscal year 1989: Annual report, 15:21841 (R;US)

Trend detection in the presence of covariates: Stagewise versus multiple regression, 15:22590 (R;US)

United States Historical Climatology Network (HCN) serial temperature and precipitation data, 15:22509 (R;US)

URR [Unresolved Resonance Region] computer code: A code to calculate resonance neutron cross-section probability tables, Bondarenko self-shielding factors, and self-indication ratios for fissile and fertile nuclides, 15:22920 (R;US)

$Y_1Ba_2Cu_3O_{7-x}$ laser-ablation plume dynamics measurement by nanosecond response ion probe: Comparison with optical measurements, 15:22453 (R;US)

[Environmental protection for hazardous materials incidents]: Foreign trip report, February 4, 1990–February 9, 1990, 15:22259 (R;US)

[Reactor shielding experiments and analysis]: Foreign trip report, February 10–16, 1990, 15:23137 (R;US)

[Rural electrification: Grid extension, decentralization, and financing]: Foreign trip report, January 28, 1990–February 9, 1990, 15:21947 (R;US)

[Small and Medium-Size Reactor Expert Group]: Foreign trip report, February 9–14, 1990, 15:21688 (R;US)

[The role of colloidal particles on the subsurface transport of contaminants]: Foreign trip report, January 31, 1990–February 9, 1990, 15:21514 (R;US)
[Thermonuclear experimental reactor workshop on materials and components]: Foreign trip report, January 27, 1990–February 14, 1990, 15:23138 (R;US)

Oak Ridge National Lab., TN (USA). Applied Technology Div.
An interim report on the materials and selection criteria analysis for the Compact Ignition Tokamak toroidal field coil turn-to-turn insulation system: Volume 2, Photographic summary of laboratory testing: Interim results, 15:23134 (R;US)

Oak Ridge National Lab., TN (USA). Center for Engineering Systems Advanced Research
Concept formation and generalization based on experimentation by an autonomous mobile robot, 15:22247 (R;US)

Oak Ridge National Lab., TN (USA). Fusion Engineering Design Center
Equilibrium calculations for plasma control in CIT [Compact Ignition Tokamak], 15:23135 (R;US)
NUFACE: An interface code for the calculation of nuclear responses, 15:23136 (R;US)
TSC [Tokamak Simulation Code] disruption scenarios and CIT [Compact Ignition Tokamak] vacuum vessel force evolution, 15:23063 (R;US)

Oak Ridge National Lab., TN (USA). Hazwrap Support Contractor Office
Minutes from Department of Energy Hazardous Waste Remedial Actions Program Technology Demonstration Program FY 1990 waste site review and ranking meeting, 15:21465 (R;US)

Office of Technology Assessment (U.S. Congress), Washington, DC (USA)
Catching our breath: Next steps for reducing urban ozone, 15:22512 (R;US)
High-performance computing and networking for science. Background paper, 15:23222 (R;US)

Oklahoma State Univ., Stillwater, OK (USA). Dept. of Biochemistry
[The structure of pectins from cotton suspension culture cell walls]: Progress report, 15:22713 (R;US)

Oklahoma State Univ., Stillwater, OK (USA). Dept. of Botany and Microbiology
Genetic, physiological and nutritional studies on Clostridium strains isolated and screened for characteristics useful in enhanced oil recovery, with special reference to high salt tolerance: Final report, 15:21285 (R;US)

Oklahoma State Univ., Stillwater, OK (USA). Dept. of Physics
On the uniqueness of the radiation amplitude zero in radiative W decay, 15:22900 (R;US)

Oklahoma Univ., Norman, OK (USA)
Energetics of end product excretion in anaerobic bacteria and the metabolism of fatty acids by Syntrophomonas wolfei: Progress report, December 16, 1985–November 15, 1986, 15:22710 (R;US)
Energetics of end product excretion in anaerboic bacteria and the metabolism of fatty acids by Syntrophomonas wolfei: Final report, March 15, 1985–March 14, 1989, 15:21581 (R;US)
Nuclear spectroscopy of neutron-rich odd-A N = 61 isotones in the deformed A $\approx$ 100 region, 15:22873 (D;US)
Study of transitional nuclei at TRISTAN: Progress report, 15:22929 (R;US)

Oklahoma Univ., Oklahoma City, OK (USA). Health Sciences Center
Effect of exposure to microwaves on the neuroendocrine status of the rat. Final report, 1 January 1979-30 June 1980, 15:22778 (R;US)

Old Dominion Univ., Norfolk, VA (USA)
Computational solution of chemistry problems. Final report, period ending 30 June 1988, 15:22508 (R;US)

Old Dominion Univ., Norfolk, VA (USA). Dept. of Oceanography
Continental shelf processes affecting the oceanography of the South Atlantic Bight: Progress report, June 1989–May 1990, 15:22789 (R;US)

Ontario Hydro Research Div., Toronto, ON (Canada)
A magnetic field probe for use in extremely low frequency (ELF) animal exposure systems, 15:21874 (R;CA)
A review of hydrogeological and geochemical data from three Ontario Hydro fly ash disposal sites, 15:21662 (R;CA)
Assessment of Substitute N_2O in flue gas, 15:21664 (R;CA)
Atikokan TGS [thermal generating station] aquatic studies, 1981 to 1988. 3 . Plankton and macrophytes, 15:21668 (R;CA)
Comments on the analysis of occupational exposure to PCBs and various cancers by the industrial disease standard panel, 15:22782 (R;CA)
Ear Falls GS [generating station]: Foundation investigation, 15:21598 (R;CA)
Electrical conductivity of insulator surface ices, 15:21869 (R;CA)
Estimates of air pollutants concentrations and deposition due to electricity exports during the period 1991-2006, 15:21667 (R;CA)
Ferroresonance tests on T14 tertiary at Claireville TS [transmission station], 15:21865 (R;CA)
Long-term economic outlook: Annual review, 15:21891 (R;CA)
Methods for measuring the air heater leakage in a coal fired thermal generating station, 15:21659 (R;CA)
Physical properties of a fly ash slurry: A laboratory investigation, 15:21665 (R;CA)
Properties of waste by-products from limestone (lime) dual alkali and limestone (lime) wet scrubbing processes: A literature study, 15:21663 (R;CA)
Residential magnetic field: Accounting for external sources and residential grounding circuits, 15:21873 (R;CA)
Short-term economic outlook: Annual review, 15:21890 (R;CA)
Suitability of inclined plate anchors for guyed transmission towers, 15:21871 (R;CA)
Thermal performance and delivery capability of a 350-litre electric storage water heater, 15:22028 (R;CA)
Transmission line refurbishment study: Tests on Kingston type steel transmission towers. Smith Falls, 15:21870 (R;CA)
[Ontario Hydro Research Division] Some notable accomplishments, 1984-88, 15:21913 (R;CA)

Ontario Ministry of Energy, Toronto, ON (Canada)
Assessment of cogeneration opportunities in selected Ontario industrial plants, 15:22049 (R;CA)

Ontario Ministry of Natural Resources, Toronto, ON (Canada)
Oil and gas exploration, drilling production summary, 1986, 15:21203 (R;CA)

Ontario Ministry of the Environment, Dorset, ON (Canada). Water Resources Branch
Chemical and biological data summary for Lake 222 outflow experiments (experimental lakes area) (May 1983), 15:22605 (R;CA)

Ontario Ministry of the Environment, Toronto, ON (Canada). Air Resources Branch
Ambient air quality post-operational survey Part 1: Energy-from-waste plant, Victoria Hospital Corporation, London, Ontario, 15:21593 (R;CA)

Ontario Ministry of Transportation, Downsview, ON (Canada). Transportation Technology and Energy Branch
Natural gas bus implementation at TTC's Lansdowne Garage, 15:22034 (R;CA)

Ontario Research Foundation, Sheridan Park, ON (Canada)
Study of harmonic reduction alternatives for the NSTF [National Solar Test Facility] solar simulation: Final report, 15:21609 (R;CA)

Oregon State Univ., Corvallis, OR (USA). Dept. of General Science
Air pollution-caused changes in photosynthesis: Effects on plant growth and rhizosphere functions: Final report, 15:22500 (R;US)

Ortech International, Mississauga, ON (Canada)
F.H.P. [flash hydrogen pyrolysis] repair: Final report, 15:22284 (R;CA)

Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics
Proceedings of the workshop on few-body systems, 15:22921 (R;JP;In Japanese, English)

Ottawa Univ., ON (Canada). Dept. of Chemistry
Mechanisms for the homogeneous, thermal conversion for methane to ethane and other saturated hydrocarbons: Volumes 1 and 2, 15:21594 (R;CA)

Ottawa Univ., ON (Canada). Dept. of Civil Engineering
Design of low-cost flowthrough rockfill dams and spillways, 15:21600 (R;CA)

Ottawa Univ., ON (Canada). Dept. of Mechanical Engineering
Turbulence measurements in the swirling flow at the entrance to the CCRL [Combustion and Carbonization Research Laboratory] tunnel furance facility, 15:22291 (R;CA)

Oxford Univ. (UK). Inorganic Chemistry Lab.
Synthesis for materials for reversible uptake and useful functionalization of methane. Annual report, January-December 1988, 15:21374 (R;GB)

P

Pacific Consulting Services, Berkeley, CA (USA)
Case studies using WENS-PC and FORECAST MASTER PLUS: Final report, 15:21940 (R;US)

Pacific Gas and Electric Co., San Francisco, CA (USA)
Utility industry evaluation of the Sodium Advanced Fast Reactor: Final report, 15:21795 (R;US)
Utility industry evaluation of the Power Reactor Inherently Safe Module: Final report, 15:21796 (R;US)
Utility industry evaluation of the metal fuel facility and metal fuel performance for liquid metal reactors: Final report, 15:21797 (R;US)

Pacific Gas and Electric Co., San Ramon, CA (USA)
Development and application of a uniform testing procedure for griddles: Final report, 15:21970 (R;US)

Pacific Northwest Lab., Richland, WA (USA)
A demonstration of the applicability of implementing the enhanced Remedial Action Priority System (RAPS) for environmental releases, 15:21522 (R;US)
Alternative materials for solid oxide fuel cells, 15:21959 (R;US)
An exploratory sensitivity study with the MACCS [MELCOR Accident Consequence Code System] Reactor Accident Consequence Model, 15:21850 (R;US)
Environmental monitoring master sampling schedule, January–December 1990, 15:22706 (R;US)
Global warming: A Northwest perspective: Proceedings, 15:22538 (R;US)
Hanford Environmental Dose Reconstruction Project: Monthly report, February 1990, 15:21521 (R;US)
Implications of neutron spectrum and flux defferences on fission-fusion correlations at high neutron fluence, 15:23140 (R;US)
Irradiation creep and swelling of the fusion heats of PCA, HT9 and 9Cr-1Mo irradiated to high neutron fluence, 15:23143 (R;US)
Life-cycle cost comparisons of advanced storage batteries and fuel cells for utility, stand-alone, and electric vehicle applications, 15:21885 (R;US)
Molten salt corrosion of hot-pressed Si_3N_4/SiC-reinforced composites and effects of molten salt exposure on slow crack growth of hot-pressed Si_3N_4, 15:22156 (R;US)
Neutron-induced changes in density and electrical conductivity of copper alloys at 16 to 98 dpa and 420°C, 15:23141 (R;US)
Radiation exposures for DOE and DOE contractor employees, 1987: Twentieth annual report, 15:22751 (R;US)
Radon transport in dry, cracked soil: Two-dimensional, finite element model, 15:22578 (R;US)
Surface environmental surveillance procedures manual: PNL administrative/technical procedures, 15:22493 (R;US)
Tensile behavior and swelling of ternary austenitic alloys irradiated in different neutron spectra, 15:23142 (R;US)
Tritium release from irradiated beryllium at elevated temperatures, 15:23144 (R;US)
Velocity measurements at six fish screening facilities in the Yakima River Basin: Annual report, 1988, 15:21603 (R;US)

Pallister Resource Management, Calgary, AB (Canada)
Arctic offshore technology conference and exposition, 15:22296 (R;CA)

Pan Heuristics, Los Angeles, CA (USA)
Regional rivalries and nuclear responses. Volume 2. The south korean case: A nuclear weapons program embedded in an environment of great power concerns. sanitized. Final report, 8 November 1976-28 February 1978, 15:22483 (R;US)

Parameter, Inc., Elm Grove, WI (USA)
Closeout of IE Bulletin 79-17: Pipe cracks in stagnant borated water systems at PWR [pressurized water reactors] plants, 15:21843 (R;US)
Closeout of IE Bulletin 80-10: Contamination of nonradioactive system and resulting potential for unmonitored, uncontrolled release of radioactivity to the environment, 15:21844 (R;US)
Closeout of IE Bulletin 85-03: Motor-operated valve common mode failures during plant transients due to improper switch settings, 15:21838 (R;US)

Paris-11 Univ., 91 - Orsay (France)
Interaction of a beam of heavy ions with a CO_2 laser produced plasma. Fitting of an ionographic tube and simulation of the experiment, 15:22996 (R;FR;In French)
J/ψ production and the di-muons in oxygen-copper collisions at 200 GeV/nucleon, 15:22884 (R;FR;In French)
Study and development of different techniques for the generation, conversion, propagation, and radiation of high power microwaves for the electronic cyclotron frequency plasma heating, 15:22997 (R;FR;In French)

Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire
BRST construction of interacting gauge theories of higher spin fields, 15:22910 (R;FR)
Experimental study on the magnetized discharge sources (PIG type) for the multicharged ions production, 15:22393 (R;FR;In French)
Experimental study on the secondary emission (atomic and molecular ions, aggregates, electrons) induced by the bombardment of surfaces by means of energetic heavy ions (≈ MeV/u). Effects of the charge state of the projectiles, 15:22962 (R;FR;In French)
Nuclear photoreactions at intermediate energies, 15:22916 (R;FR)
Signals of a phase transition in nuclear breakup, 15:22937 (R;FR)

Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire
An experimental study of e^+e^- annihilation into four leptons at $\sqrt{S} \geq 35$ GeV, 15:22891 (R;FR)
First observation of three pseudoscalar states in the $J/\Psi \rightarrow \gamma\rho\rho$ decay, 15:22888 (R;FR)
Looking at CP invariance and quantum mechanics in $J/\Psi \rightarrow \Lambda antiA$ decay, 15:22889 (R;FR)
Measurement of the reaction $e^+e^- \rightarrow \eta\pi^+\pi^-$ in the center of mass energy interval 1350-2400 MeV, 15:22887 (R;FR)
The pion electromagnetic form factor in the time-like energy range $1.35 \leq \sqrt{s} \leq 2.4$ GeV, 15:22890 (R;FR)
Transition radiation, 15:22949 (R;FR)
Use of an IBM -FPS loosely coupled array of processors for high energy physics programs, 15:23216 (R;FR)

Paris-6 Univ., 75 (France). Lab. de Physique Nucleaire et de Hautes Energies
Neutrino oscillations at accelerators, 15:22894 (R;FR)

Paris-7 Univ., 75 (France)
Experimental study on the secondary emission (atomic and molecular ions, aggregates, electrons) induced by the bombardment of surfaces by means of energetic heavy ions (≈ MeV/u). Effects of the charge state of the projectiles, 15:22962 (R;FR;In French)

Paul Scherrer Inst. (PSI), Wuerenlingen (Switzerland)
Assessment of NJOY generated neutron heating factors based on JEF/EFF-1, 15:21722 (R;CH)
Modelling of a diffusion-sorption experiment on sandstone, 15:22579 (R;CH)
Nucleonic calculations for possible irradiation experiments in SAPHIR, 15:21721 (R;CH)
Radionuclide chain transport with matrix diffusion and non-linear sorption, 15:22580 (R;CH)
Rewetting phenomena and their relation to intermolecular forces between a hot wall and the fluid, 15:22274 (R;CH)

Pechan (E.H.) and Associates, Inc., Springfield, VA (USA)
NAPAP (National Acid Precipitation Assessment Program) emissions inventory (version 2): Development of the national utility reference file, 1985. Final report, January-September 1989, 15:22524 (R;US)

PEI Associates, Inc., Cincinnati, OH (USA)
Incineration of creosote and pentachlorophenol wood-preserving waste-water-treatment sludges. Report for October 1986-September 1989, 15:22051 (R;US)

Pennsylvania State Univ., University Park, PA (USA)
Acoustically enhanced combustion of micronized coal water slurry fuel: Final report, 15:21167 (R;US)
Catalyst dispersion and activity under conditions of temperature-staged liquefaction: Technical progress report, October–December 1989, 15:21126 (R;US)
Generation and mobility of radon in soil: Annual technical progress report, March 1987–February 1990, 15:21540 (R;US)
The model electric restaurant: Volume 1, Restaurant subsystem analysis and evaluation: Final report, 15:22046 (R;US)

Pennsylvania State Univ., University Park, PA (USA). Davey Lab.
Kinetics and mechanism of soot formation in hydrocarbon combustion. Final Technical report, 25 October 1985-28 February 1989, 15:22244 (R;US)

Pennsylvania State Univ., University Park, PA (USA). Environmental Resources Research Inst.
Hypotheses testing of watershed/landscape dynamics in northern Alaska using digital analysis: Final report, July 15, 1986–July 14, 1989, 15:22597 (R;US)

Pennsylvania Univ., Philadelphia, PA (USA)
Theoretical research in nuclear structure and nuclear collective motion: Progress report, March 1, 1989–February 28, 1990, 15:22934 (R;US)

Pennsylvania Univ., Philadelphia, PA (USA). Dept. of Materials Science and Engineering
Experimental evaluation of new alloy coatings. Final report, November 1986-January 1989, 15:22098 (R;US)

Petroleum Society of CIM (Canada)
Mining and energy challenges, 15:21389 (R;CA)

Philadelphia Electric Co., PA (USA)
Utility industry evaluation of the Sodium Advanced Fast Reactor: Final report, 15:21795 (R;US)
Utility industry evaluation of the Power Reactor Inherently Safe Module: Final report, 15:21796 (R;US)
Utility industry evaluation of the metal fuel facility and metal fuel performance for liquid metal reactors: Final report, 15:21797 (R;US)

Pittsburgh Univ., PA (USA). Dept. of Chemical and Petroleum Engineering
Thermodynamics of coal liquid/solid systems: Final report, 15:21127 (R;US)

Pittsburgh Univ., PA (USA). Dept. of Materials Science and Engineering
Program to study the oxidation of carbon-carbon composites and coatings on these materials. Final report, 15 July 1986-13 July 1989, 15:22165 (R;US)

Policy Research Associates, Inc., Reston, VA (USA)
Pilot study of commercial water-loop heat pump compressor life: Final report, 15:21972 (R;US)

Polytechnic Univ., Farmingdale, NY (USA). Weber Research Inst.
Experimental and theoretical study of artificial plasma layers produced by two intersecting beams in a chamber, 15:23060 (R;US)

Praxis Engineers, Inc., Milpitas, CA (USA)
Coal surface control for advanced fine coal flotation: Quarterly report No. 5, October 1, 1989–December 31, 1989, 15:21147 (R;US)

Princeton Univ., NJ (USA). Dept. of Chemistry
Oxide-bound transition metal complexes for methane activation. Final report, September 30, 1986-August 31, 1989, 15:21373 (R;US)

Princeton Univ., NJ (USA). Plasma Physics Lab.
How temperature gradients are determined in toroidal plasmas, 15:23065 (R;US)
The effect of prepulse on x-ray laser development using a powerful subpicosecond KrF* laser, 15:23145 (R;US)
Waves in plasmas: Highlights from the past and present, 15:23066 (R;US)

Princeton Univ., NJ (USA). School of Engineering and Applied Science
Coke formation index: A measure of particulate formation in oil combustion, 15:21350 (R;US)

Principia Mechanica, London (UK)
Optimisation of treatment, storage and disposal strategies for (unconditioned and conditioned) radioactive waste: (Disposals II), 15:21479 (R;GB)

Public Service Electric and Gas Co., Newark, NJ (USA)
Supplemental photosynthetic lighting for greenhouse tomato production: Final report, 15:22045 (R;US)

Q

Queen's Univ., Kingston, ON (Canada). Dept. of Chemical Engineering
Process development of an integrated extractive fermentation system: Part of the Bioenergy Development Program (BDP), 15:21584 (R;CA)

R

Radian Corp., Austin, TX (USA)
Coal gasification: An environmental, health, and safety overview. Topical report, 15:21138 (R;US)
Guideline series: Guidance document for residential wood-combustion emission-control measures, 15:21894 (R;US)
NATICH (National Air Toxics Information Clearinghouse) data base report on state, local, and EPA (Environmental Protection Agency) air toxics activities. Interim report, 15:22520 (R;US)

Radian Corp., Research Triangle Park, NC (USA)
Analysis of state and federal sulfur dioxide emission regulations for combustion sources (revised), 15:22513 (R;US)

Radiation Experiments and Monitors, Oxford (UK)
Use of RADFETS (Radiation-Sensitive Field Effect Transistor) in radiation dose measurement: Report on three lots prepared for the US Army. Final report, 18 June 1987-18 September 1989, 15:22452 (R;GB)

Reid, Collins and Associates Ltd., Vancouver, BC (USA)
Hog fuel availability in the north coastal and interior regions of British Columbia, 1986, 15:21591 (R;CA)

Rensselaer Polytechnic Inst., Troy, NY (USA)
Stabilization of high T_c superconductivity in cadmium sulfide: Progress report, February 1989–February 1990, 15:22172 (R;US)

Research and Productivity Council, NB (Canada)
Intergrated retorting combustion system using fixed bed technology: Final report, 15:21418 (R;CA)

Resource Ventures, Inc., Charlottetown, PE (Canada)
A study on Wind Energy Conversion Systems (WECS), cost evaluation, and prospects for cost reduction: Final report, 15:21645 (R;CA)

Rice Univ., Houston, TX (USA). Dept. of Electrical Engineering
Optimization techniques for feature extraction in automatic pattern recognition. Final report, 15:23246 (R;US)

Rijksinstituut voor Volksgezondheid en Milieuhygiene, Bilthoven (Netherlands)
Reports from the RIVM 1987, 15:22737 (R;NL;In Dutch)
Reports from the RIVM 1988, 15:22765 (R;NL;In Dutch)

Rijksuniversiteit Utrecht (Netherlands)
Application of 1D- and 2D-NMR techniques for the structural studies of glycoprotein-derived carbohydrates, 15:22459 (R;NL)
Experiments on screw-pinch plasmas with elongated cross section, 15:23018 (R;NL)
Luminescence and energy transfer processes in rare earth compounds, 15:22176 (R;NL)
Negative ion sourcery, 15:23113 (R;NL)

Rijksuniversiteit Utrecht (Netherlands). Natuurkundewinkel
Risks attached to container- and bunker-storage of nuclear waste: The two dry storage options of the Dutch Central Organization for Radioactive Waste (COVRA) discussed further, 15:21459 (R;NL;In Dutch)

Rijksverdedigingsorganisatie TNO, Rijswijk (Netherlands). Medisch Biologisch Lab. TNO
Biological dosimetry of radiation damage, 15:22758 (R;NL)
Detection of DNA damage in cells exposed to ionizing radiation by use of antisingle-stranded-DNA monoclonal antibody, 15:22757 (R;NL)

Risoe National Lab., Roskilde (Denmark)
Metallurgy Department publications 1988, 15:22126 (R;DK)

Rochester Univ., NY (USA)
Effect of anticholinesterase agents on airway epithelial function. Annual report, 15 July 1888-14 August 1989, 15:22487 (R;US)

Rochester Univ., NY (USA). Inst. of Optics
Effects of pump modulation on a four-level laser amplifier, 15:22319 (R;US)

Rockwell International Corp., Canoga Park, CA (USA)
LOX/hydrocarbon combustion instability investigation. Final report, 15:22242 (R;US)

Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant
Rocky Flats Plant site environmental report for 1988, January through December 1988, 15:22581 (R;US)
The Terrain-Responsive Atmospheric Code (TRAC) project plan: Development of a hazardous materials dispersion modeling capability with application to ambient air monitoring network design, 15:21523 (R;US)

Roessner (D.C.), Nescopeck, PA (USA)
Simulator requirements manual: Final report, 15:21689 (R;US)

Rototherm, Inc., Howell, NJ (USA)
Modular apparatus for laundry dryer heat recovery: Technical progress report, 15:21968 (R;US)

Royal Military Coll. of Canada, Kingston, ON (Canada). Dept. of Mechanical Engineering
Fundamental flammability data for methanol-based spark-ignition engine fuels, 15:21351 (R;CA)

Rutherford Appleton Lab., Chilton (UK)
A compilation of data on single prompt photon production in hadron -hadron interactions, 15:22895 (R;GB)
Dusty plasmas, 15:23067 (R;GB)
Electromagnetic wave scattering in turbulent plasmas, 15:23068 (R;GB)
Final state effects in deep inelastic neutron scattering, 15:22951 (R;GB)
High energy magnetic neutron scattering in heavy fermion compounds, 15:22967 (R;GB)
HOLRED - a machine for the replay of holograms made in a large bubble chamber, 15:22449 (R;GB)
Magnetospheric plasma physics, 15:22841 (R;GB)
Proceedings of the second workshop on thermal-non-thermal interactions in solar flares [TNT-II]: Held at Somerville College, University of Oxford, England on April 10 - 14, 1989 and arranged by Rutherford Appleton Laboratory, Chilton, Didcot, Oxon., England, 15:22827 (R;GB)
The application of system identification techniques to an R.F. Cavity tuning loop, 15:22361 (R;GB)
The space of string configurations in string field theory, 15:22912 (R;GB)
The tasks of tracking and vertex location at future hadron colliders, 15:22396 (R;GB)
Use of Al XII and Mg XI lines as solar plasma diagnostics, 15:22826 (R;GB)

S

S-Cubed, San Diego, CA (USA)
STREAK damping. Technical report, 15:22474 (R;US)

San Francisco State Univ., CA (USA)
Benzamide prevention of ultraviolet radiation-induced transformation as measured by anchorage-independent growth and absence of correlation with thymidine dimer formation and DNA repair, 15:22738 (R;US)

San Jose State Univ., CA (USA). Dept. of Nutrition and Food Services
Development and application of a uniform testing procedure for griddles: Final report, 15:21970 (R;US)

Sandia National Labs., Albuquerque, NM (USA)
A 10-stage reconnection demonstration launcher, 15:22035 (R;US)
A linear filtering technique for removal of low-frequency noise, 15:22481 (R;US)
A scheme for running batch jobs interactively from menu-driven INGRES programs, 15:23227 (R;US)
A simple multicomponent fluid theory with accurate physics, 15:22875 (R;US)
A view for security: Thermal imagers, 15:22275 (R;US)
An object-oriented environment for robot system architectures, 15:22263 (R;US)
Analysis of shell-rupture failure due to hypothetical elevated-temperature pressurization of the Sequoyah Unit 1 steel containment building, 15:21847 (R;US)
Analysis of software for security-critical systems, 15:23200 (R;US)
Boundary equations of configuration obstacles for manipulators, 15:22265 (R;US)
CCST [Center for Compound Semiconductor Technology] Research Briefs: Volume 1, Number 1, 15:22184 (R;US)
Components of an overall performance assessment methodology, 15:21511 (R;US)
Description, operation, and maintenance information on joystick and closed-circuit television MPS-36 radar, Meppen Range, Federal Republic of Germany: Technical manual, 15:22329 (R;US)
Design and performance of a multi-stage cylindrical reconnection launcher, 15:22036 (R;US)
Designing an experimenters database using the Nijssen Information Analysis Methodology (NIAM), 15:23147 (R;US)
Developments in solar photocatalysis for destruction of organics in water, 15:21620 (R;US)
Diagnostics and firing control for the cylindrical reconnection launcher, 15:22037 (R;US)
Dynamic damping control: Implementation issues and simulation results, 15:22264 (R;US)
Estimation of modeled object pose from monocular images, 15:22268 (R;US)
Evaluation of material homogeniety as a function of thickness of low-alloy ferritic steel: Final report, 15:22128 (R;US)
Exploratory battery technology development and testing report for 1988, 15:21884 (R;US)
Exploratory development of the reconnection launcher, 1986–1990, 15:22038 (R;US)
High temperature chemistry of oxide superconductors, 15:22127 (R;US)
High-efficiency silicon concentrator solar cell research, 15:21621 (R;US)
Hydrous metal oxide-supported catalysts: Part 1, Preparation chemistry and physical and chemical properties, 15:21140 (R;US)
Identification of defects in SOI [silicon-on-insulator] wafers, 15:22186 (R;US)
Knowledge-based robotic grasping, 15:22260 (R;US)
Melt progression, oxidation, and natural convection in a severely damaged reactor core, 15:21845 (R;US)
Moisture control in sealed electronic packages, 15:22261 (R;US)
On the classification of ideal secret sharing schemes, 15:23228 (R;US)
Parameter-scheduled trajectory planning for suppression of coupled horizontal and vertical vibrations in a flexible rod, 15:22267 (R;US)
PC-based information systems used in planning and coordinating the Building 823 exclusion from Tech Area 1, 15:23199 (R;US)
Posttest analysis of a 1:6-scale reinforced concrete reactor containment building, 15:21848 (R;US)
Pyrotechnic device technology, 15:22470 (R;US)
Resolved motion rate and resolved acceleration servo-control of wheeled mobile robots, 15:22262 (R;US)
RIPE: An object-oriented Robot Independent Programming Environment, 15:23229 (R;US)
Sandia Technology: Volume 14, No. 1, 15:21915 (R;US)
Seismic data processing using digital signal analysis techniques, 15:22480 (R;US)
SiO_x precipitation: Defect density correlation with the n^+ substrate resistivity, 15:22185 (R;US)
Strategies for high efficiency operation of the E-beam excited atomic xenon laser using high-power and high-energy loading, 15:22331 (R;US)
Subsurface TE scattering by tunnels using a surface line current, 15:22795 (R;US)
Swing-free movement of simply suspended objects employing parameter estimation, 15:22266 (R;US)

The adaptive line enhancer applied to chirp detection, 15:22332 (R;US)
The long-term measurement of strong-motion earthquakes offshore southern California, 15:21205 (R;US)
The viscoelasticity of curing thermosets, 15:22187 (R;US)
WARP-10: A numerical simulation model for the cylindrical reconnection launcher, 15:22330 (R;US)

Sandia National Labs., Livermore, CA (USA)
1988 Annual site environmental report, Sandia National Laboratories, Livermore, California, 15:22539 (R;US)

Sargent and Lundy, Chicago, IL (USA)
R&D plans for advanced computer and control technologies: Volume 3, Expert-systems technology assessment: Final report, 15:21656 (R;US)

Saskoil-Saskatchewan Oil and Gas Corp., Regina, SK (Canada)
Saskoil annual report 1986, 15:21326 (R;CA)

Savannah River Lab., Aiken, SC (USA)
A differential thermal analysis study of the effect of tramp impurities on the exothermic U_3O_8-Al reactions, 15:21449 (R;US)
Re-evaluation of $BOSF_N$ limits, 15:21792 (R;US)

Science Applications International Corp., Albuquerque, NM (USA)
Components of an overall performance assessment methodology, 15:21511 (R;US)

Science Applications International Corp., San Diego, CA (USA)
R and D plans for advanced computer and control technologies: Volume 4, Process integration and information systems for fossil plant automation: Technology assessment; Final report, 15:21657 (R;US)
R&D plans for advanced computer and control technologies: Volume 2, Instrumentation and control systems: Final report, 15:21655 (R;US)
R&D plans for advanced computer and control technologies: Volume 3, Expert-systems technology assessment: Final report, 15:21656 (R;US)

Science Applications International Corp., Torrance, CA (USA)
STARRS-MMS [Secondary side Transport And Retention of Radioactive Species-modular modeling system] code: Evaluating steam generator tube ruptures: Volume 3, Users manual, Final report, 15:21742 (R;US)
STARRS-MMS [Secondary-Side Transport And Retention of Radioactive Species-Modular Modeling System] code: Evaluating steam generator tube ruptures: Volume 2: Programmer's manual, Final report, 15:21741 (R;US)
STARRS-MMS [Secondary-Side Transport And Retention of Radioactive Species-Modular Modeling System] code: Evaluating steam generator tube ruptures: Volume 4: Application, Final report, 15:21798 (R;US)

SCIENTECH, Inc., Boise, ID (USA)
An assessment of criticality safety at the Department of Energy Rocky Flats Plant, Golden, Colorado, July–September 1989, 15:21448 (R;US)

Sheridan Technical Associates, Inc., Oakville, ON (Canada)
Deasphalting of non-conventional residues and catalytic cracking of de-asphated oils by metal-tolerant catalyst (Part of the Program of the Federal Panel on Energy R & D [PERD]): Task 8 DA and FCC process modelling. Final report, 15:21424 (R;CA)
Deasphalting of non-conventional residues and catalytic cracking of de-asphalted oils by metal-tolerant catalyst: Final report, 15:21425 (R;CA)

Societe Electrique de l'Our S.A., Luxembourg (Luxembourg)
Compressed-air energy storage using hard-rock geology: Test facility and results: Volume 2, Evaluation of test results: Final report, 15:21876 (R;US)

Solar Energy Research Inst., Golden, CO (USA)
Assessment of biobased materials, 15:22188 (R;US)
$CuInSe_2$ and CdTe: Scale-up for manufacturing, 15:21622 (R;US)
Energy storage and distribution program summary: Volume 1, Overview, fiscal year 1989, 15:21937 (R;US)
Health, safety and environmental issues relating to cadmium usage in photovoltaic energy systems, 15:21627 (R;US)
PC-based PCM telemetry data reduction system software, 15:21652 (R;US)
Photovoltaic energy program summary: Volume 1, Overview, fiscal year 1989, 15:21614 (R;US)
Solar buildings program summary, fiscal year 1989: Volume 1, Overview, 15:21625 (R;US)
Solar thermal program summary, fiscal year 1989: Volume 1, Overview, 15:21610 (R;US)
Spectral solar radiation data base documentation: Volume 1, 15:21611 (R;US)

Southern California Edison Co., Rosemead, CA (USA)
Utility industry evaluation of the Sodium Advanced Fast Reactor: Final report, 15:21795 (R;US)
Utility industry evaluation of the Power Reactor Inherently Safe Module: Final report, 15:21796 (R;US)
Utility industry evaluation of the metal fuel facility and metal fuel performance for liquid metal reactors: Final report, 15:21797 (R;US)

Southern Research Inst., Birmingham, AL (USA)
An investigation of precipitator wide plate spacing: Final report, 15:21661 (R;US)
Electrostatic precipitation of condensed acid mist: Phase 1, Final report, September 1988–September 1989, 15:21660 (R;US)

Southwest Research Inst., San Antonio, TX (USA)
Cumulative airport noise-exposure metrics: An assessment of evidence for time-of-day weightings. Revision, 15:22779 (R;US)

SRI International, Menlo Park, CA (USA)
Sodium/sulfur battery: Supporting R and D on sulfur-side components: Final report, 15:21879 (R;US)

Stanford Linear Accelerator Center, Menlo Park, CA (USA)
A finite Zitterbewegung model for relativistic quantum mechanics, 15:22980 (R;US)
Exploiting VM/XA, 15:22399 (R;US)
Improving reliability in the SLC [Stanford Linear Collider] control system, 15:22398 (R;US)
Prospects for next-generation e^+e^- linear colliders, 15:22362 (R;US)
Sector 30 collimator radiation, 15:22397 (R;US)

Stanford Univ., CA (USA)
Shear-induced inflation of coronal magnetic fields, 15:22821 (R;US)

Stanford Univ., CA (USA). Dept. of Electrical Engineering
Construct a linac/storage ring FEL facility. Final report, 15 December 1983-14 July 1988, 15:22269 (R;US)

State Univ. of New York, Albany, NY (USA). Research Foundation
X ray microimaging by diffractive techniques: Progress report, 15:22381 (R;US)

Stone and Webster Engineering Corp., Boston, MA (USA)
Fish protection systems for hydro plants: Test results, 15:21607 (R;US)

Strasbourg-1 Univ., 67 (France)
High spin levels populated in multinucleon transfer reaction with 480 MeV ^{12}C, 15:22933 (R;FR)
Introduction to strings and superstrings, 15:22904 (R;FR;In French)

Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires
Characterisation of the light pulses of a cavity dumped dye laser pumped by a cw mode-locked and q-switched Nd:YAG laser, 15:22428 (R;FR;In French)
High spin levels populated in multinucleon transfer reaction with 480 MeV ^{12}C, 15:22933 (R;FR)
Intramolecular charge-transfer fluorescence of a new class of sterically hindered bichromophoric molecules, 15:22220 (R;FR)
Introduction to strings and superstrings, 15:22904 (R;FR;In French)
Origin of the voltage breakdowns in electrostatic particle accelerators, 15:22358 (R;FR)
Photophysics of internal twisting, 15:22219 (R;FR)

Sverdrup Technology, Inc., Cleveland, OH (USA)
Development and characterization of PdCr temperature-compensaated wire resistance strain gage, 15:22463 (R;US)

Systems Control, Power Automation, Inc., Palo Alto, CA (USA)
R and D plans for advanced computer and control technologies: Volume 4, Process integration and information systems for fossil plant automation: Technology assessment; Final report, 15:21657 (R;US)

T

Tanzania Forestry Research Inst., Moshi (Tanzania). Timber Utilization Research Centre
Charcoal production in Tanzania using improved traditional earth kilns, 15:21585 (R;CA)

TECHNE, Rome (Italy)
Economics of energy sources: Data management and information system, 15:23248 (R;IT;In Italian)

Technische Hochschule Aachen (Germany, F.R.)
Measurement of double differential production cross sections for charged particles for the validation of theoretical models used to describe interactions of high energy protons with matter, 15:22885 (R;DE;In German)

Technische Hochschule Aachen (Germany, F.R.). Fakultaet fuer Bergbau und Huettenwesen
Irreversible thermodynamics models and constitutive equations of the irradiation induced deformation and damage accumulating processes, 15:22117 (R;DE;In German)

Technische Hogeschool Delft (Netherlands). Dept. of Sanitary Engineering and Water Management
Leaching of heavy metals from thermally decontaminated soils, 15:22553 (R;NL)

Technische Univ. Delft (Netherlands)
A new gamma camera for positron emission tomography, 15:22439 (R;NL)

Technische Univ. Eindhoven (Netherlands)
Crystallographic and magnetic properties of $(C_6D_{11}ND_3)CuBr_3$ and $(Zn_{1-x}Mn_x)_3As_2$: A neutron scattering study, 15:22173 (R;NL)

Technische Univ. Muenchen, Garching (Germany, F.R.). Inst. fuer Radiochemie
Thermodynamics and speciation: Solubility of PuO_2 and $Pu(OH)_4$ and electrophoretic speciation of Np ions. Progress report for the CEC project MIRAGE II, 15:22236 (R;DE)

Technische Univ. Twente, Enschede (Netherlands)
Evaluation of the system of licences and the registration of radioactive materials of the Dutch Nuclear power law: Final report, 15:21716 (R;NL;In Dutch)

Technischer Ueberwachungs-Verein Rheinland e.V., Koeln (Germany, F.R.)
Studies on the controllability of sampling concepts for ultrasonic testing of welds in nuclear engineering, 15:22279 (R;DE;In German)

Teledyne Brown Engineering, Huntsville, AL (USA)
Weldability and microstructural analysis of nuclear-grade austenitic stainless steels, 15:22133 (D;US)

Teledyne Continental Motors, Mobile, AL (USA). Aircraft Products Div.
Development of small gas-turbine-based steam cogeneration system. Phase 1. Final report, July 1987-December 1988, 15:22074 (R;US)

Teledyne Geotech, Alexandria, VA (USA). Alexandria Labs.
Comparison of the spectral characteristics of nuclear explosions detonated below and above the water table. Report for March 1988-February 1989, 15:22479 (R;US)

Tennessee Valley Authority, Knoxville, TN (USA)
Utility industry evaluation of the Sodium Advanced Fast Reactor: Final report, 15:21795 (R;US)
Utility industry evaluation of the Power Reactor Inherently Safe Module: Final report, 15:21796 (R;US)
Utility industry evaluation of the metal fuel facility and metal fuel performance for liquid metal reactors: Final report, 15:21797 (R;US)

TES Ltd., Ottawa, ON (Canada)
Prospecting site technical summary for 1987/88, 15:21653 (R;CA)

Texas A and M Univ., College Station, TX (USA)
A search for neutrons and gamma rays associated with tritium production in deuterated metals, 15:22982 (R;US)
Modern biofuel cells for waste recycling in life support systems. Final report, 15:21957 (R;US)

Texas A and M Univ., College Station, TX (USA). Research Foundation
Calorimeter measurements in relativistic heavy-ion research: Progress in research, 15:22915 (R;US)
Considerations of beta and electron transport in internal dose calculations: Progress report, 15:22952 (R;US)
Evaluation of material homogeniety as a function of thickness of low-alloy ferritic steel: Final report, 15:22128 (R;US)

Texas Univ., Austin, TX (USA)
Analysis of coordinated observations of a giant stellar flare. Final Technical report, 1 March 1988-31 August 1989, 15:22820 (R;US)

Texas Univ., Austin, TX (USA). Dept. of Petroleum Engineering
Modelling and scale-up of chemical flooding: Third annual and Final report for the period October 1987–September 1988, 15:21286 (R;US)

Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study
CAMAC memory module: MEMO-32, 15:22392 (R;JP;In Japanese)
Liquid-^{4}He target with a small refrigerator, 15:22391 (R;JP)

Transalta Utilities Corp., Calgary, AB (Canada)
Classification of Canadian coals using pilot plant pressurized gasifier [part of the program of the Federal Panel on Energy R&D (PERD)]: Final report, 15:21141 (R;CA)

Transport Canada, Ottawa, ON (Canada). Marine Casualty Investigations
Report of investigation into the circumstances attending the striking of East Outer Channel light structure number 1, in the American section of Lake Erie by the Canadian tanker "Enerchem Refiner", October 5, 1988., 15:21338 (R;CA)
Report of investigation into the circumstances attending the striking of East Outer Channel light structure number 1, in the American section of Lake Erie by the Candadian tanker "Enerchem Refiner", October 5, 1988, 15:21339 (R;CA)

TRW Space and Technology Group, Redondo Beach, CA (USA)
Nonlinear optics technology. Phase 2. Area 1. Four-wave-mixing technology. Area 2. Phase conjugated solid state laser technology. Final report, September 1986-January 1988, 15:22315 (R;US)

U

UKAEA Culham Lab., Abingdon (UK)
A neutron activation, transmutation and dose rate benchmark study, 15:22932 (R;GB)
Concentrations of radiologically-important tramp elements in standard-grade stainless steels with particular relevance to activation of the first wall of NET, 15:23105 (R;GB)

UKAEA Harwell Lab. (UK). Environmental and Medical Science Div.
Health Physics, Safety and Medical Services report for 1988, 15:23197 (R;GB)
The distribution and uptake of rare-earth elements in the food chain and their use as analogues for the transuranic elements: A literature review, 15:22742 (R;GB)

UKAEA Springfields Nuclear Power Development Labs. (UK)
A review of irradiation induced creep in graphite under CAGR conditions, 15:22183 (R;GB)

Liquefied Gaseous Fuels Spill Test Facility program: Eleven additional chemicals: Environmental Assessment, 15:22767 (R;US)

USDOE Assistant Secretary for Fossil Energy, Washington, DC (USA). Office of Petroleum Reserves
Strategic Petroleum Reserve annual/quarterly report, 15:21932 (R;US)

USDOE Bonneville Power Administration, Portland, OR (USA)
Draft 1990 Resource Program technical report, 15:21934 (R;US)
Draft global warming study: Draft 1990 Resource Program, 15:21602 (R;US)
Draft Resource Acquisition Approaches Plan: Supplement to draft 1990 resource program technical report, 15:21936 (R;US)
Modular housing case study: Residential Construction Demonstration Project, 15:21965 (R;US)

USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Fish and Wildlife
Protection of wild adult steelhead in Idaho by adipose fin removal: Five year completion report: Final report, 15:21604 (R;US)
Yakima River spring chinook enhancement study: Annual report FY 1988, 15:21605 (R;US)

USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Resource Management
Northwest residential infiltration study: Volume 1, Analysis and results, 15:21966 (R;US)
Northwest residential infiltration study: Volume 2, Sample selection and bias assessment, 15:21967 (R;US)

USDOE Bonneville Power Administration, Portland, OR (USA). Office of Energy Resources
Final radon testing results for the Residential Standards Demonstration Progam, 15:21963 (R;US)

USDOE Bonneville Power Administration, Yakima, WA (USA)
Velocity measurements at six fish screening facilities in the Yakima River Basin: Annual report, 1988, 15:21603 (R;US)

USDOE Energy Information Administration, Washington, DC (USA)
Energy Information Administration annual report to Congress, 1989, 15:21923 (R;US)

USDOE Energy Information Administration, Washington, DC (USA). Office of Coal, Nuclear, Electric and Alternate Fuels
Financial statistics of selected electric utilities, 1988, 15:21938 (R;US)

USDOE Energy Information Administration, Washington, DC (USA). Office of Energy Markets and End Use
Household vehicles energy consumption, 1988, 15:22032 (R;US)
PC-AEO forecasting model for the Annual Energy Outlook 1990: Model documentation, 15:21887 (R;US)

USDOE Energy Information Administration, Washington, DC (USA). Office of Oil and Gas
International oil and gas exploration and development activities: Quarterly report, third quarter 1989, 15:21321 (R;US)
Natural gas monthly, December 1989, 15:21365 (R;US)
Petroleum Marketing Monthly, December 1989, 15:21320 (R;US)
Petroleum Supply Monthly, December 1989, 15:21319 (R;US)

USDOE Morgantown Energy Technology Center, WV (USA)
Proceedings of the ninth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1, 15:21123 (R;US)
Proceedings of the ninth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2, 15:21124 (R;US)

USDOE Nevada Operations Office, Las Vegas, NV (USA)
Tunnel Review Executive Committee report of programs conducted in the Nevada Test Site tunnel complex, 15:22475 (R;US)

USDOE Nevada Operations Office, Las Vegas, NV (USA). Yucca Mountain Project Office
Yucca Mountain Project technical status report, April–September 1989, 15:21513 (R;US)

USDOE Office of Civilian Radioactive Waste Management, Washington, DC (USA)
OCRWM [Office of Civilian Radioactive Waste Management] System Engineering Management Plant (SEMP), 15:21480 (R;US)

USDOE Office of Energy Research, Washington, DC (USA). Atmospheric and Climate Research Div.
Atmospheric Radiation Measurement Program Plan, 15:22498 (R;US)
Atmospheric Radiation Measurement Program plan: Executive Summary, 15:22499 (R;US)

USDOE Office of Energy Research, Washington, DC (USA). Office of Program Analysis
Summary results of an assessment of research projects in the Chemical Toxicology Research Program, 15:22768 (R;US)

USDOE Office of Environment, Washington, DC (USA). Office of New Production Reactors
Assurance for the future, 15:21785 (R;US)
Implementation plan for the new production reactor capacity environmental impact statement, 15:22544 (R;US)

USDOE Richland Operations Office, WA (USA)
Defense Decontamination and Decommissioning Program: Program management plan, 15:21475 (R;US)
Request for interim approval to operate 218-E-12B Trench 94 as a chemical waste landfill for disposal of polychlorinated biphenyl wastes in submarine reactor compartments, 15:21476 (R;US)

USDOE, Washington, DC (USA)
AISI [American Iron and Steel Institute] direct steelmaking program annual technical report for year ending November 29, 1989, 15:22108 (R;US)

Utah Univ., Salt Lake City, UT (USA)
Coal surface control for advanced fine coal flotation: Quarterly report No. 5, October 1, 1989–December 31, 1989, 15:21147 (R;US)
Theoretical and experimental study of solid phase miscibility gaps in III/V quaternary alloys: Progress report, April 1, 1987–June 2, 1989, 15:22105 (R;US)

Utility Resource Associates, Rockville, MD (USA)
Evaluation of discrepancies in assembly cross-section generator codes: Volume 3, Assembly calculations: Final report, 15:21794 (R;US)

V

Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)
Estimation of some stochastic models used in reliability engineering, 15:21727 (R;FI)
Nuclear fuel materials research project, 15:22095 (R;FI;In Finnish)
Probabilistic trajectory and dose analysis for Finland due to hypothetical radioactive releases at Sosnovyy Bor, 15:21745 (R;FI)

Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (USA)
Enzymology of acetone-butanol-isopropanol formation: Progress report, February 1, 1989–January 31, 1990, 15:22712 (R;US)

Virginia Univ., Charlottesville, VA (USA)
Angular-momentum limitations in heavy ion-induced fusion reactions leading to ^{40}Ca and ^{42}Ca, 15:22983 (D;US)

Virginia Univ., Charlottesville, VA (USA). Dept. of Computer Science
Analysis of compact 0-complete trees: A new access method to large databases, 15:23249 (R;US)
Implementation of a hypercube database system: Annual report, March 1989–February 1990, 15:23250 (R;US)

Voimayhtioeiden Ydinjaetetoimikunta, Helsinki (Finland)
Activity inventory of the activated decommissioning waste in the Olkiluoto nuclear power plant, 15:21851 (R;FI)
Half-scale solidification experiment of spent ion exchange resins, 15:21535 (R;FI;In Finnish)
Sorption and diffusion of radionuclides (C, Tc, U, Pu, Np) in rock samples under oxic and anoxic conditions, 15:21536 (R;FI)

Voorlopige Commissie voor de Milieu-effectrapportage, Utrecht (Netherlands)
Examination advice of the location-independent environmental-impact report and advice-direction guides for the location-dependent environmental-impact report concerning storage and processing of radiactive waste, 15:21529 (R;NL;In Dutch)

Vrije Univ., Amsterdam (Netherlands)
Ground-state correlations in ^{12}C and the mechanism of the (e,e'p) reaction, 15:22923 (R;NL)
Stark effect in Rydberg states of helium and barium, 15:22853 (R;NL)

W

Washington State Energy Office, Olympia, WA (USA)
Modular housing case study: Residential Construction Demonstration Project, 15:21965 (R;US)

Water and Earth Science Associates Ltd., Carp, ON (Canada)
Low cost treatment technology for gasoline contaminated groundwater-Delta, Ontario, 15:21331 (R;CA)

Waterloo Univ., ON (Canada). Dept. of Chemical Engineering
Assessment of Waterloo flash pyrolysis process to obtain liquid fuels from Canadian peat, 15:21142 (R;CA)
Chemicals and fuels from biomass flash pyrolysis- part of the Bioenergy Development Program (BDP), 15:21586 (R;CA)
Effect of pressure and temperature on the surface tension and viscosity: Final report, 15:21304 (R;CA)

Wattsun Corp., Albuquerque, NM (USA)
Design optimization of short focal length photovoltaic modules: Final technical report, 15:21619 (R;US)

Webb (R.F.) Corp. Ltd., Ottawa, ON (Canada)
Executive and technical summary report on propane bus demonstration-Ottawa-Carleton Regional Transit Commission, 15:22089 (R;CA)
Hamilton Street Railway compressed natural gas bus demonstration project: Final report on phases 1-3, 15:22088 (R;CA)

West Virginia Geological and Economic Survey, Morgantown, WV (USA)
Analysis of Devonian shale stratigraphic, production, and completion data in West Virginia. Final report, July 1, 1984-July 31, 1988, 15:21355 (R;US)

West Virginia Univ., Morgantown, WV (USA). Dept. of Mechanical and Aerospace Engineering
A study of coal particle shape and three-body wear: Quarterly report, November 1989–January 1990, 15:21148 (R;US)

Westinghouse Electric Corp., Carlsbad, NM (USA). Waste Isolation Div.
Neutron shielding analysis for remote handled transuranic waste containers in facility casks at the Waste Isolation Pilot Plant, 15:21530 (R;US)

Westinghouse Hanford Co., Richland, WA (USA)
Comparison of transmission and reflection Fourier transform infrared methods for the analysis of cement blends, 15:21533 (R;US)
Groudwater maps of the Hanford Site Separations Area, June 1989, 15:21531 (R;US)
Low-level burial grounds database, 15:21532 (R;US)
Resource conservation and recovery act activities for treatment, storage, and/or disposal units operating at the Hanford Site, 15:21534 (R;US)

Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (USA)
ICPP [Idaho Chemical Processing Plant] environmental monitoring report, CY-1988, 15:22585 (R;US)

Westinghouse Materials Co. of Ohio, Cincinnati, OH (USA). Feed Materials Production Center
Biological and ecological site characterization of the Feed Materials Production Center, June 1986–June 1987, 15:21542 (R;US)
Feed Materials Production Center environmental monitoring annual report for 1988, 15:21541 (R;US)

Westinghouse Savannah River Co., Aiken, SC (USA)
Data banks for risk assessment at the Savannah River Site, 15:21547 (R;US)
Properties of U_3O_8-aluminum cermet fuel, 15:21451 (R;US)
Reactions during the processing of U_3O_8-Al cermet fuels, 15:21441 (R;US)
Transaction processing in a quality control laboratory, 15:21444 (R;US)

Wisconsin Electric Power Co., Milwaukee, WI (USA)
Utility industry evaluation of the Sodium Advanced Fast Reactor: Final report, 15:21795 (R;US)
Utility industry evaluation of the Power Reactor Inherently Safe Module: Final report, 15:21796 (R;US)
Utility industry evaluation of the metal fuel facility and metal fuel performance for liquid metal reactors: Final report, 15:21797 (R;US)

Wisconsin Univ., Madison, WI (USA)
[Molecular mechanism of energy transduction by plant membrane proteins]: Progress report, June 15, 1983–June 15, 1984, 15:22711 (R;US)

Wisconsin Univ., Madison, WI (USA). Dept. of Nuclear Engineering and Engineering Physics
[Design of D-^{3}He commercial tokamak], 15:23110 (R;US)

Y

Yakima Indian Nation, WA (USA). Fisheries Resource Management
Yakima River spring chinook enhancement study: Annual report FY 1988, 15:21605 (R;US)

Yuill (G.K.) and Associates Ltd., Winnipeg, MB (Canada)
Development of a computer model to predict overheating in passive solar houses, 15:21973 (R;CA)

Personal Author Index

Authors' surnames are indexed in the form appearing in the publication cited; given names generally have been reduced to initials. For documents with multiple authors, each author name is indexed. The entry for a primary author (first author listed on an abstracted document) includes the full document title and citation number. Entries for other authors provide a cross-reference to the primary author. Also included is information on the document type, country of publication, and the document language listed in parentheses in the format (J;FR;In French and English). Accent marks are not input because of computer alphabetization. Spelling and transliteration follow standard conventions.

Subject Index

This index is arranged by subject descriptors selected from those assigned to each citation in this publication. Subject descriptors are selected from a controlled thesaurus of terms, *EDB Subject Thesaurus* (DOE/OSTI-7000). In order to enhance indexing, subject descriptor entries generally consist of a pair of descriptors: a main term and a qualifier term. Each entry includes the full title (which may be followed by supplementary descriptive information in parentheses) and the citation number. Additional information given in parentheses indicates the document type (an abbreviation such as B for book), the country of publication (such as DE for Federal Republic of Germany), and the language if non-English.

See references guide users from synonymous terms to the descriptors selected for the concept. *See also* references indicate subject concepts that are more specific than a particular descriptor. To gain complete subject coverage, all such terms should be reviewed.

A

A CODES
Area Over Length (AOL): A program for the calculation of effective two-dimensional thermal conductance through an arbitrarily shaped region, 15:22978 (R;US)

A-BOMB SURVIVORS
Activation of cobalt by neutrons from the Hiroshima bomb, 15:22760 (R;US)

ABANDONED SITES
Ground-water contamination at an inactive coal- and oil-gasification plant site, Gas Works Park, Seattle, Washington. Water-resources investigations, 15:22611 (R;US)

ABSORBED DOSES
See RADIATION DOSES

ABSORBED FRACTION (INTERNAL IRRADIATION)
See INTERNAL IRRADIATION

ABSORPTION SPECTROSCOPY
Behavior of NH_3 in coal derived gas (Part 1). Continuous ammonia analyzer for coal derived gas, 15:21121 (R;JP;In Japanese)

ACCELERATORS

LINEAR ACCELERATORS
PARTICLE BEAM FUSION ACCELERATOR
RAILGUN ACCELERATORS
A high-voltage multistage laser-triggered gas switch, 15:22350 (BA;US)
A multi-megavolt, two-microsecond electron beam diode, 15:22413 (BA;US)
Alignment of the Hermes-III magnetically insulated transmission line, 15:22418 (BA;US)
Final focusing of Z-discharge transported ion beams, 15:23170 (BA;US)
High efficiency 1.7 GHz gyropeniotron amplifier, 15:23180 (BA;US)
Indented-anode diode for Hermes III, 15:22414 (BA;US)
Laser trigger system for the Hermes-III accelerator, 15:22353 (BA;US)
Proceedings of the workshop on role of plasmas in accelerators, 15:23055 (R;JP)
Pulsed power safety and technical training at Sandia National Laboratories, 15:22407 (BA;US)
RADLAC-II module accelerator development for double pulse injector operation, 15:22365 (BA;US)
Testing of the inductive cores for Hermes III, 15:22416 (BA;US)
The Hermes-III program, 15:22410 (BA;US)
The application of system identification techniques to an R.F. Cavity tuning loop, 15:22361 (R;GB)
Troll: A 4-MV peak voltage pulser, 15:22411 (BA;US)

ACCIDENTAL INTAKE
See ACCIDENTS

ACCIDENTAL IRRADIATION
See RADIATION ACCIDENTS

ACCIDENTS
See also RADIATION ACCIDENTS
REACTOR ACCIDENTS
Environmental protection for hazardous materials incidents, 15:22783 (R;US)
Melt progression, oxidation, and natural convection in a severely damaged reactor core, 15:21845 (R;US)
Report of investigation into the circumstances attending the striking of East Outer Channel light structure number 1, in the American section of Lake Erie by the Candadian tanker "Enerchem Refiner", October 5, 1988, 15:21339 (R;CA)
Report of investigation into the circumstances attending the striking of East Outer Channel light structure number 1, in the American section of Lake Erie by the Canadian tanker "Enerchem Refiner", October 5, 1988., 15:21338 (R;CA)

ACCUMULATION (RADIOECOLOGICAL)
See RADIOECOLOGICAL CONCENTRATION

ACES
See QUARKS

ACETYLENE
Identification and temporal behavior of radical intermediates formed during the combustion and pyrolysis of gaseous fuels: Kinetic pathways to soot formation: Progress report, July 1, 1989–June 30, 1990, 15:22240 (R;US)

ACID RAIN
Computational solution of chemistry problems. Final report, period ending 30 June 1988, 15:22508 (R;US)
Development of the National Acid Precipitation Assessment Program (NAPAP) Anthropogenic Emission Inventory, 1985: Annual area source emissions, Version 1. Data file, 15:22532 (R;US)
Development of the National Acid Precipitation Assessment Program (NAPAP) Anthropogenic Emissions Inventory, 1985: Annual area source county level fuel use and activity levels, Version 1. Data file, 15:22531 (R;US)
Development of the National Acid Precipitation Assessment Program (NAPAP) Anthropogenic Emissions Inventory, 1985: Annual point sources, Version 1. Data file, 15:22530 (R;US)
Development of the National Acid Precipitation Assessment Program (NAPAP) National Utility Reference File (NURF) emissions inventory, 1985, Version 2 (for microcomputers). Data file, 15:21666 (R;US)
Development of the National Acid Precipitation Assessment Program (NAPAP) National Utility Reference File (NURF) emissions inventory, 1985, Version 2. Data file, 15:22533 (R;US)
Distribution and variability of precipitation chemistry in the conterminous United States, January through December 1983. Open file report, 15:22525 (R;US)
NAPAP (National Acid Precipitation Assessment Program) emissions inventory (version 2): Development of the national utility reference file, 1985. Final report, January-September 1989, 15:22524 (R;US)

ACIDIFICATION
Biological effects of changes in surface water acid-base chemistry: State-of-Science/Technology report 13, 15:22607 (R;US)

ACOUSTICS
Acoustically enhanced combustion of micronized coal water slurry fuel: Final report, 15:21167 (R;US)

ACQUISITION (DATA)
See DATA ACQUISITION

ACTH
The influence of chosen parameters of iodine-125 produced by IPRC on iodination of adrenocorticotropic hormone (ACTH): The comparison of Nasup 125I preparations produced by three different technological methods, 15:22232 (R;PL;In Polish)

ACTINIDES
See also NEPTUNIUM
PLUTONIUM
THORIUM
URANIUM
Challenges of tomorrow... chemistry, 15:22215 (J;US)

ACTIVATED CARBON
Activated charcoal filters: Water treatment, pollution control, and industrial applications. October 1970-October 1989 (Citations from the US Patent data base). Report for October 1970-October 1989, 15:22705 (R;US)

ADDITIVES
See also FUEL ADDITIVES
Copper oxychloride as a fireside additive in coal-fired utility boilers: Final report, 15:21158 (R;US)
Improvement of the insulation near the interface to semiconducting layer on EHV XLPE cables by an additive, 15:21862 (R;JP;In Japanese)

ADENOSINE TRIPHOSPHATASE
See ATP-ASE

ADIPOSE TISSUE
Dual photon absorptiometry: Validation of mineral and fat measurements, 15:22722 (R;US)

ADOLESCENTS
Follow-up study of persons who had iodine-131 and other diagnostic procedures during childhood and adolescence, 15:22732 (R;US)

ADRENOCORTICOTROPIC HORMONE
See ACTH

ADSORPTION
Modelling of a diffusion-sorption experiment on sandstone, 15:22579 (R;CH)

AEROSOLS
See also RADIOACTIVE AEROSOLS
Air-pollution sampling of particles. February 1981-April 1986 (Citations from the NTIS data base). Report for February 1981-April 1986, 15:22536 (R;US)
Air-pollution sampling of particles. May 1986-January 1990 (Citations from the NTIS data base). Report for May 1986-January 1990, 15:22537 (R;US)

AGE ESTIMATION
Direct dating of Phanerozoic sediments by the ^{238}U-^{206}Pb method, 15:22216 (J;GB)

AGING
Aging studies on materials from the Shippingport reactor, 15:21704 (RA;US)

AIR FILTERS
Activated charcoal filters: Water treatment, pollution control, and industrial applications. October 1970-October 1989 (Citations from the US Patent data base). Report for October 1970-October 1989, 15:22705 (R;US)
Evaluation of emission-control devices at waferboard plants. Final report, 15:22519 (R;US)

AIR HEATERS
Methods for measuring the air heater leakage in a coal fired thermal generating station, 15:21659 (R;CA)
The atmospheric fluidized-bed cogeneration air heater experiment, 15:21177 (BA;US)

AIR INFILTRATION
Mathematical modelling of infiltration and ventilation, 15:22000 (R;US)
The COMIS [Conjunction Of Multizone Infiltration Specialists] infiltration model, 15:22001 (R;US)
The COMIS [Conjunction of Multizone infiltration Specialists] infiltration model, 15:22006 (RA;CA)

AIR POLLUTION
See also INDOOR AIR POLLUTION
Investigation of the determination of respirable quartz on filter media using Fourier transform infrared spectrophotometry, 15:22510 (R;US)
NAPAP (National Acid Precipitation Assessment Program) emissions inventory (version 2): Development of the national utility reference file, 1985. Final report, January-September 1989, 15:22524 (R;US)

Biological Effects
Air pollution-caused changes in photosynthesis: Effects on plant growth and rhizosphere functions: Final report, 15:22500 (R;US)

Contamination
Environmental Radiation Data: Report 53, January-March 1988. Quarterly report, 15:22521 (R;US)
Environmental Radiation Data: Report 54, April-June 1988. Quarterly report, 15:22522 (R;US)

Environmental Exposure
Health assessment for Barceloneta Landfill, Florida Afuefra, Puerto Rico, Region 2. CERCLIS No. PRD98059129. Preliminary report, 15:22688 (R;US)
Health assessment for Burnt Fly Bog National Priorities List Site, Marlboro, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD980504997. Final report, 15:22620 (R;US)
Health assessment for CPS/Madison Industries, Old Bridge Township, Middlesex County, New Jersey, Region 2. CERCLIS No. NJD002141190. Preliminary report, 15:22627 (R;US)
Health assessment for Cosden Chemical Coatings NPL (National Priorities List) site, Beverly, New Jersey, Region 2. CERCLIS No. NJD000565531. Preliminary report, 15:22555 (R;US)
Health assessment for Ge-Moreau, South Glen Falls, New York, Region 2. CERCLIS No. NYD980052335. Final report, 15:22668 (R;US)
Health assessment for Hercules Inc., Gibbstown, Glocester County, New Jersey, Region 2. CERCLIS No. NJD002349058. Preliminary report, 15:22636 (R;US)
Health assessment for Islip Sanitary Landfill, Suffolk County, New York, Region 2. CERCLIS No. NYD980506901. Preliminary report, 15:22658 (R;US)
Health assessment for Juncos Landfill, Juncos, Puerto Rico, Region 2. CERCLIS No. PRD980512362. Final report, 15:22529 (R;US)
Health assessment for Kentucky Avenue Wellfield National Priorities List (NPL) site, Horseheads, Chemung County, New York, Region 2. CERCLIS No. NYD981560428. Final report, 15:22678 (R;US)
Health assessment for Kin-Buc Landfill, Edison Township, New Jersey, Region 2. CERCLIS No. NJD049860836. Final report, 15:22637 (R;US)
Health assessment for Monroe Township Landfill, Monroe, New Jersey, Region 2. CERCLIS No. NJD980505671. Preliminary report, 15:22642 (R;US)
Health assessment for Nascolite Corporation, Millville, New Jersey, Region 2. CERCLIS No. NJD002362705. Final report, 15:22644 (R;US)
Health assessment for Port Washington Landfill, North Hempstead, New York, Region 2. CERCLIS No. NYD980654206. Preliminary report, 15:22703 (R;US)
Health assessment for Rowe Industries, Suffolk County, Sag Harbor, New York, Region 2. CERCLIS No. NYD981486954. Preliminary report, 15:22699 (R;US)
Health assessment for Syosset Landfill, Nassau County, Syosset, New York, Region 2. CERCLIS No. NYD000511360. Preliminary report, 15:22693 (R;US)
Health assessment for US Radium-West Orange, Orange, Essex County, New Jersey, Region 2. CERCLIS No. NJD980654172. Preliminary report, 15:21519 (R;US)
Health assessment for Ventron/Velsicol, Wood-Ridge Borough, Bergen County, New Jersey, Region 2. CERCLIS No. NJD980529879. Preliminary report, 15:22564 (R;US)

Inventories
Development of the National Acid Precipitation Assessment Program (NAPAP) Anthropogenic Emission Inventory, 1985: Annual area source emissions, Version 1. Data file, 15:22532 (R;US)
Development of the National Acid Precipitation Assessment Program (NAPAP) Anthropogenic Emissions Inventory, 1985: Annual point sources, Version 1. Data file, 15:22530 (R;US)
Development of the National Acid Precipitation Assessment Program (NAPAP) National Utility Reference File (NURF) emissions inventory, 1985, Version 2. Data file, 15:22533 (R;US)
NATICH (National Air Toxics Information Clearinghouse) data base report on state, local, and EPA (Environmental Protection Agency) air toxics activities. Interim report, 15:22520 (R;US)
Pollution Regulations
NATICH (National Air Toxics Information Clearinghouse) data base report on state, local, and EPA (Environmental Protection Agency) air toxics activities. Interim report, 15:22520 (R;US)
Regional Analysis
Development of the National Acid Precipitation Assessment Program (NAPAP) Anthropogenic Emissions Inventory, 1985: Annual area source county level fuel use and activity levels, Version 1. Data file, 15:22531 (R;US)
Remedial Action
Health assessment for Combe Fill South Landfill, Morris County, New Jersey, Region 2. CERCLIS No. NJD094966611. Final report, 15:22626 (R;US)
Remote Sensing
Remote sensing applied to environmental-pollution detection and management. July 1987-January 1990 (Citations from the NTIS data base). Report for July 1987-January 1990, 15:22535 (R;US)
Respiratory System Diseases
NIOSH (National Institute for Occupational Safety and Health) testimony on cotton dust before the House Committee on Education and Labor, Subcommittee on Labor Standards, by James A. Merchant, May 16, 1979, 15:22523 (R;US)
Sampling
Air-pollution sampling of particles. February 1981-April 1986 (Citations from the NTIS data base). Report for February 1981-April 1986, 15:22536 (R;US)
Air-pollution sampling of particles. May 1986-January 1990 (Citations from the NTIS data base). Report for May 1986-January 1990, 15:22537 (R;US)
Statistical Data
NATICH (National Air Toxics Information Clearinghouse) data base report on state, local, and EPA (Environmental Protection Agency) air toxics activities. Interim report, 15:22520 (R;US)
Surveys
National air quality and emissions trends report, 1987, 15:22511 (R;US)

AIR POLLUTION ABATEMENT
Alternative fuels to address California air quality issues: Current perspectives, 15:21893 (RA;CA)

AIR POLLUTION CONTROL
Catching our breath: Next steps for reducing urban ozone, 15:22512 (R;US)
Evaluation of emission-control devices at waferboard plants. Final report, 15:22519 (R;US)
Guideline series: Guidance document for residential wood-combustion emission-control measures, 15:21894 (R;US)
Structural changes during the decomposition of calcium hydroxide. Report for October 1988-July 1989, 15:22528 (R;US)

AIR PREHEATERS
See AIR HEATERS

AIR QUALITY
Indoor air quality simulation: IAQPC [Indoor air quality simulator for personal computer], 15:22015 (RA;CA)
National air quality and emissions trends report, 1987, 15:22511 (R;US)

AIR SOURCE HEAT PUMPS
A regional economic comparison of ground-source heat pump systems, 15:21981 (RA;DE)
Direct expansion systems, 15:22048 (RA;DE)
Perspectives of a major air-source heat pump manufacturer, 15:21979 (RA;DE)

AIRBORNE PARTICLES
See PARTICULATES

AIRBORNE PARTICULATES

Ion-beam modification of metals: Mechanical properties and structure. Final report, 15 August 1986-14 August 1989, 15:22097 (R;US)
Mean stress and the exhaustion of fatigue-damage resistance, 15:22122 (R;US)
ALPHA PARTICLES
On the generating function of Poincare plots defining one dimensional perturbed Hamiltonian systems, 15:23021 (R;DE)
ALPHA-BEARING WASTES
Neutron shielding analysis for remote handled transuranic waste containers in facility casks at the Waste Isolation Pilot Plant, 15:21530 (R;US)
PREPP [Process Experimental Pilot Plant] operating experience and status, 15:21488 (R;US)
Potential problems from shipment of high-curie content Contact-Handled Transuranic (CH-TRU) waste to WIPP [Waste Isolation Pilot Plant], 15:21486 (R;US)
Review comments on the report of the Steering Committee on Waste Acceptance Criteria for the Waste Isolation Pilot Plant, 15:21482 (R;US)
ALUMINIA
See ALUMINIUM OXIDES
ALUMINIUM
Extended x-ray absorption fine structure analysis applied to composite materials, 15:22167 (R;US)
Measurement of double differential production cross sections for charged particles for the validation of theoretical models used to describe interactions of high energy protons with matter, 15:22885 (R;DE;In German)
Use of Al XII and Mg XI lines as solar plasma diagnostics, 15:22826 (R;GB)
ALUMINIUM ALLOYS
Advanced tribological coatings for high-specific-strength alloys. Interim report No. 5, 15:22096 (R;US)
Advances and future directions in superplastic materials, 15:22099 (RA;FR)
Corrosion properties of Fe_3Al in H_2S-H_2-H_2O mixtures, 15:21120 (R;US)
Experimental evaluation of new alloy coatings. Final report, November 1986-January 1989, 15:22098 (R;US)
ALUMINIUM ARSENIDE SOLAR CELLS
The photovoltaic properties of an Al In As/InP heterojunctions grown by LPE method. Final technical report, 15:21617 (R;US)
ALUMINIUM CARBIDES
Advances and future directions in superplastic materials, 15:22099 (RA;FR)
ALUMINIUM NITRIDES
Determination of impurities in fine ceramics by inductively coupled plasma atomic emission spectrometry, 15:22155 (R;JP)
Optical diagnostics for a high power, RF-inductively coupled plasma, 15:22159 (BA;US)
ALUMINIUM OXIDES
Advances and future directions in superplastic materials, 15:22099 (RA;FR)
Alternative materials for solid oxide fuel cells, 15:21959 (R;US)
Development of ceramic membranes for gas separation: FY 1989 development activities, 15:21133 (R;US)
Preparation, sintering and thermal expansion of $MgAl_2O_4$, 15:22149 (RA;DE)
Thermophysical properties of $MgAl_2O_4$, 15:22148 (RA;DE)

Center of excellence in theoretical geoplasma research. Final report, 1 October 1986-30 September 1989, 15:22839 (R;US)

AUSTENITIC STEELS
See also STEEL-CR15NI15MOTIB
STEEL-CR16NI13MONBV
STEEL-CR16NI16MONB

STEEL-CR17NI12MO3
STEEL-CR17NI12MO3-L
STEEL-CR18NI11
Environmentally assisted cracking in light water reactors, 15:21830 (RA;US)
Tensile behavior and swelling of ternary austenitic alloys irradiated in different neutron spectra, 15:23142 (R;US)

AUTOIONIZATION
Production of autoionizing di-excited states at high angular momentum in Barium collisions with Xenon, 15:22849 (R;FR;In French)

AUTOMATION
Development of automatic control system of CDQ operation, 15:21130 (RA;JP;In Japanese)

AUTOMOTIVE FUELS
15 years of alternative fuels: Reflections, observations and predictions, 15:22085 (RA;CA)
Alternative fuels to address California air quality issues: Current perspectives, 15:21893 (RA;CA)
Automobile air pollution: Automotive fuels. August 1970-January 1990 (Citations from the NTIS data base). Report for August 1970-January 1990, 15:22083 (R;US)
CRC (Coordinating Research Council) octane number requirement survey, 1988, 15:21306 (R;US)
Hydrogen storage: Storage as a gas or liquid. January 1974-December 1989 (Citations from the NTIS data base). Report for January 1974-December 1989, 15:21573 (R;US)

AUTONOMIC NERVOUS SYSTEM AGENTS
Effect of anticholinesterase agents on airway epithelial function. Annual report, 15 July 1888-14 August 1989, 15:22487 (R;US)

AUXILIARY WATER SYSTEMS
Aging assessment of PWR auxiliary feedwater systems, 15:21817 (RA;US)

AVIATION FUELS
US Navy mobility fuels: Worldwide survey and analysis of both commercial and Navy fuels. Final report, 15:21305 (R;US)

AZIDES
Plasma breakdown behavior of hydrogen azide (HN_3) gas mixtures, 15:23084 (BA;US)
Reaction of Tris(cyclopentadienyl)uranium compounds with amines, azides, and related ligands, 15:22235 (R;US)

B

B CODES
FORTRAN programs for basin analysis and petroleum generation modeling, 15:21206 (R;US)
The Beam Break-Up Numerical Simulator, 15:22371 (R;US)

BACKGROUND RADIATION
Environmental radiation data, 7: Background dose rate in and around Tokyo measured with portable instruments, 15:22504 (R;JP;In Japanese)

BALANCE (ENERGY)
See ENERGY BALANCE

BALLISTIC MISSILE DEFENSE
Development of advanced WTA (Weapon Target Assignment) algorithms for parallel processing. Final report, 15:22484 (R;US)
Measurement of the stimulated thermal Rayleigh scattering instability: Revision 1, 15:22486 (R;US)

BALLOONING INSTABILITY
Calculation of the resistive ballooning mode growth rate for a class of 3-D MHD equilibria, 15:23042 (R;DE)
Compressibility and resistive ballooning modes, 15:23043 (R;DE)

BANKS
See COMMERCIAL BUILDINGS

BARIUM
Stark effect in Rydberg states of helium and barium, 15:22853 (R;NL)

BARIUM 126
The effective moment of inertia in ^{124}Xe, ^{126}Ba, ^{128}Ba, ^{129}Ce, ^{131}Ce and ^{162}Er isotopes, 15:22917 (R;FR)

BARIUM 127
The effective moment of inertia in ^{124}Xe, ^{126}Ba, ^{128}Ba, ^{129}Ce, ^{131}Ce and ^{162}Er isotopes, 15:22917 (R;FR)

BARIUM 128
The effective moment of inertia in ^{124}Xe, ^{126}Ba, ^{128}Ba, ^{129}Ce, ^{131}Ce and ^{162}Er isotopes, 15:22917 (R;FR)

BARIUM 147
Decays of ^{147}Ba and ^{147}La using KUR-ISOL, 15:22930 (RA;JP;In Japanese)

BARIUM ISOTOPES
See also BARIUM 126
BARIUM 127
BARIUM 128
BARIUM 147
Study of transitional nuclei at TRISTAN: Progress report, 15:22929 (R;US)

BARIUM OXIDES
Deformation processing of $YBa_2Cu_3O_x$, 15:22140 (R;US)
Polarized x-ray absorption studies of oxide superconductors, 15:22974 (BA;US)
Thermodynamic properties of some metal oxide-zirconia systems, 15:22152 (R;US)

BARYON RESONANCES
See BARYONS

BARYONS
See also NUCLEONS
Big Bang nucleosynthesis and the quark-hadron transition, 15:22819 (R;US)
Electro and photoproduction of strangeness, 15:22881 (R;FR)

BATTERIES (ELECTRIC)
See ELECTRIC BATTERIES

BATTERY SEPARATORS
Battery separators. October 1971-October 1989 (Citations from the US Patent data base). Report for October 1971-October 1989, 15:21882 (R;US)

BCL PROCESS
Japan's Sunshine Project. 1988 Annual summary of coal liquefaction and gasification, 15:21118 (R;JP;In Japanese)
Japan's Sunshine Project. 1988 Annual summary of coal liquefaction and gasification, 15:21119 (R;JP)
Japan's Sunshine Project. 1988 Annual summary of coal liquefaction and gasification, 15:21118 (R;JP;In Japanese)

BEAM BENDING MAGNETS
Computation of synchrotron radiation from bending magnet and wiggler, 15:23214 (R;JP)

BEAM EMITTANCE
The Beam Break-Up Numerical Simulator, 15:22371 (R;US)

BEAM FOCUSING MAGNETS
Recent developments in the BNL intense polarized H^- source program, 15:22376 (R;US)

BEAM INJECTION HEATING
Beam heating of the neutralizer gas of neutral beam injectors, 15:23128 (R;DE)
Negative ion sourcery, 15:23113 (R;NL)

BEAM MONITORING
Possibilities of optical transition radiation using for the U-70 and the UNR proton beam diagnostics, 15:22383 (R;SU;In Russian)

BEAM PERVEANCE
See BEAM EMITTANCE

BEAM TRANSPORT
Development of 3D simulations for heavy ion fusion beam transport and compression problems, 15:23150 (R;US)

BEAM-PLASMA SYSTEMS
Gas dynamic theory of flight of fast electron flux in plasma, 15:23019 (R;SU;In Russian)

BEAMS
See also ATOMIC BEAMS
ION BEAMS
PHOTON BEAMS
POLARIZED BEAMS
Density limitation on focusing of ground state cold H^0 beams, 15:22846 (R;US)

BEARINGS
Interfacial chemical reactions between MoS2 lubricants and bearing materials, 15:22065 (BA;US)
BEAUFORT SEA
See also PRUDHOE BAY
A review of the drilling activities on the Amauligak structure using the Beaudril Molikpaq vessel, 15:21299 (RA;CA)
Arctic drilling structure for the Beaufort Sea, 15:22307 (RA;CA)
Arctic industrial activities compilation. Volume 3, Canadian Beaufort Sea: Seismic and sounding surveys, vessel movements, helicoptor traffic and site-specific activities, 15:21322 (R;CA)
Beaufort Sea Ice Scour Data Base (SCOURBASE), update to 1986, 15:22294 (R;CA)
Beaufort Sea drilling with low toxicity oil based mud, 15:21300 (RA;CA)
Comprehensive planning results in good safety statistics, 15:21311 (RA;CA)
Computer assisted estimating of platform and driling costs, 15:21325 (RA;CA)
Construction and operational issues associated with production in the Canadian Beaufort Sea, 15:22303 (RA;CA)
Geological evolution and analysis of confirmed or suspected gas hydrate localities: Volume 12, Basin analysis formation and stability of gas hydrates of the Beaufort Sea, 15:21353 (R;US)
Molikpaq: The first move, 15:22298 (RA;CA)
On pipelines for the Arctic offshore and considerations about design, construction and operations, 15:21337 (RA;CA)
Project management of Beaufort Sea development, 15:22312 (RA;CA)
The importance to Canada of Beaufort Sea resources, 15:21182 (RA;CA)
BEHAVIOR
AFRRI (Armed Forces Radiobiology Research Institute) reports, July, August, September 1989. Technical report, 15:22741 (R;US)
BELGIAN REACTOR 02
See BR-02 REACTOR
BELT CONVEYORS
Application of conveyor belt monitoring technology to conveyor belt reliability, 15:21393 (RA;CA)
BENZENE
Benzene toxicity. March 1978-July 1989 (Citations from the Life Sciences Collection data base). Report for March 1978-July 1989, 15:22775 (R;US)
Model estimates of the contributions of environmental tobacco smoke to volatile organic compound exposures in office buildings, 15:22002 (R;US)
BENZOPYRENE
Determination of adducts of benzo[a]pyrene to deoxyribonucleic acid using gas chromatography/mass spectrometry techniques, 15:22776 (RA;US)
Disappearance of benzo[a]pyrene and other polycyclic aromatic hydrocarbons from mouse skin in vivo, 15:22777 (RA;US)
BERING SEA
Concrete gravity platform for the Bering Sea, 15:22313 (RA;CA)
BERYLLIA
See BERYLLIUM OXIDES
BERYLLIUM
Effect of correlation on the mean excitation energy of beryllium, 15:22845 (R;US)
Tritium release from irradiated beryllium at elevated temperatures, 15:23144 (R;US)
BERYLLIUM 7
Particulate matter dynamics and phytoplankton seasonality in a reservoir embayment ecosystem, 15:22608 (R;US)
BERYLLIUM 7 BEAMS
A test of the theory of resonant scattering between analog nuclei, 15:22401 (R;US)
BERYLLIUM 9 TARGET
Measurements of e^+e^- pair production at the Bevalac, 15:22893 (R;US)
BERYLLIUM HYDRIDES
Thermal stability and phase studies of LiH + BeH_2 system, 15:22162 (J;DE)
BERYLLIUM MODERATORS
See BERYLLIUM
BERYLLIUM OXIDES
The role of polarity on the stability of graphitic compounds, 15:22137 (R;US)
BETA BACKSCATTERING GAGES
See RADIOMETRIC GAGES
BETA BEAMS (ELECTRONS)
See ELECTRON BEAMS
BETA BEAMS (POSITRONS)
See POSITRON BEAMS
BETA DOSIMETRY
Implementing a new TLD system, 15:22749 (R;US)
Macrodosimetry and microdosimetry in radioimmunotherapy: Progress report, July 15, 1989–July 14, 1990, 15:22953 (R;US)
BETA PARTICLES
Macrodosimetry and microdosimetry in radioimmunotherapy: Progress report, July 15, 1989–July 14, 1990, 15:22953 (R;US)
BIMETALLIC CORROSION
See ELECTROCHEMICAL CORROSION
BINDING ENERGY
Disappearance of benzo[a]pyrene and other polycyclic aromatic hydrocarbons from mouse skin in vivo, 15:22777 (RA;US)
BIOASSAY
Characterization of nitrosated coal liquid at 800 to 850°F, 15:22207 (RA;US)
BIOCENOSES
See ECOSYSTEMS
BIOCHEMICAL ACTIVITY
See BIOCHEMISTRY
BIOCHEMICAL FUEL CELLS
Modern biofuel cells for waste recycling in life support systems. Final report, 15:21957 (R;US)
BIOCHEMISTRY
Assessment of biobased materials, 15:22188 (R;US)
BIODEGRADATION
Biodegradation of old town gas site wastes, 15:21595 (R;US)
Methanogenic gasification of wood, 15:21580 (R;US)
BIOGAS
See METHANE
BIOGEOCENOSES
See ECOSYSTEMS
BIOLOGICAL EFFECTS
See also BIOLOGICAL RADIATION EFFECTS
Biological effects of changes in surface water acid-base chemistry: State-of-Science/Technology report 13, 15:22607 (R;US)
BIOLOGICAL INDICATORS
Search for indicatory criteria to predict effects of chemical induced stress on ecosystemal level. Vol. 12. Final reports of sponsored projects. Pt. 2, 15:22769 (R;DE;In German)
Studies of the effects of chemicals on forest ecosystems and their regenerative ability by means of parasitoids as bioindicators, 15:22770 (RA;DE;In German)
BIOLOGICAL MATERIALS
An analytic model for ionization distributions produced in nanometer sites by protons, 15:22861 (RA;US)
Bethe-born theory of ionization by high-velocity ions and electrons, 15:22762 (RA;US)
Biological soft x-ray contact microscopy: Imaging living CHO-SC1 cells and other biological materials, 15:22756 (R;US)
Determination of the plutonium contamination level in biological samples by liquid scintillation, 15:22201 (R;FR;In French)
BIOLOGICAL PATHWAYS
[The structure of pectins from cotton suspension culture cell walls]: Progress report, 15:22713 (R;US)
BIOLOGICAL RADIATION EFFECTS
AFRRI (Armed Forces Radiobiology Research Institute) reports, July, August, September 1989. Technical report, 15:22741 (R;US)
Biological dosimetry of radiation damage, 15:22758 (R;NL)
BIOLOGICAL RECOVERY
Biological effects of changes in surface water acid-base chemistry: State-of-Science/Technology report 13, 15:22607 (R;US)

BIOLOGICAL TESTING
See BIOASSAY

BIOMASS
Great Lakes Regional Biomass Energy Program: Quarterly report, September 1, 1989 – November 30, 1989, 15:21575 (R;US)
Northeast Regional Biomass Energy Program: Progress report, October 1989 – December 1989, 15:21589 (R;US)
Rotation length and repeated harvesting influence Populus coppice production. Forest Service research note, 15:21578 (R;US)

BIOTECHNOLOGY
NIOSH (National Institute for Occupational Safety and Health) testimony on OSHA (Occupational Safety and Health Administration) guidelines on biotechnology to DOL (Department of Labor), by J. Donald Millar, August 1985, 15:22717 (R;US)

BIRDS
The ecology of hydric hammocks: A community profile, 15:22542 (R;US)

BITUMENS
A new extraction technology for tar sand production, 15:21402 (RA;US)
An estimate of world resources of heavy crude oil and natural bitumen, 15:21184 (RA;US)
CANMET hydrocracking - A Canadian story, 15:21266 (RA;US)
Catalytic hydroprocessing of syncrudes: R and D interests at CANMET, 15:21271 (RA;US)
Chemical composition of bitumen extracts from Nigerian tar sands, 15:21426 (RA;US)
Deep conversion of heavy oil and bitumen via VEBA-Combi-Cracking - An update, 15:21264 (RA;US)
High conversion H-Oil ® processing of Cold Lake and Lloydminster residues in support of Husky bi-provincial project, 15:21414 (RA;US)
Natural analogues of bitumen and bituminized radioactive waste, 15:22189 (R;FI)
Problems in the analysis and characterization of bitumen and heavy oils, 15:21427 (RA;US)
Recovery of bitumen from tar sands by a thermally coupled fluidized-bed process, 15:21400 (RA;US)
The Allied process for upgrading heavy crudes, 15:21267 (RA;US)
The Gulf Canada donor refined bitumen (DRB) process, 15:21259 (RA;US)
The long-term stability of natural bitumen: A case study at the bitumen-impregnated limestone deposit near Holzen/Lower Saxony, FRG, 15:22190 (R;FI)
Upgrading and enhanced recovery of tar sand bitumen and heavy crude using the ART process, 15:21260 (RA;US)
Upgrading of bitumen by hydropyrolysis - A process for low coke and high syncrude yields, 15:21263 (RA;US)

BITUMINOUS COAL
Classification of Canadian coals using pilot plant pressurized gasifier [part of the program of the Federal Panel on Energy R&D (PERD)]: Final report, 15:21141 (R;CA)
Japan's Sunshine Project. 1988 Annual summary of coal liquefaction and gasification, 15:21119 (R;JP)
Japan's Sunshine Project. 1988 Annual summary of coal liquefaction and gasification, 15:21118 (R;JP;In Japanese)

BLACK COATINGS
Low scatter edge blackening compounds for refractive optical elements, 15:22454 (R;US)

BLACK LUNG DISEASE
See PNEUMOCONIOSES

BLACK SHALES
Analysis of Devonian shale stratigraphic, production, and completion data in West Virginia. Final report, July 1, 1984-July 31, 1988, 15:21355 (R;US)

BLADES (TURBINES)
See TURBINE BLADES

BLANKETS (BREEDING)
See BREEDING BLANKETS

BLAST FURNACES
Method for estimating maximum exposured temperature of coke by laser Raman spectometry, 15:21128 (RA;JP;In Japanese)

BLOWDOWN
Application of signature analysis for determining the operational readiness of motor-operated valves under blowdown test conditions, 15:21828 (RA;US)
Early results of gate valve flow interruption blowdown tests, 15:21834 (RA;US)

BODY COMPOSITION
Dual photon absorptiometry: Validation of mineral and fat measurements, 15:22722 (R;US)

BOILER FUEL
See BOILER FUELS

BOILER FUELS
US Navy mobility fuels: Worldwide survey and analysis of both commercial and Navy fuels. Final report, 15:21305 (R;US)

BOILERS
See also FLUIDIZED BED BOILERS
Accurate boiler models for large scale simulation, 15:22018 (RA;CA)
Analysis of state and federal sulfur dioxide emission regulations for combustion sources (revised), 15:22513 (R;US)
Copper oxychloride as a fireside additive in coal-fired utility boilers: Final report, 15:21158 (R;US)

BOILING WATER COOLED AND MODERATED REACTOR
See BWR TYPE REACTORS

BOLOMETERS
A four channel He-3 cooled balloon-borne bolometer radiometer, 15:22462 (RA;US)

BOLTED JOINTS
The effect of oxidation on the integrity of bolted structures, 15:21706 (R;GB)

BOLTZMANN-VLASOV EQUATION
Efficient, high order solution technique for the Liouville equation, 15:22981 (R;US)

BONNEVILLE POWER ADMINISTRATION
1989 Pacific Northwest loads and resources study: Technical appendix, 15:21935 (R;US)
Draft 1990 Resource Program, 15:21606 (R;US)
Draft 1990 Resource Program technical report, 15:21934 (R;US)
Draft Resource Acquisition Approaches Plan: Supplement to draft 1990 resource program technical report, 15:21936 (R;US)
Draft global warming study: Draft 1990 Resource Program, 15:21602 (R;US)

BOREHOLES
Environmental corrections for a neutron-induced gamma-ray spectroscopy logging system in an air-filled borehole: Revision 1, 15:22450 (R;US)
Environmental sampling and mud sampling program of CSDP [Continental Scientific Drilling Program] core hole VC-2B, Valles Caldera, New Mexico, 15:21633 (R;US)
Subsurface TE scattering by tunnels using a surface line current, 15:22795 (R;US)

BORIC ACID
Tribological properties of boric acid and boric acid forming surfaces: Part 1, Crystal chemistry and self-lubricating mechanism of boric acid, 15:22169 (R;US)
Tribological properties of boric acid and boric-acid-forming surfaces: Part 2, Formation and self-lubrication mechanisms of boric acid films on boron- and boric-oxide-containing surfaces, 15:22170 (R;US)

BORON
Nuclear production research expands materials knowledge, 15:21729 (J;US)
Tribological properties of boric acid and boric-acid-forming surfaces: Part 2, Formation and self-lubrication mechanisms of boric acid films on boron- and boric-oxide-containing surfaces, 15:22170 (R;US)

BORON CHLORIDES
Electron collisions with processing plasma constituents, 15:23080 (BA;US)

BORON FLUORIDES
Laser action from a tetramethylpyrromethene BF_2 complex, 15:22314 (R;US)
BORON NITRIDES
Determination of impurities in fine ceramics by inductively coupled plasma atomic emission spectrometry, 15:22155 (R;JP)
Optical diagnostics for a high power, RF-inductively coupled plasma, 15:22159 (BA;US)
BORON OXIDES
Tribological properties of boric acid and boric-acid-forming surfaces: Part 2, Formation and self-lubrication mechanisms of boric acid films on boron- and boric-oxide-containing surfaces, 15:22170 (R;US)
BOROSILICATE GLASS
High level radioactive waste: Doing something about it, 15:21481 (R;US)
BOROSILICATES
See BOROSILICATE GLASS
BOUNDARY VALUE PROBLEMS
See BOUNDARY-VALUE PROBLEMS
BOUNDARY-VALUE PROBLEMS
Domain decomposition for a boundary-value problem with a shock layer, 15:22876 (R;US)
BPA
See BONNEVILLE POWER ADMINISTRATION
BR-02 REACTOR
Preliminary low-enrichment uranium (LEU) fuel cycle analyses for the Belgian BR2 reactor, 15:21765 (RA;US)
Summary of the studies carried out for the definition of the maximum allowed heat flux in the BR2 reactor, 15:21770 (RA;US)
BR-2 ZERO POWER MOCK-UP REACTOR
See BR-02 REACTOR
BRACKISH WATER ECOSYSTEMS
See AQUATIC ECOSYSTEMS
BRAIN
Development of ^{99m}Tc-labelled the d,1-diasteroisomer of HM-PAO for cerebral blood flow imaging: Final report for the period 15 December 1988 - 22 July 1989, 15:22735 (R;XA)
Effect of exposure to microwaves on the neuroendocrine status of the rat. Final report, 1 January 1979-30 June 1980, 15:22778 (R;US)
BRAZIL
Oil sands of Sao Paulo state, Brazil and La Brea de Chump, Peru: A geologic perspective, 15:21380 (RA;US)
BREAKWATERS
See DAMS
BREEDING BLANKETS
ITER [International Thermonuclear Experimental Reactor] R and D breeder blanket materials, 15:23107 (R;US)
Investigation of γ lithium aluminate as tritium breeding material for a fusion reactor blanket, 15:23103 (R;FR)
Preliminary study of a blanket handling device and evaluation of the feasibility of eliminating the spread of radioactive contamination, 15:23104 (R;FR)
[Thermonuclear experimental reactor workshop on materials and components]: Foreign trip report, January 27, 1990–February 14, 1990, 15:23138 (R;US)
BREEDING PELLETS
Investigation of γ lithium aluminate as tritium breeding material for a fusion reactor blanket, 15:23103 (R;FR)
BREMSSTRAHLUNG (MAGNETIC)
See SYNCHROTRON RADIATION
BRIDGES
Heart-disease mortality among bridge and tunnel officers exposed to carbon monoxide, 15:22517 (R;US)
BRINES
Uranium-thorium series radionuclides in brines and reservoir rocks from two deep geothermal boreholes in the Salton Sea geothermal field, southeastern California, 15:21538 (J;US)
BRITISH COLUMBIA
A prospectus for the Kelly Lake Substation to Cheekye Substation second 500 kV transmission line, 15:21854 (R;CA)
Hog fuel availability in the north coastal and interior regions of British Columbia, 1986, 15:21591 (R;CA)
Hydrocarbon and by-product reserves in British Columbia, 1988, 15:21352 (R;CA)
Proposal for the Fraser Valley substation and Puget Sound power and light intertie study, 15:21853 (R;CA)
The Third Williston to Kelly Lake 500 kv transition line: Project rationale, 15:21855 (R;CA)

Early results of gate valve flow interruption blowdown tests, 15:21834 (RA;US)
Burnable Poisons
Evaluation of discrepancies in assembly cross-section generator codes: Volume 3, Assembly calculations: Final report, 15:21794 (R;US)
Containment Buildings
Posttest analysis of a 1:6-scale reinforced concrete reactor containment building, 15:21848 (R;US)
Coolant Cleanup Systems
Early results of gate valve flow interruption blowdown tests, 15:21834 (RA;US)
Crack Propagation
Environmentally assisted cracking in light water reactors: Semiannual report, April 1988–September 1988: Volume 7, 15:21839 (R;US)
Fuel Assemblies
Evaluation of discrepancies in assembly cross-section generator codes: Volume 3, Assembly calculations: Final report, 15:21794 (R;US)
Fuel Elements
Modeling of in-vessel fission product release including fuel morphology effects for severe accident analyses: Advanced Reactor Severe Accident Program, 15:21791 (R;US)
High Pressure Coolant Injection
Early results of gate valve flow interruption blowdown tests, 15:21834 (RA;US)
Pipe Joints
Degraded piping program - Phase II. Battelle Columbus Division, 15:21691 (RA;US)
Pressure Vessels
Acoustic emission - flaw relationships for in-service monitoring of nuclear reactor pressure boundaries, 15:21696 (RA;US)
Dosimetry measurement reference data base for LWR pressure vessel irradiation surveillance, 15:21738 (RA;US)
Heavy-section steel technology program, 15:21690 (RA;US)
High-temperature crack-arrest tests using 152-mm-thick SEN wide plates of low-upper-shelf base material: Tests WP-2.2 and WP-2.6, 15:21700 (R;US)
LWR pressure vessel surveillance dosimetry improvement program, 15:21693 (RA;US)
Primary Coolant Circuits
Effectiveness and safety aspects of selected decontamination methods, 15:21720 (RA;US)
Radiation Protection
Progress in radiation control technology: Final report, 15:21799 (R;US)
Reactor Accidents
An exploratory sensitivity study with the MACCS [MELCOR Accident Consequence Code System] Reactor Accident Consequence Model, 15:21850 (R;US)
Reactivity accidents: A reassessment of the design-basis events, 15:21788 (R;US)
SCDAP/RELAP5/MOD2 code manual: Volume 4, MATPRO: A library of materials properties for light-water-reactor accident analysis, 15:21842 (R;US)
Reactor Components
Development and validation of a real-time SAFT-UT system for in-service inspection of LWRs, 15:21697 (RA;US)
Effect of decontamination on aging processes and considerations for life extension, 15:21699 (RA;US)
Elastic-plastic fracture mechanics evaluation of light-water-reactor (LWR) alloys, 15:21692 (RA;US)
Evaluation and improvement in nondestructive examination (NDE) reliability for in-service inspection of light water reactors, 15:21695 (RA;US)
Evaluation of advanced and current leak detection systems, 15:21698 (RA;US)
Reactor Cooling Systems
Application of signature analysis for determining the operational readiness of motor-operated valves under blowdown test conditions, 15:21828 (RA;US)
Guillotine breaks indirectly caused by seismically-induced failures, 15:21819 (RA;US)
Probability of crack-induced failure in the BWR recirculation piping, 15:21815 (RA;US)
Reactor Cores
Melt progression, oxidation, and natural convection in a severely damaged reactor core, 15:21845 (R;US)
Precursors to potential severe core damage accidents: 1988 a status report: Appendixes B and C, 15:21840 (R;US)
Reactor Licensing
Historical data summary of the Systematic Assessment of Licensee Performance: Revision 5, 15:21714 (R;US)
Reactor Operation
Licensee Event Report (LER) compilation for month of January 1990, 15:21715 (R;US)
Reactor Vessels
Current applications of vibration monitoring and neutron noise analysis: Detection and diagnosis of structural degradation of reactor vessel internals resulting from operational aging, 15:21849 (R;US)
Rhr Systems
Nuclear plant aging study of residual heat removal systems, 15:21811 (RA;US)
Seismic Effects
The role of parameter uncertainty in seismic risk assessment, 15:21824 (RA;US)
Stainless Steels
Long-term aging embrittlement of cast duplex stainless steels in LWR systems, 15:21694 (RA;US)

CARBON
See also ACTIVATED CARBON
DIAMONDS
GRAPHITE
Characterization of various coals by FT-IR, ^{13}C CP/MAS FT-NMR and Raman spectrometry, 15:21153 (RA;JP)
Measurement of double differential production cross sections for charged particles for the validation of theoretical models used to describe interactions of high energy protons with matter, 15:22885 (R;DE;In German)
Program to study the oxidation of carbon-carbon composites and coatings on these materials. Final report, 15 July 1986-13 July 1989, 15:22165 (R;US)

CARBON 12 REACTIONS
High spin levels populated in multinucleon transfer reaction with 480 MeV ^{12}C, 15:22933 (R;FR)

CARBON 12 TARGET
Ground-state correlations in ^{12}C and the mechanism of the (e,e'p) reaction, 15:22923 (R;NL)
High spin levels populated in multinucleon transfer reaction with 480 MeV ^{12}C, 15:22933 (R;FR)
On the spin-orbit deformation in inelastic scattering of polarized protons at intermediate energy, 15:22924 (R;FR)

CARBON 14
Data compilation to accompany residence times of Minnesota ground waters. Final report, 15:22609 (R;US)

CARBON 14 COMPOUNDS
Molecular probes for elucidating mechanisms of action of chemical threat agents. Annual report, 15 February 1988-14 February 1989, 15:22490 (R;US)

CARBON DIOXIDE
Environmental corrections for a neutron-induced gamma-ray spectroscopy logging system in an air-filled borehole: Revision 1, 15:22450 (R;US)

CARBON DIOXIDE INJECTION
Adsorption properties of carbon dioxide enchanced oil recovery additives: Final report, 15:21290 (R;US)

CARBON DIOXIDE LASERS
Continuous-wave double-resonance ionization mass spectrometry, 15:22577 (RA;US)

CARBON FIBERS
Density of intercalated graphite fibers, 15:22153 (R;US)

CARBON FLUORIDES
Electron collisions with processing plasma constituents, 15:23080 (BA;US)

CARBON MONOXIDE
Diagnostic development and support of MHD [magnetohydrodynamics] test facilities: Technical progress report, January, February, March 1989, 15:21952 (R;US)
Heart-disease mortality among bridge and tunnel officers exposed to carbon monoxide, 15:22517 (R;US)
Metal alkoxides: Models for metal oxides: Alkoxide ligands in early transition metal organometallic chemistry: Progress report, 15:22221 (R;US)
The effect of catalyst preparation on the performance of alumina-supported ruthenium catalysts. II. The impact of residual chloride, 15:21145 (J;US)
The effect of catalyst preparation on the performance of alumina-supported ruthenium catalysts. I. The impact of catalytic precursor on particle size and catalytic activity, 15:21144 (J;US)
The role of lattice anion vacancies in the activation of CO and as the catalytic site for methanol synthesis over zirconium dioxide and yttria-doped zirconium dioxide, 15:21146 (J;US)

CARBONATES
Environmental corrections for a neutron-induced gamma-ray spectroscopy logging system in an air-filled borehole: Revision 1, 15:22450 (R;US)

CARCINOGENESIS
See also LEUKEMOGENESIS
Is natural background or radiation from nuclear power plants leukemogenic?, 15:22745 (R;US)

CARDIOVASCULAR DISEASES
Heart-disease mortality among bridge and tunnel officers exposed to carbon monoxide, 15:22517 (R;US)

CARS SPECTROSCOPY
See RAMAN SPECTROSCOPY

CASINGS (WELL)
See WELL CASINGS

CASTINGS
Long-term aging embrittlement of cast duplex stainless steels in LWR systems, 15:21694 (RA;US)

CATALYSTS
See also ELECTROCATALYSTS
Compositional aspect of iron Fischer-Tropsch catalyst: An XPS/reaction study, 15:21143 (J;US)
The effect of catalyst preparation on the performance of alumina-supported ruthenium catalysts. II. The impact of residual chloride, 15:21145 (J;US)
The effect of catalyst preparation on the performance of alumina-supported ruthenium catalysts. I. The impact of catalytic precursor on particle size and catalytic activity, 15:21144 (J;US)

CATALYTIC CRACKING
Cracking activity of dealuminated Y-zeolites, 15:21274 (RA;US)
Fluidized-bed catalytic cracking (FFC) catalyst fabrication: Final report and appendix, 15:21302 (R;CA)
New tools for assessing the economic value of heavy crude oils and fractions, 15:21268 (RA;US)

CATION EXCHANGE CAPACITY
See CATIONS

CATIONS
Radiative properties of UO^+. Technical report, 15 April 1988-15 April 1989, 15:22844 (R;US)

CAVITIES

CHROMIUM
Corrosion properties of Fe_3Al in H_2S-H_2-H_2O mixtures, 15:21120 (R;US)
L shell XANES [x-ray absorption near edge structure] for solid metals: Ti, V, Cr, Fe, Ni, Cu, 15:22865 (R;US)

CHROMIUM 52 TARGET
Alpha-particles as probes of nuclear shape in the rare earths and structure effects on proton emission in the mass 80 region, 15:22914 (R;US)

CHROMIUM BASE ALLOYS
Environmental effects on corrosion in the Tuff repository, 15:21512 (R;US)

CHROMIUM ISOTOPES
Nuclear structure effects in exciton level densities, 15:22928 (R;US)

CHROMIUM OXIDES
Alternative materials for solid oxide fuel cells, 15:21959 (R;US)

CHROMIUM STEELS
Design and processing of strong-tough microcomposite steels, 15:22119 (R;US)

CHROMODYNAMICS
See QUANTUM CHROMODYNAMICS

CHROMOSPHERE
Dynamics of flare-driven chromospheric condensations, 15:22835 (J;US)
Flare dynamics, 15:22829 (RA;GB)

CITIES
See URBAN AREAS

CLATHRATES
Synthesis for materials for reversible uptake and useful functionalization of methane. Annual report, January-December 1988, 15:21374 (R;GB)

CLAYS
Small angle neutron scattering studies of diffusion and permeation through pores in clays, 15:22548 (R;GB)

CLEAN AIR ACT
Catching our breath: Next steps for reducing urban ozone, 15:22512 (R;US)

CLEAN WATER ACT
Initiation decision report: Nonpoint source discharge. Technical note (Final), July 1987-June 1988, 15:22587 (R;US)
Mercury monitoring of water and sediment in Oak Ridge National Laboratory streams during 1989, 15:22606 (R;US)

CLIMATE MODELS
Southern oscillation in the OSU coupled upper ocean/atmosphere GCM, 15:22796 (R;US)

CLIMATES
Atmospheric Radiation Measurement Program Plan, 15:22498 (R;US)
Simulation of landscape disturbances and the effect of climatic change: Technical progress report No. 1, [July 1989–February 1990], 15:22501 (R;US)
Status of surface processes in the LLNL zonally symmetric model, 15:22540 (R;US)

United States Historical Climatology Network (HCN) serial temperature and precipitation data, 15:22509 (R;US)

CLONE CELLS
Kinetics of C3H 10T1/2 mouse cells, 15:22764 (RA;US)

CLOSTRIDIUM
Genetic, physiological and nutritional studies on Clostridium strains isolated and screened for characteristics useful in enhanced oil recovery, with special reference to high salt t. .erance: Final report, 15:21285 (R;US)

CLOTHES DRYERS
Modular apparatus for laundry dryer heat recovery: Technical progress report, 15:21968 (R;US)

CLOUDS
Atmospheric Radiation Measurement Program Plan, 15:22498 (R;US)
Cloud albedo and climate perturbations due to anthropogenic sulfate, 15:22495 (R;US)

CLUSTERS (GALAXY)
See GALAXY CLUSTERS

CLUSTERS (ION)
See ION PAIRS

CLUSTERS (STAR)
See STAR CLUSTERS

CO-GENERATION
See COGENERATION

CO2 FLOODING
See CARBON DIOXIDE INJECTION

COAL
See also SUBBITUMINOUS COAL

Bulk Density
Effect of bulk density of charged coal on the distribution of CSR across the oven width, 15:21152 (RA;JP;In Japanese)

Carbonization
Effect of bulk density of charged coal on the distribution of CSR across the oven width, 15:21152 (RA;JP;In Japanese)
Influence of coal properties on pore structure of coke, 15:21151 (RA;JP;In Japanese)

Chemical Properties
[Basic properties of coals and other solids]: Quarterly report No. 2, 15:21150 (R;US)

Coal Rank
Characterization of various coals by FT-IR, ^{13}C CP/MAS FT-NMR and Raman spectrometry, 15:21153 (RA;JP)
Influence of coal properties on pore structure of coke, 15:21151 (RA;JP;In Japanese)
Method for estimating maximum exposured temperature of coke by laser Raman spectometry, 15:21128 (RA;JP;In Japanese)

Coking
Effect of bulk density of charged coal on the distribution of CSR across the oven width, 15:21152 (RA;JP;In Japanese)

Combustion
Acoustically enhanced combustion of micronized coal water slurry fuel: Final report, 15:21167 (R;US)

Combustion Products
Reduction of NO_x and SO_2 emissions from coal burning pulse combustors: Quarterly technical progress report, October 1, 1989–December 31, 1989, 15:21168 (R;US)

Combustors
Coal, a fuel option for heavy oil recovery operations, 15:21421 (RA;CA)

Conversion
Anaerobic sequencing batch reactor treatment of coal conversion wastewaters: Final technical report, 15:21157 (R;US)
Designing a performance based cost-sharing system for the Clean Coal Technology Program, 15:21179 (R;US)

Coprocessing
Development of analytical procedures for coprocessing: Quarterly technical progress report for the period July 1 through September 30, 1989, 15:21303 (R;US)

Degassing
Permeability changes resulting from gas desorption. Final report, May 1988-June 1989, 15:21156 (R;US)

Desulfurization
Coal surface control for advanced fine coal flotation: Quarterly report No. 5, October 1, 1989–December 31, 1989, 15:21147 (R;US)

Dusts
Investigation of the determination of respirable quartz on filter media using Fourier transform infrared spectrophotometry, 15:22510 (R;US)

Flue Gas
Removal of SO_x and NO_x in coal-fired flue gas by the addition of ozone and ammonia, 15:21159 (R;JP;In Japanese)

Fluidized-Bed Combustion
Clean coal technology, another step in commercialization of FBC, 15:21176 (BA;US)
FBC engineering correlations for estimating the combustion efficiency of a range of fuels, 15:21171 (BA;US)

Fluidized-Bed Combustors
Current state of atmospheric fluidized-bed combustion technology, 15:21170 (R;US)

Fossil-Fuel Power Plants
Prediction method of unburned carbon concentration in fly ash. Evaluation of combustibility by considering macerals in coal, 15:21166 (R;JP;In Japanese)

Infrared Spectrometers
86th coke special lecture. Proceedings (1986), 15:21132 (R;JP;In Japanese)

Macerals
Influence of coal properties on pore structure of coke, 15:21151 (RA;JP;In Japanese)
Method for estimating maximum exposured temperature of coke by laser Raman spectometry, 15:21128 (RA;JP;In Japanese)

Microstructure
Prediction method of unburned carbon concentration in fly ash. Evaluation of combustibility by considering macerals in coal, 15:21166 (R;JP;In Japanese)

Nuclear Magnetic Resonance
86th coke special lecture. Proceedings (1986), 15:21132 (R;JP;In Japanese)

Oxidation
Novel electrochemical process for coal conversion: Final report, 15:21122 (R;US)

Permeability
Permeability changes resulting from gas desorption. Final report, May 1988-June 1989, 15:21156 (R;US)

Physical Properties
86th coke special lecture. Proceedings (1986), 15:21132 (R;JP;In Japanese)

Raman Spectroscopy
86th coke special lecture. Proceedings (1986), 15:21132 (R;JP;In Japanese)

Reduction
Novel electrochemical process for coal conversion: Final report, 15:21122 (R;US)

Sorptive Properties
Thermodynamics of coal liquid/solid systems: Final report, 15:21127 (R;US)

Surface Properties
Coal surface control for advanced fine coal flotation: Quarterly report No. 5, October 1, 1989–December 31, 1989, 15:21147 (R;US)

Two-Phase Flow
Determination of flow-regime boundaries for cohesive particles: Project 61093 Quarterly report, March 20–June 19, 1989, 15:21149 (R;US)

Volatile Matter
Effect of bulk density of charged coal on the distribution of CSR across the oven width, 15:21152 (RA;JP;In Japanese)

Wear
A study of coal particle shape and three-body wear: Quarterly report, November 1989–January 1990, 15:21148 (R;US)

COAL DEPOSITS
Hydrologic characterization of coal seams for methane recovery. Final report, January 1987-April 1989, 15:21362 (R;US)

Permeability changes resulting from gas desorption. Final report, May 1988-June 1989, 15:21156 (R;US)
Quarterly review of methane from coal seams Technology. Volume 7, Numbers 1 and 2. October 1989, 15:21363 (R;US)

COAL FINES
Permeability changes resulting from gas desorption. Final report, May 1988-June 1989, 15:21156 (R;US)
Prediction method of unburned carbon concentration in fly ash. Evaluation of combustibility by considering macerals in coal, 15:21166 (R;JP;In Japanese)

COAL GAS
Behavior of NH_3 in coal derived gas (Part 1). Continuous ammonia analyzer for coal derived gas, 15:21121 (R;JP;In Japanese)
Cyanide in MGP (manufactured gas plant) wastes: Investigation of analytical methods. Topical report, January 1988-June 1989, 15:21577 (R;US)
Manufactured gas plants and the National Priorities List: A technical review. Topical report, August 1988-July 1989. Final report, 15:21597 (R;US)
Soil-gas investigations at MGP (manufactured gas plant) sites: An evaluation of alternative compounds. Topical report, January 1989-June 1989. Final report, 15:21596 (R;US)

COAL GASIFICATION
See also FLASH HYDROPYROLYSIS PROCESS
Coal gasification: An environmental, health, and safety overview. Topical report, 15:21138 (R;US)
Fundamental studies of catalytic gasification: Quarterly report for October 1, 1989-December 31, 1989, 15:21136 (R;US)
Japan's Sunshine Project. 1988 Annual summary of coal liquefaction and gasification, 15:21118 (R;JP;In Japanese)
Japan's Sunshine Project. 1988 Annual summary of coal liquefaction and gasification, 15:21119 (R;JP)
Proceedings of the ninth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2, 15:21124 (R;US)
Proceedings of the ninth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1, 15:21123 (R;US)
Production of gas fuel and chemicals by the gasification of waste solid and coal. Report for August 1986-July 1987, 15:21139 (R;TW)
Reactive absorption of hydrogen sulfide by a polyglycol ether solution of sulfur dioxide, 15:21135 (R;US)

COAL GASIFICATION PLANTS
Behavior of NH_3 in coal derived gas (Part 1). Continuous ammonia analyzer for coal derived gas, 15:21121 (R;JP;In Japanese)
Ground-water contamination at an inactive coal- and oil-gasification plant site, Gas Works Park, Seattle, Washington. Water-resources investigations, 15:22611 (R;US)
Manufactured gas plants and the National Priorities List: A technical review. Topical report, August 1988-July 1989. Final report, 15:21597 (R;US)
Soil-gas investigations at MGP (manufactured gas plant) sites: An evaluation of alternative compounds. Topical report, January 1989-June 1989. Final report, 15:21596 (R;US)

COAL INDUSTRY
Mining and energy challenges, 15:21389 (R;CA)
NIOSH (National Institute for Occupational Safety and Health) testimony on coal mining before the Subcommittee on Energy and Power, House Committee on Interstate and Foreign Commerce, by Hohn F. Finklea, May 26, 1977, 15:21180 (R;US)

COAL LIQUEFACTION
See also BCL PROCESS
FLASH HYDROPYROLYSIS PROCESS
Catalyst dispersion and activity under conditions of temperature-staged liquefaction: Technical progress report, October–December 1989, 15:21126 (R;US)
Hydrous metal oxide-supported catalysts: Part 1, Preparation chemistry and physical and chemical properties, 15:21140 (R;US)
Japan's Sunshine Project. 1988 Annual summary of coal liquefaction and gasification, 15:21118 (R;JP;In Japanese)
Japan's Sunshine Project. 1988 Annual summary of coal liquefaction and gasification, 15:21119 (R;JP)
Japan's Sunshine Project. 1988 Annual summary of coal liquefaction and gasification, 15:21118 (R;JP;In Japanese)
Japan's Sunshine Project. 1988 Annual summary of coal liquefaction and gasification, 15:21119 (R;JP)
Japan's Sunshine Project. 1988 Annual summary of coal liquefaction and gasification, 15:21118 (R;JP;In Japanese)
Thermodynamics of coal liquid/solid systems: Final report, 15:21127 (R;US)

COAL LIQUIDS
Characterization of nitrosated coal liquid at 800 to 850°F, 15:22207 (RA;US)
Disappearance of benzo[a]pyrene and other polycyclic aromatic hydrocarbons from mouse skin in vivo, 15:22777 (RA;US)
Thermodynamics of coal liquid/solid systems: Final report, 15:21127 (R;US)

COAL MINING
Ground subsidence due to mining operations. October 1976-November 1989 (Citations from the COMPENDEX data base). Report for October 1976-November 1989, 15:22576 (R;US)
Health-hazard evaluation report MHETA 80-000-117, La Rosa Fuel Company, Clarksburg, West Virginia, 15:21155 (R;US)
NIOSH (National Institute for Occupational Safety and Health) testimony on coal mining before the Subcommittee on Energy and Power, House Committee on Interstate and Foreign Commerce, by Hohn F. Finklea, May 26, 1977, 15:21180 (R;US)
NIOSH (National Institute for Occupational Safety and Health) testimony on coal mine health research before the Subcommittee on Labor Standards, House Committee on Education and Labor, by Edward J. Baier, June 29, 1977, 15:21181 (R;US)
NIOSH (National Institute for Occupational Safety and Health) testimony on mine health research before the Subcommittee on Compensation, Health and Safety; House Committee on Education and Labor, by Edward J. Baier, April 4, 1977, 15:21895 (R;US)

COAL TAR
Manufactured gas plants and the National Priorities List: A technical review. Topical report, August 1988-July 1989. Final report, 15:21597 (R;US)

COAL-DERIVED LIQUIDS
See COAL LIQUIDS

COAL-OIL MIXTURES

FUEL OILS
FUEL SLURRIES

COASTAL REGIONS
The Atlantic continental margin: US: Decade of North American Geology Project, 15:22787 (B;US)

COASTAL WATERS
Continental shelf processes affecting the oceanography of the South Atlantic Bight: Progress report, June 1989–May 1990, 15:22789 (R;US)
Cycling of the main natural alpha emitters in the coastal marine environment: Final report for the period 1 March 1986 - 30 June 1989, 15:22602 (R;XA)
Radioactivity in surface and coastal waters of the British Isles, 1988, 15:22604 (R;GB)
Radioactivity of Focus vesiculosus along the Finnish coast in 1987: Supplement 9 to annual report 1987 (STUK-A-74), 15:22707 (R;FI)
Studies of environmental radioactivity in Cumbria - Pt. 18: Plutonium and americium behaviour in Cumbrian near-shore waters, 15:22599 (R;GB)

COATED FUEL PARTICLES
Design criteria, production and total integrity assessment of fuels of the High Temperature Engineering Test Reactor, 15:21777 (R;JP;In Japanese)

COATINGS
See also BLACK COATINGS
PROTECTIVE COATINGS
Program to study the oxidation of carbon-carbon composites and coatings on these materials. Final report, 15 July 1986-13 July 1989, 15:22165 (R;US)

COAXIAL CABLES
Time domain spectroscopy to monitor the condition of cable insulation, 15:21808 (RA;US)

COBALT
Bonding in thin epitaxial $CoSi_2$ films on Si(100), 15:22869 (BA;US)

COBALT 60
^{60}Co accumulation by scenedesmus obliquus. Mechanism of uptake and relative contribution of radionuclide adsorption and absorption, 15:22746 (R;FR;In French)
Activation of cobalt by neutrons from the Hiroshima bomb, 15:22760 (R;US)
Leakage of an irradiator source: The June 1988 Georgia RSI [Radiation Sterilizers, Inc.] incident, 15:22549 (R;US)

COBALT ISOTOPES
See also COBALT 60
Nuclear structure effects in exciton level densities, 15:22928 (R;US)

COBALT SILICIDES
Bonding in thin epitaxial $CoSi_2$ films on Si(100), 15:22869 (BA;US)

COGENERATION
Cogeneration: Economic and technical analysis. February 1987-January 1988 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for February 1987-January 1988, 15:22055 (R;US)
Cogeneration: Economic and technical analysis. February 1988-December 1989 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for February 1988-December 1989, 15:22056 (R;US)
Cogeneration: Economic and technical analysis. October 1986-September 1987 (Citations from the COMPENDEX data base). Report for October 1986-September 1987, 15:22058 (R;US)
Cogeneration: economic and technical analysis. October 1987-December 1989 (Citations from the COMPENDEX data base). Report for October 1987-December 1989, 15:22059 (R;US)
Cost-benefit analysis of variable-speed generators applied to peakshaving/cogeneration systems. Topical report, December 1988-May 1989, 15:22075 (R;US)
Development of small gas-turbine-based steam cogeneration system. Phase 1. Final report, July 1987-December 1988, 15:22074 (R;US)

COGENERATION PLANTS

ENVIRONMENTAL EXPOSURE
Health Hazards
Health assessment for Anchor Lith Kemko, Hicksville, New York, Region 2. CERCLIS No. NYD001485226. Preliminary report, 15:22672 (R;US)
Health assessment for Applied Environmental Services, Glenwood Landing, New York, Region 2. CERCLIS No. NYD980535652. Preliminary report, 15:22568 (R;US)
Health assessment for Barceloneta Landfill, Florida Afuefra, Puerto Rico, Region 2. CERCLIS No. PRD98059129. Preliminary report, 15:22688 (R;US)
Health assessment for Batavia Landfill, Genesee County, Batavia, New York, Region 2. CERCLIS No. NYD980507693. Preliminary report, 15:22670 (R;US)
Health assessment for Beachwood Borough and Berkeley Township National Priorities List (NPL) Site, Ocean County, New Jersey, Region 2. CERCLIS No. NJD980654123. Final report, 15:22618 (R;US)
Health assessment for Bog Creek Farm Site (BCFS) National Priorities List (NPL) site, Howell Township, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD063157150. Final report, 15:22619 (R;US)
Health assessment for Burnt Fly Bog National Priorities List Site, Marlboro, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD980504997. Final report, 15:22620 (R;US)
Health assessment for Byron Barrel, Genesee County, Byron, New York, Region 2. CERCLIS No. NYD980780670. Preliminary report, 15:22671 (R;US)
Health assessment for CPS/Madison Industries, Old Bridge Township, Middlesex County, New Jersey, Region 2. CERCLIS No. NJD002141190. Preliminary report, 15:22627 (R;US)
Health assessment for Caldwell Trucking Company, Fairfield, New Jersey, Region 2. CERCLIS No. NJD048798953. Preliminary report, 15:22554 (R;US)
Health assessment for Chemical Control Corporation, Elizabeth, New Jersey, Region 2. CERCLIS No. NJD000607481. Final report, 15:22621 (R;US)
Health assessment for Chemical Leaman Tank Lines, Inc. (CLTL) NPL (National Oriorities List) site, Logan Township, Gloucester County, New Jersey, Region 2. CERCLIS No. NJD047321443. Final report, 15:22622 (R;US)
Health assessment for Chemsol Inc., Piscataway, Middlesex County, New Jersey, Region 2. CERCLIS No. NJD980528889. Preliminary report, 15:22623 (R;US)
Health assessment for Ciba-Geigy National Priorities List (NPL) site, Dover Township, Ocean County, New Jersey, Region 2. CERCLIS No. NJD00150217. Final report, 15:22624 (R;US)
Health assessment for Claremont Poly Chemical Corp., Nassau County, Old Bethpage, New York, Region 2. CERCLIS No. NYD002044584. Preliminary report, 15:22673 (R;US)
Health assessment for Colesville Landfill, Broome County, Colesville, New York, Region 2. CERCLIS No. NYD980768691. Preliminary report, 15:22674 (R;US)
Health assessment for Combe Fill North Landfill, Mount Olive Township, New Jersey, Region 2. CERCLIS No. NJD980530596. Final report, 15:22625 (R;US)
Health assessment for Combe Fill South Landfill, Morris County, New Jersey, Region 2. CERCLIS No. NJD094966611. Final report, 15:22626 (R;US)
Health assessment for Cortese Landfill, Sullivan County, Tusten, New York, Region 2. CERCLIS No. NYD980528475. Preliminary report, 15:22569 (R;US)
Health assessment for Cosden Chemical Coatings NPL (National Priorities List) site, Beverly, New Jersey, Region 2. CERCLIS No. NJD000565531. Preliminary report, 15:22555 (R;US)
Health assessment for Curcio Scrap Metal Yard, Saddle Brook Township, Bergen County, New Jersey, Region 2. CERCLIS No. NJD011717584. Preliminary report, 15:22628 (R;US)
Health assessment for D'Imperio Property Site, Hamilton Township, New Jersey, Region 2. CERCLIS No. NJD980529416. Final report, 15:22629 (R;US)
Health assessment for Derewal Chemical Company National Priorities List (NPL) site, Kingwood Township, Hunter-

don County, New Jersey, Region 2. CERCLIS No. NJD980761373. Preliminary report, 15:22630 (R;US)

Health assessment for Diamond Alkali/80 Lister Avenue, Newark, New Jersey, Region 2. CERCLIS No. NJD980528996. Final report, 15:22631 (R;US)

Health assessment for Evor Phillips Leasing, Old Bridge Township, Middlesex County, New Jersey, Region 2. CERCLIS No. NJD980654222. Preliminary report, 15:22632 (R;US)

Health assessment for F.M.C. Corporation, Orleans County, Shelby, New York, Region 2. CERCLIS No. NYD000511857. Preliminary report, 15:22570 (R;US)

Health assessment for Facet Enterprises, Inc., Chemung County, Elmira Heights, New York, Region 2. CERCLIS No. NYD073675514. Preliminary report, 15:22676 (R;US)

Health assessment for Fairlawn Wellfield, Fairlawn, New Jersey, Region 2. CERCLIS No. NJD980654107. Preliminary report, 15:22633 (R;US)

Health assessment for Fibers Public Supply Wells, Guayama, Puerto Rico, Region 2. CERCLIS No. PRD980763783. Preliminary report, 15:22574 (R;US)

Health assessment for Fort Dix Sanitary Landfill, Pemberton Township, New Jersey, Region 2. CERCLIS No. NJ2210020275. Preliminary report, 15:22634 (R;US)

Health assessment for Fulton Terminals Site, Fulton, New York, Region 2. CERCLIS No. NYD980593099. Final report, 15:22669 (R;US)

Health assessment for GEMS Landfill National Priorities List (NPL) site, Gloucester Township, Camden County, New Jersey, Region 2. CERCLIS No. NJD980529192. Final report, 15:21900 (R;US)

Health assessment for Ge-Moreau, South Glen Falls, New York, Region 2. CERCLIS No. NYD980052335. Final report, 15:22668 (R;US)

Health assessment for General Electric Wiring Devices, Juana Diaz, Puerto Rico, Region 2. CERCLIS No. PRD090282757. Final report, 15:22573 (R;US)

Health assessment for General Motors Central Foundry, St. Lawrence County, Massena, New York, Region 2. CERCLIS No. NYD091972554. Preliminary report, 15:22667 (R;US)

Health assessment for Genzale Plating, Franklin Square, New York, Region 2. CERCLIS No. NYD002050110. Preliminary report, 15:22666 (R;US)

Health assessment for Goldisc Recording, Holbrook, New York, Region 2. CERCLIS No. NYD980768717. Preliminary report, 15:22665 (R;US)

Health assessment for Goose Farm National Priorities List (NPL) site, Plumsted Township, Ocean County, New Jersey, Region 2. CERCLIS No. NJD980530109. Final report, 15:22635 (R;US)

Health assessment for Griffiss Air Force Base NPL (National Priorities List) site, Rome, Oneida County, New York, Region 2. CERCLIS No. NY4571924451. Final report, 15:22664 (R;US)

Health assessment for Haviland Complex National Priorities List (NPL) site, Hyde Park, New York, Region 2. CERCLIS No. NYD980785661. Final report, 15:22663 (R;US)

Health assessment for Hercules Inc., Gibbstown, Glocester County, New Jersey, Region 2. CERCLIS No. NJD002349058. Preliminary report, 15:22636 (R;US)

Health assessment for Hertel Landfill Inc., Ulster County, Plattekill, New York, Region 2. CERCLIS No. NYD980780779. Preliminary report, 15:22662 (R;US)

Health assessment for Hooker Chemical (102nd Street Landfill), Niagara Falls, New York, Region 2. CERCLIS No. NYD980506810. Preliminary report, 15:22661 (R;US)

Health assessment for Hooker/Ruco, Hicksville, New York, Region 2. CERCLIS No. NYD002920312. Preliminary report, 15:22566 (R;US)

Health assessment for Horstmann's Dump, East Hanover, New Jersey, Region 2. CERCLIS No. NJD981084577. Preliminary report, 15:22556 (R;US)

Health assessment for Hudson River PCB (polychlorinated biphenyl) NPL (National Priorities List) site, State of New York, Region 2. CERCLIS No. NYD980763841. Final report, 15:22659 (R;US)

Health assessment for Hyde Park Landfill National Priorities List (NPL) site, Niagara Falls, New York, Region 2. CERCLIS No. NYD000831644. Final report, 15:22660 (R;US)

Health assessment for Islip Sanitary Landfill, Suffolk County, New York, Region 2. CERCLIS No. NYD980506901. Preliminary report, 15:22658 (R;US)

Health assessment for Johnstown City Landfill, Fulton County, Johnstown, New York, Region 2. CERCLIS No. NYD980506927. Preliminary report, 15:22677 (R;US)

Health assessment for Jones Sanitation Landfill (Jones Septic Site), Hyde Park, Dutchess County, New York, Region 2. CERCLIS No. NYD980534556. Preliminary report, 15:22572 (R;US)

Health assessment for Juncos Landfill, Juncos, Puerto Rico, Region 2. CERCLIS No. PRD980512362. Final report, 15:22529 (R;US)

Health assessment for Kentucky Avenue Wellfield National Priorities List (NPL) site, Horseheads, Chemung County, New York, Region 2. CERCLIS No. NYD981560428. Final report, 15:22678 (R;US)

Health assessment for Kin-Buc Landfill, Edison Township, New Jersey, Region 2. CERCLIS No. NJD049860836. Final report, 15:22637 (R;US)

Health assessment for Lang Property National Priorities List (NPL) site, Pemberton Township, Burlington County, New Jersey, Region 2. CERCLIS No. NJD980505382. Final report, 15:22638 (R;US)

Health assessment for Liberty Industrial Finishing, Nassau County, Farmingdale, New York, Region 2. CERCLIS No. NYD000337295. Preliminary report, 15:22679 (R;US)

Health assessment for Lone Pine Landfill National Priorities List (NPL) site, Freehold, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD980505424. Final report, 15:22639 (R;US)

Health assessment for Ludlow Landfill National Priorities List (NPL) site, Clayville, Oneida County, New York, Region 2. CERCLIS No. NYD013468939. Final report, 15:22680 (R;US)

Health assessment for Malta Rocket Test Site, Saratoga County, Malta, New York, Region 2. CERCLIS No. NYD980535124. Preliminary report, 15:22681 (R;US)

Health assessment for Mannheim Avenue Dump, Galloway Township, New Jersey, Region 2. CERCLIS No. NJD980654180. Preliminary report, 15:22641 (R;US)

Health assessment for Marathon Battery, Cold Springs, New York, Region 2. CERCLIS No. NYD001959757. Preliminary report, 15:22571 (R;US)

Health assessment for Matlack, Incorporated, Swedesboro, Gloucester County, New Jersey, Region 2. CERCLIS No. NJD043584101. Preliminary report, 15:22640 (R;US)

Health assessment for Monroe Township Landfill, Monroe, New Jersey, Region 2. CERCLIS No. NJD980505671. Preliminary report, 15:22642 (R;US)

Health assessment for Montgomery Township Housing Development, Montgomery, New Jersey, Region 2. CERCLIS No. NJD980654164. Final report, 15:22643 (R;US)

Health assessment for Myers Property, Franklin Township, New Jersey, Region 2. CERCLIS No. NJD980654198. Preliminary report, 15:22557 (R;US)

Health assessment for N.L. Industries, Inc., Pedricktown, New Jersey, Region 2. CERCLIS No. NJD061843249. Preliminary report, 15:22647 (R;US)

Health assessment for Nascolite Corporation, Millville, New Jersey, Region 2. CERCLIS No. NJD002362705. Final report, 15:22644 (R;US)

Health assessment for Naval Air Engineering Center, Lakehurst, Ocean County, New Jersey, Region 2. CERCLIS No. NJ7170023744. Preliminary report, 15:22645 (R;US)

Health assessment for Naval Weapons Station-Site A, Colts Neck, New Jersey, Region 2. CERCLIS No. NJ0170022172. Preliminary report, 15:22646 (R;US)

Health assessment for Nepera Chemical Co., Orange County, Maybrook, New York, Region 2. CERCLIS No. NYD000511451. Preliminary report, 15:22682 (R;US)

Health assessment for Niagara County Refuse Disposal, Niagara County, New York, Region 2. CERCLIS No. NYD000514257. Preliminary report, 15:22683 (R;US)

Health assessment for North Sea Landfill, Suffolk County, North Sea, New York, Region 2. CERCLIS No. NYD980762520. Preliminary report, 15:22684 (R;US)

Health assessment for Olean Well Field National Priorities List (NPL) site, Olean Cattaraugus County, New York, Region 2. CERCLIS No. NYD980528657. Final report, 15:22685 (R;US)

Health assessment for PJP Landfill, Judson County, Jersey City, New Jersey, Region 2. CERCLIS No. NJD980505648. Preliminary report, 15:22648 (R;US)

Health assessment for Pasley Solvents and Chemical, Garden City, New York, Region 2. CERCLIS No. NYD991292004. Preliminary report, 15:22575 (R;US)

Health assessment for Pijak Farm, Plumsted Township, New Jersey, Region 2. CERCLIS No. NJD980532808. Final report, 15:22558 (R;US)

Health assessment for Port Washington Landfill, North Hempstead, New York, Region 2. CERCLIS No. NYD980654206. Preliminary report, 15:22703 (R;US)

Health assessment for RCA del Caribe, Inc., Barceloneta, Puerto Rico, Region 2. CERCLIS No. PRD090370537. Preliminary report, 15:22687 (R;US)

Health assessment for Ramapo Town Landfill, Rockland County, Ramapo, New York, Region 2. CERCLIS No. NYD000511493. Preliminary report, 15:22702 (R;US)

Health assessment for Reich Farm National Priorities List (NPL) site, Pleasant Plains, Ocean County, New Jersey, Region 2. CERCLIS No. NJD980529713. Final report, 15:22559 (R;US)

Health assessment for Renora Site, Edison Township (bonhantown), New Jersey, Region 2. CERCLIS No. NJD070415005. Final report, 15:22649 (R;US)

Health assessment for Ringwood Mines/Landfill National Priorities List (NPL) site, Ringwood, Passaic County, New Jersey, Region 2. CERCLIS No. NJD980529739. Final report, 15:22650 (R;US)

Health assessment for Robintech Site, Broome County, Vestal, New York, Region 2. CERCLIS No. NYD002232957. Preliminary report, 15:22700 (R;US)

Health assessment for Rockaway Borough Well Field National Priorities List (NPL) site, Borough of Rockaway, Morris County, New Jersey, Region 2. CERCLIS No. NJD980654115. Final report, 15:22651 (R;US)

Health assessment for Rocky Hill Municipal Wellfield, Rocky Hill, New Jersey, Region 2. CERCLIS No. NJD980654156. Final report, 15:22652 (R;US)

Health assessment for Rowe Industries, Suffolk County, Sag Harbor, New York, Region 2. CERCLIS No. NYD981486954. Preliminary report, 15:22699 (R;US)

Health assessment for S-Area Landfill/Hooker, Niagara Falls, New York, Region 2. CERCLIS No. NYD000000001. Preliminary report, 15:22567 (R;US)

Health assessment for SMS Instruments, Inc., Deer Park, New York, Region 2. CERCLIS No. NYD001533165. Preliminary report, 15:22696 (R;US)

Health assessment for Sarney Property, Amenia, New York, Region 2. CERCLIS No. NYD980535165. Preliminary report, 15:22698 (R;US)

Health assessment for Sayreville Landfill, Middlesex County, Sayreville, New Jersey, Region 2. CERCLIS No. NJD980505754. Preliminary report, 15:22653 (R;US)

Health assessment for Scientific Chemical Processing, Carlstadt, Bergen County, New Jersey, Region 2. CERCLIS No. NJD070565403. Preliminary report, 15:22560 (R;US)

Health assessment for Sharkey Landfill, Troy Hills, New Jersey, Region 2. CERCLIS No. NJD980505762. Final report, 15:22654 (R;US)

Health assessment for Shieldalloy Corporation, Newfield Borough, Gloucester County, New Jersey, Region 2. CERCLIS No. NJD002365930. Preliminary report, 15:22655 (R;US)

Health assessment for Sinclair Refinery, Allegany County, Wellsville, New York, Region 2. CERCLIS No. NYD980535125. Preliminary report, 15:22697 (R;US)

Health assessment for Solvent Savers, Chenango County, Lincklaen, New York, Region 2. CERCLIS No. NYD980421176. Preliminary report, 15:22695 (R;US)

Health assessment for Spence Farm, Ocean County, Plumsted Township, New Jersey, Region 2. CERCLIS No. NJD980532816. Final report, 15:22561 (R;US)

Health assessment for Suffern Well Field NPL (National Priorities List) site, Village of Suffern, Rockland County, New York, Region 2. CERCLIS No. NYD980780878. Final report, 15:22694 (R;US)

Health assessment for Swope Oil Company, Pennsauken, Camden County, New Jersey, Region 2. CERCLIS No. NJD041743220. Final report, 15:22562 (R;US)

Health assessment for Syosset Landfill, Nassau County, Syosset, New York, Region 2. CERCLIS No. NYD000511360. Preliminary report, 15:22693 (R;US)

Health assessment for Tabernacle Drum Dump National Priorities List (NPL) site, Tabernacle Township, Burlington County, New Jersey, Region 2. CERCLIS No. NJD980761357. Final report, 15:22656 (R;US)

Health assessment for Tronic Plating Co. Inc., Suffolk County, Farmingdale, New York, Region 2. CERCLIS No. NYD002059517. Preliminary report, 15:22692 (R;US)

Health assessment for US Radium-West Orange, Orange, Essex County, New Jersey, Region 2. CERCLIS No. NJD980654172. Preliminary report, 15:21519 (R;US)

Health assessment for Universal Oil Products National Priorities List (NPL) site, East Rutherford, New Jersey, Region 2. CERCLIS No. NJD002005106. Preliminary report, 15:22563 (R;US)

Health assessment for Vega Alta Public Supply Wells Site, Vega Alta, Puerto Rico, Region 2. CERCLIS No. PRS187147. Final report, 15:22686 (R;US)

Health assessment for Ventron/Velsicol, Wood-Ridge Borough, Bergen County, New Jersey, Region 2. CERCLIS No. NJD980529879. Preliminary report, 15:22564 (R;US)

Health assessment for Volney Landfill, Volney, New York, Region 2. CERCLIS No. NYD980509376. Final report, 15:22691 (R;US)

Health assessment for Waldick Aerospace Devices, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD054981337. Final report, 15:22565 (R;US)

Health assessment for Warwick Landfill, Orange County, Warwick, New York, Region 2. CERCLIS No. NYD980506679. Preliminary report, 15:22690 (R;US)

Health assessment for Woodland Route 532 Dump, Woodland Township, Burlington County, New Jersey, Region 2. CERCLIS No. NJD980505887. Preliminary report, 15:22657 (R;US)

Health assessment for Woodlands Route 72 Dump, Woodland Township, Burlington County, New Jersey, Region 2. Cerclis No. NJD980505879. Preliminary report, 15:22617 (R;US)

Health assessment for York Oil Company, Moira, New York, Region 2. CERCLIS No. NYD000511733. Final report, 15:22689 (R;US)

Health assessment for richardson Hill Landfill, Delaware County, Sidney, New York, Region 2. CERCLIS No. NYD980507735. Preliminary report, 15:22701 (R;US)

Health assessment for the Endicott Wellfield Site, Broome County, New York, Region 2. CERCLIS No. NYD980780746. Final report, 15:22675 (R;US)

Risk Assessment

A review of the literature on the toxicity of rare-earth metals as it pertains to the engineering demonstration system surrogate testing: Revision 1, 15:22129 (R;US)

Water Pollution

Health assessment for Applied Environmental Services, Glenwood Landing, New York, Region 2. CERCLIS No. NYD980535652. Preliminary report, 15:22568 (R;US)

ENVIRONMENTAL EXPOSURE PATHWAY

Analysis of proposed post-closure alternatives for the Bear Creek Burial Grounds, 15:21515 (R;US)

Reports from the RIVM 1987, 15:22737 (R;NL;In Dutch)

ENVIRONMENTAL IMPACT STATEMENTS

Implementation plan for the new production reactor capacity environmental impact statement, 15:22544 (R;US)

ENVIRONMENTAL IMPACTS
Annual report of the Committee for the environment-effect-reporting for the year 1988, 15:21744 (R;NL;In Dutch)
Environmental hazards of pyroclastic flows determined by numerical models, 15:22801 (J;US)
Environmental sciences division long-range plan: FY 1990 to FY 1994, 15:22552 (R;US)
Remediation of contaminated soil using heap leach mining technology, 15:21496 (R;US)

Finite-element model of ultrasonic NDE [nondestructive evaluation], 15:22109 (R;US)

ERBIUM 162
The effective moment of inertia in ^{124}Xe, ^{126}Ba, ^{128}Ba, ^{129}Ce, ^{131}Ce and ^{162}Er isotopes, 15:22917 (R;FR)

ERBIUM OXIDES
Thermodynamic properties of some metal oxide-zirconia systems, 15:22152 (R;US)

ESERINE
Molecular probes for elucidating mechanisms of action of chemical threat agents. Annual report, 15 February 1988-14 February 1989, 15:22490 (R;US)

ESTUARIES
Small scale patches of suspended matter and phytoplankton in the Elbe river estuary, German Bight and tidal flats, 15:22600 (R;DE)

ESTUARINE ECOSYSTEMS
See AQUATIC ECOSYSTEMS

ETHANE
Mechanisms for the homogeneous, thermal conversion for methane to ethane and other saturated hydrocarbons: Volumes 1 and 2, 15:21594 (R;CA)
Synthesis for materials for reversible uptake and useful functionalization of methane. Annual report, January-December 1988, 15:21374 (R;GB)

ETHANOL
Combustion and performance characteristics of methanol plus higher alcohols in a spark ignition engine, 15:22090 (B;US)
Process development of an integrated extractive fermentation system: Part of the Bioenergy Development Program (BDP), 15:21584 (R;CA)

ETHANOL PLANTS
Process development of an integrated extractive fermentation system: Part of the Bioenergy Development Program (BDP), 15:21584 (R;CA)

ETHINE
See ACETYLENE

ETHOCEL
See CELLULOSE

ETHYL ALCOHOL
See ETHANOL

ETHYLENE
Synthesis for materials for reversible uptake and useful functionalization of methane. Annual report, January-December 1988, 15:21374 (R;GB)

ETHYLENE POLYMERS
See POLYETHYLENES

ETHYNE
See ACETYLENE

EUROPEAN COAL AND STEEL COMMUNITY
See ECSC

EUROPIUM COMPOUNDS
Luminescence and energy transfer processes in rare earth compounds, 15:22176 (R;NL)

EVAPORATION
Bare soil evaporation at Kesterson Reservoir, Merced County, California: Estimation by physical and chemical methods, 15:22603 (R;US)

EWA REACTOR
The analysis of the probability of the brittle fracture of the reactor EWA construction elements, 15:21776 (R;PL;In Russian)

EXCHANGE (HEAT)
See HEAT TRANSFER

EXCITED STATES
Life-time measurements of nuclear excited states in low energy region using an LEPS, 15:22964 (RA;JP;In Japanese)

EXHAUST GASES
Current state of atmospheric fluidized-bed combustion technology, 15:21170 (R;US)
Heart-disease mortality among bridge and tunnel officers exposed to carbon monoxide, 15:22517 (R;US)
NIOSH (National Institute for Occupational Safety and Health) testimony on coal mine health research before the Subcommittee on Labor Standards, House Committee on Education and Labor, by Edward J. Baier, June 29, 1977, 15:21181 (R;US)
NIOSH (National Institute for Occupational Safety and Health) testimony on coal mining before the Subcommittee on Energy and Power, House Committee on Interstate and Foreign Commerce, by Hohn F. Finklea, May 26, 1977, 15:21180 (R;US)

EXHAUST SYSTEMS
The Deutz particulate trap system in a status report, 15:22082 (RA;CA)

EXPERIMENTAL DATA
Calculation of thermodynamic properties for monomeric U(IV) hydrolysis products at 298.15 K and zero ionic strength, 15:21499 (R;US)
EXPERT SYSTEMS
Hybrid Intelligent Perception System: Intelligent perception through combining Artificial Neural Networks and an Expert System, 15:23210 (R;US)
R&D plans for advanced computer and control technologies: Volume 3, Expert-systems technology assessment: Final report, 15:21656 (R;US)
EXPLOSIVES
See also CHEMICAL EXPLOSIVES
NUCLEAR EXPLOSIVES
Preliminary report on the feasibility of high-power electronic warfare (EW) using explosive energy sources, 15:22482 (R;AU)
EXPOSURE (RADIATION DOSES)
See RADIATION DOSES
EXTREMELY HIGH FREQUENCY RADIATION
See MICROWAVE RADIATION

F

F CODES
Estimation of nonfuel operation and maintenance costs for advanced circulating fluidized-bed and advanced natural gas-fired combined cycle power plants, 15:21669 (R;US)
F REGION
Plasma transport through the dayside cleft: A source of ionization patches in the polar cap, 15:22837 (R;US)
FABRY-PEROT INTERFEROMETER
Spatial imaging using confocal Fabry-Perot interferometers, 15:22456 (R;US)
FACILITIES (MILITARY)
See MILITARY FACILITIES
FACILITIES (NUCLEAR)
See NUCLEAR FACILITIES
FACILITIES (TEST)
See TEST FACILITIES
FAILURES
See also RUPTURES
Estimation of some stochastic models used in reliability engineering, 15:21727 (R;FI)
FALLOUT
See also FALLOUT DEPOSITS
Environmental Radiation Data: Report 53, January-March 1988. Quarterly report, 15:22521 (R;US)
Environmental Radiation Data: Report 54, April-June 1988. Quarterly report, 15:22522 (R;US)
FALLOUT DEPOSITS
The geochemistry of fallout plutonium in the North Atlantic: I. A pore water study in shelf, slope and deep-sea sediments, 15:22709 (J;US)
The geochemistry of fallout plutonium in the North Atlantic: II. $^{240}Pu/^{239}Pu$ ratios and their significance, 15:22708 (J;US)
FALLOUT PARTICULATES

SOUTH DAKOTA
Yakima River spring chinook enhancement study: Annual report FY 1988, 15:21605 (R;US)
FEDERAL REGION X
See also ALASKA
Final radon testing results for the Residential Standards Demonstration Progam, 15:21963 (R;US)
Global warming: A Northwest perspective: Proceedings, 15:22538 (R;US)
Yakima River spring chinook enhancement study: Annual report FY 1988, 15:21605 (R;US)
FEDERAL REPUBLIC OF GERMANY
Key themes in Soviet published sources on the Federal Republic of Germany, 15:22091 (R;US)
Small scale patches of suspended matter and phytoplankton in the Elbe river estuary, German Bight and tidal flats, 15:22600 (R;DE)
The German AF-Program status and final activities, 15:21746 (RA;US)
FEDERAL WATER POLLUTION CONTROL ACT
See CLEAN WATER ACT
FEED MATERIALS PRODUCTION CENTER
Biological and ecological site characterization of the Feed Materials Production Center, June 1986–June 1987, 15:21542 (R;US)
Feed Materials Production Center environmental monitoring annual report for 1988, 15:21541 (R;US)
FEEDBACK
Atmospheric Radiation Measurement Program plan: Executive Summary, 15:22499 (R;US)
FEEDING
Re-entry of starved plateau-phase Chinese hamster ovary cells into the replicative cycle, 15:22721 (RA;US)
FERMENTATION ALCOHOL
See ETHANOL
FERMILAB TEVATRON
HOLRED - a machine for the replay of holograms made in a large bubble chamber, 15:22449 (R;GB)
FERRIC COMPOUNDS
See IRON COMPOUNDS
FERRITIC STEELS
Environmentally assisted cracking in light water reactors, 15:21830 (RA;US)
FERROMAGNETIC MATERIALS
Microlaminated ferromagnetic composites for magnetic switching, 15:22339 (BA;US)
FERROUS COMPOUNDS
See IRON COMPOUNDS
FERTILE MATERIALS
URR [Unresolved Resonance Region] computer code: A code to calculate resonance neutron cross-section probability tables, Bondarenko self-shielding factors, and self-indication ratios for fissile and fertile nuclides, 15:22920 (R;US)
FEYNMAN DIAGRAM
New algorithms for one-loop integrals, 15:22911 (R;NL)
FIBERS
See also CARBON FIBERS
Technological tendency for recent monolithic refractory, 15:22146 (RA;JP;In Japanese)
FIBROBLASTS
Benzamide prevention of ultraviolet radiation-induced transformation as measured by anchorage-independent growth and absence of correlation with thymidine dimer formation and DNA repair, 15:22738 (R;US)
FIELD EFFECT TRANSISTORS
Use of RADFETS (Radiation-Sensitive Field Effect Transistor) in radiation dose measurement: Report on three lots prepared for the US Army. Final report, 18 June 1987-18 September 1989, 15:22452 (R;GB)

FIELD EMISSION
La Jolla Institute workshop on novel ion sources and their applications, held in La Jolla California on August 3-4, 1981, 15:22843 (R;US)
FIELD THEORIES
See also QUANTUM FIELD THEORY
Lattice models and conformal field theories, 15:22908 (R;FR)
Level one Kac-Moody characters and modular invariance, 15:22907 (R;FR)
FIELDS (MAGNETIC)
See MAGNETIC FIELDS
FILM DOSIMETRY
High-energy neutron dosimetry at the Clinton P. Anderson Meson Physics Facility, 15:22753 (R;US)
FILTERS (ELECTRIC)

Incineration of creosote and pentachlorophenol wood-preserving waste-water-treatment sludges. Report for October 1986-September 1989, 15:22051 (R;US)
Sanitary Landfills
Health assessment for PJP Landfill, Judson County, Jersey City, New Jersey, Region 2. CERCLIS No. NJD980505648. Preliminary report, 15:22648 (R;US)
Silicon Oxides
Walk-through survey report, control technology support for sensor at Alloy-Tech, Inc., Delran, New Jersey, February 27, 1989, 15:22516 (R;US)
Walk-through survey report, control technology support for sensor at General Foundry Company, Flagtown, New Jersey, March 1, 1989, 15:22515 (R;US)
Walk-through survey report, control technology support for sensor at Ingersoll-Rand Company, Foundry Division, Phillipsburg, New Jersey, March 2, 1989, 15:22514 (R;US)
Waste Disposal
A demonstration of the applicability of implementing the enhanced Remedial Action Priority System (RAPS) for environmental releases, 15:21522 (R;US)
Hazardous materials waste disposal. June 1987-May 1989 (Citations from the NTIS data base). Report for June 1987-May 1989, 15:22060 (R;US)
Hazardous materials waste disposal. June 1989-January 1990 (Citations from the NTIS data base). Report for June 1989-January 1990, 15:22061 (R;US)
Remedial investigations for quarry bulk wastes: Revision 1, 15:21472 (R;US)

Resource conservation and recovery act activities for treatment, storage, and/or disposal units operating at the Hanford Site, 15:21534 (R;US)

Waste Management
Minutes from Department of Energy Hazardous Waste Remedial Actions Program Technology Demonstration Program FY 1990 waste site review and ranking meeting, 15:21465 (R;US)

Waste Storage
Resource conservation and recovery act activities for treatment, storage, and/or disposal units operating at the Hanford Site, 15:21534 (R;US)

Water Pollution
Health assessment for Naval Air Engineering Center, Lakehurst, Ocean County, New Jersey, Region 2. CERCLIS No. NJ7170023744. Preliminary report, 15:22645 (R;US)
Health assessment for Reich Farm National Priorities List (NPL) site, Pleasant Plains, Ocean County, New Jersey, Region 2. CERCLIS No. NJD980529713. Final report, 15:22559 (R;US)
Health assessment for Rockaway Borough Well Field National Priorities List (NPL) site, Borough of Rockaway, Morris County, New Jersey, Region 2. CERCLIS No. NJD980654115. Final report, 15:22651 (R;US)
Health assessment for Rocky Hill Municipal Wellfield, Rocky Hill, New Jersey, Region 2. CERCLIS No. NJD980654156. Final report, 15:22652 (R;US)
Health assessment for Sarney Property, Amenia, New York, Region 2. CERCLIS No. NYD980535165. Preliminary report, 15:22698 (R;US)
Health assessment for Shieldalloy Corporation, Newfield Borough, Gloucester County, New Jersey, Region 2. CERCLIS No. NJD002365930. Preliminary report, 15:22655 (R;US)
Health assessment for the Endicott Wellfield Site, Broome County, New York, Region 2. CERCLIS No. NYD980780746. Final report, 15:22675 (R;US)

INCINERATION
See COMBUSTION

INCINERATORS
Computer simulation of a municipal solid waste combustor, 15:22076 (J;US)
Incineration of creosote and pentachlorophenol wood-preserving waste-water-treatment sludges. Report for October 1986-September 1989, 15:22051 (R;US)
Operating and emission guidelines for municipal solid waste incinerators, 15:22072 (R;CA)
PREPP [Process Experimental Pilot Plant] operating experience and status, 15:21488 (R;US)
Partitioning of metals in rotary-kiln incineration, 15:22052 (R;US)
Solid-waste incinerators. September 1970-October 1989 (Citations from the US Patent data base). Report for September 1970-October 1989, 15:22054 (R;US)

INCLUSION COMPLEXES
See CLATHRATES

INCOLOY 800
Corrosion assessment in FBC [fluidized-bed combustion] systems, 15:21165 (R;US)

INDIA
Heavy oils of India and the problems in their production, 15:21210 (RA;US)
Occurrence of heavy crude oil in Cambay Basin, India, 15:21187 (RA;US)

INDICATOR SPECIES
See BIOLOGICAL INDICATORS

INDIUM
Synchrotron photoemission studies of surfaces and overlayers, 15:22193 (BA;US)

INDIUM 111
Calculations of Auger-cascade-induced reactions with DNA in aqueous solution, 15:22750 (R;US)

INDIUM ARSENIDES
Studies of an InAs/GaAs heterojunction by total-electron-yield, 15:22970 (BA;US)

INDIUM OXIDES
Indium-tin oxide films. January 1976-January 1990 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for January 1976-January 1990, 15:22328 (R;US)

INDIUM PHOSPHIDE SOLAR CELLS
The photovoltaic properties of an Al In As/InP heterojunctions grown by LPE method. Final technical report, 15:21617 (R;US)

INDIUM SELENIDES
$CuInSe_2$ and CdTe: Scale-up for manufacturing, 15:21622 (R;US)

INDONESIA
The occurrences of heavy crude and tar sands in Indonesia, 15:21188 (RA;US)

INDOOR AIR POLLUTION
A method for estimating annual dose equivalent to the lung under varying radon progeny conditions, 15:21969 (R;US)
Byssinosis and small airways disease: Terminal progress report, 15:22733 (R;US)
Final radon testing results for the Residential Standards Demonstration Progam, 15:21963 (R;US)
Indoor air quality simulation: IAQPC [Indoor air quality simulator for personal computer], 15:22015 (RA;CA)
Indoor radon pollution: Control and mitigation. June 1978-December 1989 (Citations from the NTIS data base). Report for June 1978-December 1989, 15:22534 (R;US)
Predictions of thermal comfort and pollutant distribution for a thermostatically-controlled, air-conditioned, partitioned room: Numerical results and enhanced graphical presentation, 15:22012 (RA;CA)
The cost of increased ventilation air, 15:22011 (RA;CA)

INDUCED RADIOACTIVITY

INDUSTRIAL WASTES
Air Pollution
Health assessment for CPS/Madison Industries, Old Bridge Township, Middlesex County, New Jersey, Region 2. CERCLIS No. NJD002141190. Preliminary report, 15:22627 (R;US)

Environmental Exposure
Health assessment for Sinclair Refinery, Allegany County, Wellsville, New York, Region 2. CERCLIS No. NYD980535125. Preliminary report, 15:22697 (R;US)

Ground Disposal
Health assessment for Byron Barrel, Genesee County, Byron, New York, Region 2. CERCLIS No. NYD980780670. Preliminary report, 15:22671 (R;US)
Health assessment for Lang Property National Priorities List (NPL) site, Pemberton Township, Burlington County, New Jersey, Region 2. CERCLIS No. NJD980505382. Final report, 15:22638 (R;US)
Health assessment for Niagara County Refuse Disposal, Niagara County, New York, Region 2. CERCLIS No. NYD000514257. Preliminary report, 15:22683 (R;US)

Land Pollution
Health assessment for Anchor Lith Kemko, Hicksville, New York, Region 2. CERCLIS No. NYD001485226. Preliminary report, 15:22672 (R;US)
Health assessment for Applied Environmental Services, Glenwood Landing, New York, Region 2. CERCLIS No. NYD980535652. Preliminary report, 15:22568 (R;US)
Health assessment for Bog Creek Farm Site (BCFS) National Priorities List (NPL) site, Howell Township, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD063157150. Final report, 15:22619 (R;US)
Health assessment for Chemical Leaman Tank Lines, Inc. (CLTL) NPL (National Oriorities List) site, Logan Township, Gloucester County, New Jersey, Region 2. CERCLIS No. NJD047321443. Final report, 15:22622 (R;US)
Health assessment for Ciba-Geigy National Priorities List (NPL) site, Dover Township, Ocean County, New Jersey, Region 2. CERCLIS No. NJD00150217. Final report, 15:22624 (R;US)
Health assessment for Derewal Chemical Company National Priorities List (NPL) site, Kingwood Township, Hunterdon County, New Jersey, Region 2. CERCLIS No. NJD980761373. Preliminary report, 15:22630 (R;US)
Health assessment for Diamond Alkali/80 Lister Avenue, Newark, New Jersey, Region 2. CERCLIS No. NJD980528996. Final report, 15:22631 (R;US)
Health assessment for Facet Enterprises, Inc., Chemung County, Elmira Heights, New York, Region 2. CERCLIS No. NYD073675514. Preliminary report, 15:22676 (R;US)
Health assessment for Fairlawn Wellfield, Fairlawn, New Jersey, Region 2. CERCLIS No. NJD980654107. Preliminary report, 15:22633 (R;US)
Health assessment for Fibers Public Supply Wells, Guayama, Puerto Rico, Region 2. CERCLIS No. PRD980763783. Preliminary report, 15:22574 (R;US)
Health assessment for Fulton Terminals Site, Fulton, New York, Region 2. CERCLIS No. NYD980593099. Final report, 15:22669 (R;US)
Health assessment for General Motors Central Foundry, St. Lawrence County, Massena, New York, Region 2. CERCLIS No. NYD091972554. Preliminary report, 15:22667 (R;US)
Health assessment for Genzale Plating, Franklin Square, New York, Region 2. CERCLIS No. NYD002050110. Preliminary report, 15:22666 (R;US)
Health assessment for Goldisc Recording, Holbrook, New York, Region 2. CERCLIS No. NYD980768717. Preliminary report, 15:22665 (R;US)
Health assessment for Goose Farm National Priorities List (NPL) site, Plumsted Township, Ocean County, New Jersey, Region 2. CERCLIS No. NJD980530109. Final report, 15:22635 (R;US)
Health assessment for Hooker/Ruco, Hicksville, New York, Region 2. CERCLIS No. NYD002920312. Preliminary report, 15:22566 (R;US)
Health assessment for Marathon Battery, Cold Springs, New York, Region 2. CERCLIS No. NYD001959757. Preliminary report, 15:22571 (R;US)
Health assessment for Matlack, Incorporated, Swedesboro, Gloucester County, New Jersey, Region 2. CERCLIS No. NJD043584101. Preliminary report, 15:22640 (R;US)
Health assessment for Myers Property, Franklin Township, New Jersey, Region 2. CERCLIS No. NJD980654198. Preliminary report, 15:22557 (R;US)
Health assessment for N.L. Industries, Inc., Pedricktown, New Jersey, Region 2. CERCLIS No. NJD061843249. Preliminary report, 15:22647 (R;US)
Health assessment for Nascolite Corporation, Millville, New Jersey, Region 2. CERCLIS No. NJD002362705. Final report, 15:22644 (R;US)
Health assessment for Pasley Solvents and Chemical, Garden City, New York, Region 2. CERCLIS No. NYD991292004. Preliminary report, 15:22575 (R;US)
Health assessment for Renora Site, Edison Township (bonhantown), New Jersey, Region 2. CERCLIS No. NJD070415005. Final report, 15:22649 (R;US)
Health assessment for Scientific Chemical Processing, Carlstadt, Bergen County, New Jersey, Region 2. CERCLIS No. NJD070565403. Preliminary report, 15:22560 (R;US)
Health assessment for Sinclair Refinery, Allegany County, Wellsville, New York, Region 2. CERCLIS No. NYD980535125. Preliminary report, 15:22697 (R;US)
Health assessment for Solvent Savers, Chenango County, Lincklaen, New York, Region 2. CERCLIS No. NYD980421176. Preliminary report, 15:22695 (R;US)
Health assessment for Spence Farm, Ocean County, Plumsted Township, New Jersey, Region 2. CERCLIS No. NJD980532816. Final report, 15:22561 (R;US)
Health assessment for Swope Oil Company, Pennsauken, Camden County, New Jersey, Region 2. CERCLIS No. NJD041743220. Final report, 15:22562 (R;US)
Health assessment for Tronic Plating Co. Inc., Suffolk County, Farmingdale, New York, Region 2. CERCLIS No. NYD002059517. Preliminary report, 15:22692 (R;US)
Health assessment for Universal Oil Products National Priorities List (NPL) site, East Rutherford, New Jersey, Region 2. CERCLIS No. NJD002005106. Preliminary report, 15:22563 (R;US)
Health assessment for Ventron/Velsicol, Wood-Ridge Borough, Bergen County, New Jersey, Region 2. CERCLIS No. NJD980529879. Preliminary report, 15:22564 (R;US)
Health assessment for Waldick Aerospace Devices, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD054981337. Final report, 15:22565 (R;US)

Sanitary Landfills
Health assessment for Claremont Poly Chemical Corp., Nassau County, Old Bethpage, New York, Region 2. CERCLIS No. NYD002044584. Preliminary report, 15:22673 (R;US)
Health assessment for Hooker Chemical (102nd Street Landfill), Niagara Falls, New York, Region 2. CERCLIS No. NYD980506810. Preliminary report, 15:22661 (R;US)
Health assessment for Hyde Park Landfill National Priorities List (NPL) site, Niagara Falls, New York, Region 2. CERCLIS No. NYD000831644. Final report, 15:22660 (R;US)
Health assessment for SMS Instruments, Inc., Deer Park, New York, Region 2. CERCLIS No. NYD001533165. Preliminary report, 15:22696 (R;US)
Health assessment for richardson Hill Landfill, Delaware County, Sidney, New York, Region 2. CERCLIS No. NYD980507735. Preliminary report, 15:22701 (R;US)

Settling Ponds

Health assessment for RCA del Caribe, Inc., Barceloneta, Puerto Rico, Region 2. CERCLIS No. PRD090370537. Preliminary report, 15:22687 (R;US)

Solid Wastes

Cyanide in MGP (manufactured gas plant) wastes: Investigation of analytical methods. Topical report, January 1988-June 1989, 15:21577 (R;US)

Waste Processing

Metals recovery from wastes. May 1988-December 1989 (Citations from the COMPENDEX data base). Report for May 1988-December 1989, 15:22057 (R;US)

Waste Water

Incineration of creosote and pentachlorophenol wood-preserving waste-water-treatment sludges. Report for October 1986-September 1989, 15:22051 (R;US)

Water Pollution

Health assessment for Anchor Lith Kemko, Hicksville, New York, Region 2. CERCLIS No. NYD001485226. Preliminary report, 15:22672 (R;US)

Health assessment for Bog Creek Farm Site (BCFS) National Priorities List (NPL) site, Howell Township, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD063157150. Final report, 15:22619 (R;US)

Health assessment for CPS/Madison Industries, Old Bridge Township, Middlesex County, New Jersey, Region 2. CERCLIS No. NJD002141190. Preliminary report, 15:22627 (R;US)

Health assessment for Chemical Leaman Tank Lines, Inc. (CLTL) NPL (National Oriorities List) site, Logan Township, Gloucester County, New Jersey, Region 2. CERCLIS No. NJD047321443. Final report, 15:22622 (R;US)

Health assessment for Ciba-Geigy National Priorities List (NPL) site, Dover Township, Ocean County, New Jersey, Region 2. CERCLIS No. NJD00150217. Final report, 15:22624 (R;US)

Health assessment for Derewal Chemical Company National Priorities List (NPL) site, Kingwood Township, Hunterdon County, New Jersey, Region 2. CERCLIS No. NJD980761373. Preliminary report, 15:22630 (R;US)

Health assessment for Diamond Alkali/80 Lister Avenue, Newark, New Jersey, Region 2. CERCLIS No. NJD980528996. Final report, 15:22631 (R;US)

Health assessment for Facet Enterprises, Inc., Chemung County, Elmira Heights, New York, Region 2. CERCLIS No. NYD073675514. Preliminary report, 15:22676 (R;US)

Health assessment for Fairlawn Wellfield, Fairlawn, New Jersey, Region 2. CERCLIS No. NJD980654107. Preliminary report, 15:22633 (R;US)

Health assessment for Fibers Public Supply Wells, Guayama, Puerto Rico, Region 2. CERCLIS No. PRD980763783. Preliminary report, 15:22574 (R;US)

Health assessment for Fulton Terminals Site, Fulton, New York, Region 2. CERCLIS No. NYD980593099. Final report, 15:22669 (R;US)

Health assessment for General Motors Central Foundry, St. Lawrence County, Massena, New York, Region 2. CERCLIS No. NYD091972554. Preliminary report, 15:22667 (R;US)

Health assessment for Genzale Plating, Franklin Square, New York, Region 2. CERCLIS No. NYD002050110. Preliminary report, 15:22666 (R;US)

IODINE 131
Study of transitional nuclei at TRISTAN: Progress report, 15:22929 (R;US)
ION BEAM TARGETS
Final focusing of Z-discharge transported ion beams, 15:23170 (BA;US)
Theoretical analysis of wire-guided ion beam transport, 15:23169 (BA;US)
ION BEAMS
See also BERYLLIUM 7 BEAMS
Collective ion acceleration in high current relativistic electron beams: Annual report, 15:22366 (R;US)
La Jolla Institute workshop on novel ion sources and their applications, held in La Jolla California on August 3-4, 1981, 15:22843 (R;US)
Physical sputtering of metallic systems by charged-particle impact, 15:22104 (R;US)
Progress in ion beam research at Sandia National Laboratories, 15:23168 (BA;US)
Radioactive beam production at the Bevalac, 15:22372 (R;US)
Software quality assurance and software safety in the Biomed Control System, 15:22725 (R;US)
ION CLUSTERS
See ION PAIRS

ION COLLISIONS
See also ION-MOLECULE COLLISIONS
Doubly differential ionization cross sections for intermediate-velocity heavy ions, 15:22950 (RA;US)
Reactions of atmospheric species with clean and H, C, and O implanted species. Final report, 1 April 1986-15 July 1989, 15:22494 (R;US)

ION CYCLOTRON-RESONANCE HEATING
See ICR HEATING

ION EMISSION
Experimental study on the secondary emission (atomic and molecular ions, aggregates, electrons) induced by the bombardment of surfaces by means of energetic heavy ions (≈ MeV/u). Effects of the charge state of the projectiles, 15:22962 (R;FR;In French)

ION EXCHANGE MATERIALS
See also INORGANIC ION EXCHANGERS
Half-scale solidification experiment of spent ion exchange resins, 15:21535 (R;FI;In Finnish)

ION EXCHANGE MEMBRANES
See ION EXCHANGE MATERIALS
MEMBRANES

ION IMPLANTATION
Ion-beam modification of metals: Mechanical properties and structure. Final report, 15 August 1986-14 August 1989, 15:22097 (R;US)

ION PAIRS
Photoexcited charge pair escape recombination: Progress report, March 1–November 15, 1989, 15:22229 (R;US)

ION SOURCES
A new high temperature ion source for the KUR-ISOL facility, 15:21779 (RA;JP)
Center for Radiation Research (of the National Institute of Standards and Technology) technical activities for 1989, 15:21571 (R;US)
La Jolla Institute workshop on novel ion sources and their applications, held in La Jolla California on August 3-4, 1981, 15:22843 (R;US)
Low energy ion generator: Performance results and tests irradiation, 15:22854 (R;JP;In Japanese)
Multiply-charged ion emission from a cyclotron-resonance-heated plasma ion source, 15:21570 (R;US)
Present status of BNL polarized sources, 15:22378 (R;US)
System for programmable microtreatment by a focused ion beam, 15:22394 (R;SU;In Russian)
The BNL volume H^- ion source, 15:22377 (R;US)

ION WAVE INSTABILITY
Experimental investigation of hemispherical ion-beam modes, 15:23082 (BA;US)

ION-MOLECULE COLLISIONS
Structured ion impact: Doubly differential cross sections, 15:22860 (RA;US)
The time dependent Hartree-Fock calculation of ion-molecule scattering, 15:22867 (R;US)

IONIC REACTIONS
See CHEMICAL REACTIONS
IONS

IONIZATION
See also AUTOIONIZATION
Absolute pressure dependence of the second ionization level of EL2 in GaAs, 15:22965 (R;US)
Bethe-born theory of ionization by high-velocity ions and electrons, 15:22762 (RA;US)
Tables of average distributions of particles emitted by ionized elements (Z = 6–100), 15:22866 (R;US)

IONIZATION CALORIMETERS
See SHOWER COUNTERS

IONIZATION CHAMBERS
Calibration of non-parallel ionization chambers at high energy electron radiation, 15:22451 (RA;NL;In Dutch)

IONIZING RADIATIONS
See also COSMIC RADIATION
GAMMA RADIATION
X RADIATION
Bethe-born theory of ionization by high-velocity ions and electrons, 15:22762 (RA;US)
Center for Radiation Research (of the National Institute of Standards and Technology) technical activities for 1989, 15:21571 (R;US)

IONOSPHERE
See also F REGION
Auroral breakup during substorm onsets, 15:22842 (BA;US)
Center of excellence in theoretical geoplasma research. Final report, 1 October 1986-30 September 1989, 15:22839 (R;US)
Compressional Alfven waves in A B field gradient, 15:23086 (BA;US)
Two-dimensional mapping of dayside convection, 15:22838 (R;US)

IONS
See also CATIONS
COPPER IONS
FLUORINE IONS
HEAVY IONS
HELIUM IONS
IRON IONS
LITHIUM IONS
MULTICHARGED IONS
SILVER IONS
Microscopic dosimetry of ions in nanometer sites: Touchers, 15:22448 (RA;US)

IRIDIUM ALLOYS
Experimental evaluation of new alloy coatings. Final report, November 1986-January 1989, 15:22098 (R;US)

IRIDIUM COMPLEXES
The synthesis and reactivity of organoiridium complexes containing metal-heteroatom bonds, 15:22224 (R;US)

IRON
Ammonia-pretreatment-induced restructuring of iron single-crystal surfaces: Its effects of ammonia synthesis and on coadsorbed aluminum oxide and potassium, 15:21572 (J;US)
Compositional aspect of iron Fischer-Tropsch catalyst: An XPS/reaction study, 15:21143 (J;US)
L shell XANES [x-ray absorption near edge structure] for solid metals: Ti, V, Cr, Fe, Ni, Cu, 15:22865 (R;US)
Measurements of the charge state distribution and transport of iron impurity ions in TFTR plasmas by a multi-chord X-ray crystal spectrometer, 15:23006 (RA;XA)

IRON 54 TARGET
High spin levels populated in multinucleon transfer reaction with 480 MeV ^{12}C, 15:22933 (R;FR)

IRON 55
Calculations of Auger-cascade-induced reactions with DNA in aqueous solution, 15:22750 (R;US)

IRON ALLOYS
See also IRON BASE ALLOYS
Corrosion properties of Fe_3Al in H_2S-H_2-H_2O mixtures, 15:21120 (R;US)
Studies of the structure and properties of amorphous a-Ar76Fe24Hx, 15:22136 (R;US)

IRON BASE ALLOYS
See also STEELS
Environmental effects on corrosion in the Tuff repository, 15:21512 (R;US)
Identification of a cast iron alloy containing nonstrategic elements: Final report, 15:22080 (R;US)

IRON CARBIDES
Advances and future directions in superplastic materials, 15:22099 (RA;FR)

IRON COMPOUNDS
See also IRON CARBIDES
IRON OXIDES
Catalyst dispersion and activity under conditions of temperature-staged liquefaction: Technical progress report, October–December 1989, 15:21126 (R;US)

IRON IONS
A comparison of microscopic dose with average dose near high-energy iron ions, 15:22763 (RA;US)

IRON ISOTOPES
See also IRON 55
Nuclear structure effects in exciton level densities, 15:22928 (R;US)
IRON METEORITES
Copper and nickel partitioning in iron meteorites, 15:22803 (J;US)
IRON OXIDES
Valence band electronic structure of cleaved iron oxide single crystals studied by resonant photoemission, 15:22870 (BA;US)
IRRADIATION CAPSULES
Leakage of an irradiator source: The June 1988 Georgia RSI [Radiation Sterilizers, Inc.] incident, 15:22549 (R;US)
IRRIGATION
Improved selection procedures for irrigation sprinklers, 15:22043 (R;US)
ISOTOPE ENRICHMENT
See ISOTOPE SEPARATION
ISOTOPE SEPARATION
Development of lithium isotope separation process using crown compounds, 15:22222 (R;JP;In Japanese)
ISOTOPES
See also CHROMIUM ISOTOPES
COBALT ISOTOPES
COPPER ISOTOPES

ISOTOPIC SEPARATION
See ISOTOPE SEPARATION
ITER TOKAMAK
Engineering issues for plasma facing components of ITER, 15:23111 (RA;XA)
[Reactor shielding experiments and analysis]: Foreign trip report, February 10–16, 1990, 15:23137 (R;US)

J

J PSI-3097 MESONS
First observation of three pseudoscalar states in the J/ $\Psi \rightarrow \gamma \rho \rho$ decay, 15:22888 (R;FR)
J/ψ production and the di-muons in oxygen-copper collisions at 200 GeV/nucleon, 15:22884 (R;FR;In French)
Looking at CP invariance and quantum mechanics in J/$\Psi \rightarrow \Lambda$antiΛ decay, 15:22889 (R;FR)
J-3105 RESONANCES
See J PSI-3097 MESONS
JAILS
See PUBLIC BUILDINGS
JAPAN
Developing the inter-fuel competition model - an analysis of the structural changes of energy demand-supply in Japan, 15:21178 (R;JP)
JAPAN MATERIALS TESTING REACTOR
See JMTR REACTOR
JAPAN RESEARCH REACTOR-4
See JRR-4 REACTOR
JEJUNUM
See SMALL INTESTINE
JET REACTORS
See JET TOKAMAK
JET TOKAMAK
A comparison between beryllium and graphite as materials for JET limiters and wall surfaces, 15:23131 (R;GB)
A predictive equilibrium code for JET, 15:23052 (R;GB)
Gas release on venting the JET torus, 15:23054 (R;GB)
Impurity ion transport studies in the JET and DITE tokamaks, 15:23015 (RA;XA)
Impurity production and recycling in JET, 15:23001 (RA;XA)
Particle transport in pellet fueled JET [Jet European Torus] plasmas, 15:23139 (R;US)
JFT-2M TOKAMAK
Divertor plasma study in JFT-2M H-mode discharges, 15:23014 (RA;XA)
Edge phenomena of JFT-2M plasma, 15:22999 (RA;XA)
Impurity transport during H-mode phase in JFT-2M, 15:23016 (RA;XA)
Scaling study of scrape-off layer and divertor plasmas, 15:23002 (RA;XA)
JIPPT-2 DEVICE
Impurity problems related to ICRF heating on the JIPP T-IIU tokamak, 15:23009 (RA;XA)
JMTR REACTOR
Fuel core moderate enrichment uranium (MEU) fuel demonstration in the JMTR, 15:21763 (RA;US)
Post-irradiation examination of low-enrichment uranium (LEU) miniplates in the JMTR, 15:21754 (RA;US)
JOSEPHSON JUNCTIONS
High-quality tunnel-junction devices using high-T(c) superconductors, 15:22355 (P;US)
JRR-4 REACTOR
Irradiation and nuclear characteristics measurements of JRR-4 LEU fuel elements, 15:21757 (RA;US)
JT-60 REACTORS
See JT-60 TOKAMAK
JT-60 TOKAMAK
Behavior of light impurity in beam heated JT-60 plasmas with graphite walls, 15:23011 (RA;XA)
Current drive and sustain experiments with the bootstrap current in JT-60, 15:23051 (R;JP)
Divertor effects and confinement properties of JT-60 lower X-point divertor discharges, 15:23010 (RA;XA)
Heat flow to the divertor plates in JT-60 lower X-point discharges, 15:23005 (RA;XA)
Impurity characteristics in JT-60, 15:23017 (RA;XA)
Performance of JT-60 first wall, 15:23112 (RA;XA)
Program package for control system design and analysis (DPACS/J), 15:23048 (R;JP;In Japanese)
Radiation losses and global power balance of JT-60 plasmas, 15:23012 (RA;XA)
JUPITER PLANET
Jupiter's drifting decametric bursts with the changing time scale, 15:22810 (R;SU;In Russian)
Magnetospheric plasma physics, 15:22841 (R;GB)

K

K REACTOR
Safety issues at the defense production reactors: A report to the US Department of Energy, 15:21790 (R;US)
KAHL-MAIN REACTOR
See HDR REACTOR
KELVIN-HELMHOLTZ INSTABILITY
See HELMHOLTZ INSTABILITY
KEROGEN
Development of a detailed model of petroleum formation, destruction, and expulsion from lacustrine and marine source rocks, 15:21429 (R;US)
KILNS
PREPP [Process Experimental Pilot Plant] operating experience and status, 15:21488 (R;US)
KLYSTRONS
Modification of MEA modulator-klystron units enabling short pulse injection into a pulse-stretcher ring, 15:22395 (R;NL)
KNOCK-ON ELECTRONS
See ELECTRONS
KOREA (SOUTH)
See REPUBLIC OF KOREA
KRYPTON
A study of binary ion plasma expansion into laboratory generated plasma wakes, 15:23081 (BA;US)

KRYPTON FLUORIDE LASERS
Amplified spontaneous emission measurements on the aurora large-aperture module, 15:23132 (R;US)
KUCA REACTOR
Measurement and analysis on coupled cores in the KUCA, 15:21780 (RA;JP;In Japanese)
Study on temperature coefficient of reactivity in JUCA light-water moderated and reflected core effect of moderate/fuel ratio and core shape on this quantity, 15:21764 (RA;US)
KYOTO UNIVERSITY CRITICAL ASSEMBLY REACTOR
See KUCA REACTOR

L

L CODES
A menu-driven program for determining properties of aqueous lithium bromide solutions, 15:22050 (R;US)
L REACTOR
Safety issues at the defense production reactors: A report to the US Department of Energy, 15:21790 (R;US)
LA REINA REACTOR
See RESEARCH REACTORS
LAGRANGE FIELD EQUATIONS
See LAGRANGIAN FIELD THEORY
LAGRANGIAN FIELD THEORY
A Lagrangian reactive transport simulator with successive paths and stationary-states: Concepts, implementation and verification: Revision 1, 15:21525 (R;US)
LAKES
Anaerobic dechlorination of 2,4-dichlorophenol in freshwater sediments in the presence of sulfate, 15:22616 (R;US)
Chemical and biological data summary for Lake 222 outflow experiments (experimental lakes area) (May 1983), 15:22605 (R;CA)
Studies to determine whether the condition of fish from the lower Mackenzie River is related to hydrocarbon exposure, 15:21329 (R;CA)
LAMELLAE
Dependence of the breakdown strength on the lamella orientation at the semiconducting interface in improved XLPE power cables, 15:21863 (R;JP;In Japanese)
LAMINAR FLOW
Lubricated pipelining: Stability of core-annular flow. Part 2, 15:22278 (R;US)
LAND APPLICATION

Center for Radiation Research (of the National Institute of Standards and Technology) technical activities for 1989, 15:21571 (R;US)

MECHANICAL DECLADDING
SBR jacket cutters. Final report, 15:21455 (R;DE;In German)

MECHANICAL EFFECTS
See MECHANICAL PROPERTIES

MECHANICAL PROPERTIES
See also CREEP
FATIGUE
Ion-beam modification of metals: Mechanical properties and structure. Final report, 15 August 1986-14 August 1989, 15:22097 (R;US)
Mechanical behavior of whisker reinforced ceramics, 15:22141 (R;US)
Seismic characterization of fracture properties, 15:21502 (R;US)

MECHANICAL STRUCTURES
See also BRIDGES
INTAKE STRUCTURES
SUPPORTS
ASCE working group activities on stiffness of concrete shear wall structures, 15:21822 (RA;US)
Assessment of effects of structural response on plant risk and margin, 15:21823 (RA;US)

MECHANICAL VIBRATIONS
Conception and realization of an expert system to help the interpretation of the mechanical shocks in a nuclear power plant, 15:21726 (R;FR;In French)

MEDICINE
See also NUCLEAR MEDICINE
Laser-produced plasmas in medicine, 15:22754 (R;US)

MEDICINES
See DRUGS

MEMBRANES
Development of ceramic membranes for gas separation: FY 1989 development activities, 15:21133 (R;US)
Permeability of membranes fabricated at ORGDP [Oak Ridge Gaseous Diffusion Plant], 15:21137 (R;US)

MEMORY DEVICES
Genetic adaptive system for image understanding and learning research. Phase 1. Final technical report, 1 February-1 August 1989, 15:23206 (R;US)
The Livermore distributed storage system: Implementation and experiences, 15:23233 (R;US)

MEMORY MANAGEMENT
Overcoming Unix kernel deficiencies in a portable, distributed storage system, 15:23235 (R;US)
The Livermore distributed storage system: Implementation and experiences, 15:23233 (R;US)

MERCURY
Mercury monitoring of water and sediment in Oak Ridge National Laboratory streams during 1989, 15:22606 (R;US)
Synchrotron studies of x-ray reflectivity from surfaces, 15:22107 (R;US)
Toxicity of mercury and mercury compounds. May 1978-August 1989 (Citations from Pollution Abstracts). Report for May 1978-August 1989, 15:22774 (R;US)

MERCURY COMPOUNDS
Toxicity of mercury and mercury compounds. May 1978-August 1989 (Citations from Pollution Abstracts). Report for May 1978-August 1989, 15:22774 (R;US)

MERCURY IODIDES
Mercuric iodide room temperature gamma-ray detectors, 15:22429 (R;US)

MERCURY PLANET
Magnetospheric plasma physics, 15:22841 (R;GB)

METABOLIC DISEASES
Clinical results of stereotactic helium-ion radiosurgery of the pituitary gland at Lawrence Berkeley Laboratory, 15:22729 (R;US)

METABOLIC PATHWAYS
See BIOLOGICAL PATHWAYS

METAL CASTINGS
See CASTINGS

METAL INDUSTRY
Competitive position of natural gas: Ferrous-metal heat treating and atmosphere generation, February 1988, 15:21368 (R;US)
Health assessment for Shieldalloy Corporation, Newfield Borough, Gloucester County, New Jersey, Region 2. CERCLIS No. NJD002365930. Preliminary report, 15:22655 (R;US)
Walk-through survey report, control technology support for sensor at Alloy-Tech, Inc., Delran, New Jersey, February 27, 1989, 15:22516 (R;US)
Walk-through survey report, control technology support for sensor at General Foundry Company, Flagtown, New Jersey, March 1, 1989, 15:22515 (R;US)
Walk-through survey report, control technology support for sensor at Ingersoll-Rand Company, Foundry Division, Phillipsburg, New Jersey, March 2, 1989, 15:22514 (R;US)

METALLIC GLASSES
Studies of the structure and properties of amorphous a-Ar76Fe24Hx, 15:22136 (R;US)

METALLURGY
See also POWDER METALLURGY
Optical diagnostics for metallurgical processes, 15:22130 (BA;US)

METALS
See also ACTINIDES
ALKALI METALS
ALUMINIUM
ANTIMONY
GALLIUM
INDIUM
LEAD
LIQUID METALS
MERCURY
RARE EARTHS
REFRACTORY METALS
SCRAP METALS
TIN
TRANSITION ELEMENTS
Alloying of metals for corrosion resistance, 15:22135 (P;US)
Characteristics of metal oxide surge arrester elements under water absorption, 15:21852 (R;JP;In Japanese)
Crystal preparation at LBL 1976 to 1986, 15:22121 (R;US)
Ion-beam modification of metals: Mechanical properties and structure. Final report, 15 August 1986-14 August 1989, 15:22097 (R;US)
Leaching of heavy metals from thermally decontaminated soils, 15:22553 (R;NL)
Partitioning of metals in rotary-kiln incineration, 15:22052 (R;US)

METEORITES
See also IRON METEORITES
Abstracts for the 52nd Annual Meeting of the Meteoritical Society, 15:22822 (R;US)
Allende meteorite: Cosmic rosetta stone. September 1972-November 1989 (Citations from the International Aerospace

Abstracts data base). Report for September 1972-November 1989, 15:22825 (R;US)
Meteoritic basalts. Final report, 1986-1989, 15:22823 (R;US)

METHANE
Activation of formylmethanofurna synthesis in cell extracts of Methanobacterium thermoautotrophicum, 15:22723 (J;US)
Anaerobic dechlorination of 2,4-dichlorophenol in freshwater sediments in the presence of sulfate, 15:22616 (R;US)
Charge/discharge characteristics of high-capacity methane adsorption storage systems, 15:21370 (R;US)
Chemical activation of methane. Annual report, 1 May 1988-30 April 1989, 15:21372 (R;US)
Genetics of bacteria that utilize one-carbon compounds: Annual report, January 1, 1988–October 15, 1989, 15:21582 (R;US)
Hydrologic characterization of coal seams for methane recovery. Final report, January 1987-April 1989, 15:21362 (R;US)
LOX/hydrocarbon combustion instability investigation. Final report, 15:22242 (R;US)
Mechanisms for the homogeneous, thermal conversion for methane to ethane and other saturated hydrocarbons: Volumes 1 and 2, 15:21594 (R;CA)
Oxide-bound transition metal complexes for methane activation. Final report, September 30, 1986-August 31, 1989, 15:21373 (R;US)
Quarterly review of methane from coal seams Technology. Volume 7, Numbers 1 and 2. October 1989, 15:21363 (R;US)
Synthesis for materials for reversible uptake and useful functionalization of methane. Annual report, January-December 1988, 15:21374 (R;GB)

METHANE HYDRATE DEPOSITS
See NATURAL GAS HYDRATE DEPOSITS

METHANE HYDRATES
See GAS HYDRATES

METHANOGENIC BACTERIA
Activation of formylmethanofurna synthesis in cell extracts of Methanobacterium thermoautotrophicum, 15:22723 (J;US)
Anaerobic dechlorination of 2,4-dichlorophenol in freshwater sediments in the presence of sulfate, 15:22616 (R;US)
Energetics of end product excretion in anaerboic bacteria and the metabolism of fatty acids by Syntrophomonas wolfei: Final report, March 15, 1985–March 14, 1989, 15:21581 (R;US)
Energetics of end product excretion in anaerobic bacteria and the metabolism of fatty acids by Syntrophomonas wolfei: Progress report, December 16, 1985–November 15, 1986, 15:22710 (R;US)
[Toxic organic compounds]: Progress report, 15:21576 (R;US)

METHANOL
Combustion and performance characteristics of methanol plus higher alcohols in a spark ignition engine, 15:22090 (B;US)
The role of lattice anion vacancies in the activation of CO and as the catalytic site for methanol synthesis over zirconium dioxide and yttria-doped zirconium dioxide, 15:21146 (J;US)

METHANOTROPHIC BACTERIA
Genetics of bacteria that utilize one-carbon compounds: Annual report, January 1, 1988–October 15, 1989, 15:21582 (R;US)

METHYL ALCOHOL
See METHANOL

METHYL-FUEL
See ALCOHOLS
METHANOL

METHYLBENZENE
See TOLUENE

METROPOLITAN AREAS
See URBAN AREAS

MHD EQUILIBRIUM
Equilibrium calculations for plasma control in CIT [Compact Ignition Tokamak], 15:23135 (R;US)

MHD GENERATOR CDIF
[Manage, operate and maintain the Component Development and Integration Facility in Butte, MT]: Quarterly technical progress report, October 1–December 31, 1989, 15:21953 (R;US)

MHD GENERATORS
Diagnostic development and support of MHD [magnetohydrodynamics] test facilities: Technical progress report, January, February, March 1988, 15:21950 (R;US)
Diagnostic development and support of MHD [magnetohydrodynamics] test facilities: Technical progress report, January, February, March 1989, 15:21952 (R;US)
Diagnostic development and support of MHD [magnetohydrodynamics] test facilities: Technical progress report, October, November, December 1988, 15:21951 (R;US)
Diagnostic development and support of MHD [magnetohydrodynamics] test facilities: Technical progress report, January, February, March 1989, 15:21952 (R;US)
Expectations for the Laguna foil implosion experiments, 15:21955 (BA;US)
The analysis of the influence of the current regulation on the parameters of the MHD-genarator Faraday's type and on the mutual work of the generator and electric power network, 15:21954 (R;PL;In Polish)

MICE
Disappearance of benzo[a]pyrene and other polycyclic aromatic hydrocarbons from mouse skin in vivo, 15:22777 (RA;US)
Kinetics of C3H 10T1/2 mouse cells, 15:22764 (RA;US)

MICELLAR-POLYMER FLOODING
See MICROEMULSION FLOODING

MICROELECTRONICS
A progress report on the Livermore miniature vacuum tube project, 15:22334 (R;US)

MICROEMULSION FLOODING
A three-dimensional, three-phase, simulator for permeability modification treatments using gelled polymers, 15:21288 (R;US)
Modelling and scale-up of chemical flooding: Third annual and Final report for the period October 1987–September 1988, 15:21286 (R;US)

MICROEMULSIONS
Transient behavior of foam flow in 1-D porous medium, 15:21282 (RA;US)

MICROSEISM
See SEISMIC NOISE

MICROSPHERES
On fabrication of UO_2 microspheres by internal gelation process, 15:21443 (R;JP)

MICROWAVE AMPLIFIERS
See also MASERS
High efficiency 1.7 GHz gyropeniotron amplifier, 15:23180 (BA;US)

MICROWAVE RADIATION
Effect of exposure to microwaves on the neuroendocrine status of the rat. Final report, 1 January 1979-30 June 1980, 15:22778 (R;US)
Efficiency optimization in a CARM amplifier, 15:23178 (BA;US)
High power microwave generation and particle accelerators, 15:23077 (BA;US)
Invited and contributed papers presented at the 14. International conference on infrared and millimeter waves, 15:22325 (R;CH)

MIGRATION
Yakima River spring chinook enhancement study: Annual report FY 1988, 15:21605 (R;US)

MIGRATION (RADIONUCLIDE)
See RADIONUCLIDE MIGRATION

MILITARY EQUIPMENT
See also ORDNANCE
Finite element models to predict the structural response of 120-mm sabot/rods during launch, 15:22465 (R;US)

MILITARY FACILITIES
Health assessment for Fort Dix Sanitary Landfill, Pemberton Township, New Jersey, Region 2. CERCLIS No. NJ2210020275. Preliminary report, 15:22634 (R;US)
Health assessment for Griffiss Air Force Base NPL (National Priorities List) site, Rome, Oneida County, New York, Region 2. CERCLIS No. NY4571924451. Final report, 15:22664 (R;US)

Health assessment for Naval Air Engineering Center, Lakehurst, Ocean County, New Jersey, Region 2. CERCLIS No. NJ7170023744. Preliminary report, 15:22645 (R;US)
Health assessment for Naval Weapons Station-Site A, Colts Neck, New Jersey, Region 2. CERCLIS No. NJ0170022172. Preliminary report, 15:22646 (R;US)

MINE SHAFTS
Subsurface TE scattering by tunnels using a surface line current, 15:22795 (R;US)

MINE-MOUTH GENERATING PLANTS
See FOSSIL-FUEL POWER PLANTS

MINERAL OIL
See LUBRICANTS

MINERAL RESOURCES
See also COAL DEPOSITS
PETROLEUM DEPOSITS
URANIUM DEPOSITS
Mineral resources of the Ragged Top Wilderness Study Area, Pima County, Arizona, 15:21906 (R;US)

MINERAL SPRINGS
Geochemistry, isotopic composition, and origin of fluids emanating from mud volcanoes in the Copper River basin, Alaska, 15:22798 (J;US)

MINERAL WASTES
Performance testing with high ash Indian coals and coal washery rejects in an AFBC pilot plant, 15:21175 (BA;US)

MINERALS
See also SILICATE MINERALS
ZEOLITES
Dual photon absorptiometry: Validation of mineral and fat measurements, 15:22722 (R;US)
Summaries of the thematic conferences on remote sensing for exploration geology, 15:21162 (R;US)

MINES
Waste heat recovery at the Lupin Mine, 15:22062 (RA;CA)

MINING
See also COAL MINING
HYDRAULIC MINING
OIL SAND MINING
SURFACE MINING
Ground subsidence due to mining operations. October 1976-November 1989 (Citations from the COMPENDEX data base). Report for October 1976-November 1989, 15:22576 (R;US)
Mining and energy challenges, 15:21389 (R;CA)
NIOSH (National Institute for Occupational Safety and Health) testimony on mine health research before the Subcommittee on Compensation, Health and Safety; House Committee on Education and Labor, by Edward J. Baier, April 4, 1977, 15:21895 (R;US)
NIOSH (National Institute for Occupational Safety and Health) testimony on mine health research before the Subcommittee on Labor, Senate Committee on Human Resources, by Edward J. Baier, March 31, 1977, 15:21896 (R;US)

MINING EQUIPMENT
Implementation of reliability concepts at Syncrude's Mining Department, 15:21390 (RA;CA)
OSLO [Other Six Leases Operation] project mine planning, 15:21378 (RA;CA)

MINNESOTA
Data compilation to accompany residence times of Minnesota ground waters. Final report, 15:22609 (R;US)

MIRRORS
See also FRESNEL REFLECTORS
Advanced composite materials for precision segmented reflectors, 15:22178 (RA;US)
SiO overcoating and polishing of CFRP telescope panels, 15:22179 (RA;US)

MISGURNUS

MODERATELY ENRICHED URANIUM
Analysis of uranium silicide fuel for the Ford nuclear reactor, 15:21783 (RA;US)
Comparison of calculated and measured irradiated wire data for high-enrichment uranium (HEU) and mixed HEU/LEU cores in the ORR, 15:21762 (RA;US)
Examination of U_3Si_2-Al fuel elements from the Oak Ridge Research Reactor, 15:21756 (RA;US)
Fuel core moderate enrichment uranium (MEU) fuel demonstration in the JMTR, 15:21763 (RA;US)
Irradiation and nuclear characteristics measurements of JRR-4 LEU fuel elements, 15:21757 (RA;US)
LEU silicide programs at Babcock and Wilcox, 15:21749 (RA;US)
MTR fuel development at CERCA status as of October 1986, 15:21751 (RA;US)
Neutronic scoping calculations for OSURR core design with standardized U_3Si_2 fuel plates, 15:21768 (RA;US)
Preliminary low-enrichment uranium (LEU) fuel cycle analyses for the Belgian BR2 reactor, 15:21765 (RA;US)
Progress report on LEU fuel testing in CEA reactors, 15:21758 (RA;US)
Quality assurance and inspection techniques in use at Babcock and Wilcox, 15:21752 (RA;US)
RERTR program fuel development and testing - the past year and the next, 15:21759 (RA;US)
Safety studies on the production of silicide fuel with low uranium enrichment in the framework of the AF programme, project no. 13. Final report, 15:21731 (R;DE;In German)
Selection of fuel type and core pattern and application for low-enrichment uranium (LEU)-licensing of the Danish reactor DR 3, 15:21766 (RA;US)
Status of the design of the Munich compact core with involute-shaped fuel plates, 15:21769 (RA;US)
The effect of fabrication variables on the irradiation performance of uranium silicide dispersion fuel plates, 15:21755 (RA;US)
The transition phase of the whole-core demonstration at the Oak Ridge Research Reactor, 15:21761 (RA;US)

MODERATORS
Study on temperature coefficient of reactivity in JUCA light-water moderated and reflected core effect of moderate/fuel ratio and core shape on this quantity, 15:21764 (RA;US)

MODULAR CONSTRUCTION
See MODULAR STRUCTURES

MODULAR STRUCTURES
Modular housing case study: Residential Construction Demonstration Project, 15:21965 (R;US)

MOISTURE
Moisture control in sealed electronic packages, 15:22261 (R;US)

MOLECULAR ORBITAL MODEL
See MOLECULES

MOLECULAR STRUCTURE
Center for Atomic, Molecular, and Optical Physics technical activities, 1989, 15:22857 (R;US)
Enzymology of acetone-butanol-isopropanol formation: Progress report, February 1, 1989–January 31, 1990, 15:22712 (R;US)

Photophysics of internal twisting, 15:22219 (R;FR)

MOLECULE-MOLECULE COLLISIONS
Ionization and ions pair formation in He(n^1P) thermal collisions in the Rydberg + molecules low states, 15:22848 (R;FR;In French)

MOLECULES
See also POLYATOMIC MOLECULES
An analytic model for ionization distributions produced in nanometer sites by protons, 15:22861 (RA;US)

MOLYBDATES
Catalyst dispersion and activity under conditions of temperature-staged liquefaction: Technical progress report, October–December 1989, 15:21126 (R;US)

MOLYBDENUM ALLOYS
Experimental evaluation of new alloy coatings. Final report, November 1986-January 1989, 15:22098 (R;US)

MOLYBDENUM COMPOUNDS
See also MOLYBDATES
MOLYBDENUM OXIDES
MOLYBDENUM SULFIDES
Catalyst dispersion and activity under conditions of temperature-staged liquefaction: Technical progress report, October–December 1989, 15:21126 (R;US)

MOLYBDENUM OXIDES
Reactive sputtering of molybdenum, 15:22158 (R;US)

MOLYBDENUM SULFIDES
MoS2 interactions with 1.5 eV atomic oxygen, 15:22066 (BA;US)
Synthesis and characterization of MoS2 thin films grown by pulsed laser evaporation, 15:22067 (BA;US)

MONITORING (BEAM)
See BEAM MONITORING

MONITORING (RADIATION)
See RADIATION MONITORING

MONITORS (REACTOR)

NATURAL GAS HYDRATE DEPOSITS
Mechanical properties of gas hydrates in unconsolidated media, 15:21360 (BA;US)
Petrographic characterization of hydrate reservoirs in northern Alaska, 15:21357 (BA;US)
Pore water geochemical anomalies: Reliable indicators of gas hydrate presence?, 15:21356 (BA;US)
Potential gas hydrate reservoir on the Barrow Arch, Alaska, 15:21358 (BA;US)

NATURAL GAS INDUSTRY
Canada's frontier lands: A new regulatory direction, 15:21332 (RA;CA)
Gas-cooling markets in the commercial sector, 15:21367 (R;US)
Natural gas monthly, December 1989, 15:21365 (R;US)
Reasons for decision [in the matter of] Esso Resources Canada Limited, Shell Canada Limited, and Gulf Canada Resources Limited. Applications pursuant to part 6 of the National Energy Board Act for Licences to Export Natural Gas, 15:21928 (R;CA)

NATURAL GAS LIQUIDS
Hydrocarbon and by-product reserves in British Columbia, 1988, 15:21352 (R;CA)

NATURAL GAS WELLS
Oil and gas exploration, drilling production summary, 1986, 15:21203 (R;CA)

NATURAL GASOLINE
See NATURAL GAS LIQUIDS

NATURAL LIGHTING
See DAYLIGHTING

NATURAL OCCURRENCE
Protection of wild adult steelhead in Idaho by adipose fin removal: Five year completion report: Final report, 15:21604 (R;US)

NATURAL RADIOACTIVITY
Environmental radiation data, 7: Background dose rate in and around Tokyo measured with portable instruments, 15:22504 (R;JP;In Japanese)
Is natural background or radiation from nuclear power plants leukemogenic?, 15:22745 (R;US)

NATURE RESERVES
Mineral resources of the Ragged Top Wilderness Study Area, Pima County, Arizona, 15:21906 (R;US)

NAVAL REACTORS
See SHIP PROPULSION REACTORS

NAVIER-STOKES EQUATION
See NAVIER-STOKES EQUATIONS

NAVIER-STOKES EQUATIONS
Numerical solutions of the complete Navier-Stokes equations. Progress report No. 16, 1 July 1988-31 December 1989, 15:22243 (R;US)

NAVIGATION
Vision-based navigation and parallel computing. Annual report No. 1, May 1988-May 1989, 15:23202 (R;US)

NEGATONS
See ELECTRONS

NEGATRONS
See ELECTRONS

NEODYMIUM LASERS
Characterisation of the light pulses of a cavity dumped dye laser pumped by a cw mode-locked and q-switched Nd:YAG laser, 15:22428 (R;FR;In French)
Performance of zig-zag slab regenerative ring amplifier laser system, 15:22335 (R;US)
Ultra-high brightness laser research at LLNL [Lawrence Livermore National Laboratory], 15:23153 (R;US)

NEON
A study of binary ion plasma expansion into laboratory generated plasma wakes, 15:23081 (BA;US)

NEOPLASMS
Clinical results of stereotactic hellium-ion radiosurgery of the pituitary gland at Lawrence Berkeley Laboratory, 15:22726 (R;US)
Comments on the analysis of occupational exposure to PCBs and various cancers by the industrial disease standard panel, 15:22782 (R;CA)
Follow-up study of persons who had iodine-131 and other diagnostic procedures during childhood and adolescence, 15:22732 (R;US)
Report on cancer risks associated with the ingestion of asbestos, 15:22772 (R;US)
The influence of fractionation and repair kinetics on radiation tolerance: Studies on rat lung and kidney, 15:22752 (R;NL)

NEPTUNIUM
Actinide speciation, further development and application of laser induced photoacoustic spectroscopy and voltammetry, 15:22204 (R;GB)

NEPTUNIUM COMPLEXES
Separation of neptunium oxidation states with continuous electrophoretic ion focusing, 15:22238 (RA;DE)
Thermodynamics and speciation: Solubility of PuO_2 and $Pu(OH)_4$ and electrophoretic speciation of Np ions. Progress report for the CEC project MIRAGE II, 15:22236 (R;DE)

NET TOKAMAK
Electron cyclotron current drive and m=2 mode stabilization in NET, 15:23071 (RA;NL)

NETHERLANDS
Annual report of the Committee for the environment-effect-reporting for the year 1988, 15:21744 (R;NL;In Dutch)
Reports from the RIVM 1987, 15:22737 (R;NL;In Dutch)
Reports from the RIVM 1988, 15:22765 (R;NL;In Dutch)

NETHERLANDS ORGANIZATIONS
The Dutch coordination commission for measurement of radioactivity and xenobiotic materials, 15:21901 (RA;NL;In Dutch)

NETWORKS (COMPUTER)
See COMPUTER NETWORKS
NEURAL NETWORKS
Experiments in finding neural network weights, 15:23215 (R;US)
Hybrid Intelligent Perception System: Intelligent perception through combining Artificial Neural Networks and an Expert System, 15:23210 (R;US)
NEUTRAL ATOM BEAM INJECTION
A new protection system against high voltage vacuum breakdowns developed for the Tore Supra neutral beam injector prototype, 15:21735 (R;FR)
NEUTRON ACTIVATION ANALYZERS
Aspects of accuracy and precision in the determination of As and Sb in biological materials by neutron activation analysis, 15:22458 (R;NL)
Neutron activation analysis and gamma ray spectrometry, 15:22213 (J;US)
NEUTRON CAPTURE
See NEUTRON REACTIONS
NEUTRON DIFFUSION EQUATION
Development of advanced nodal diffusion methods for modern computer architectures, 15:21723 (D;US)
NEUTRON DOSIMETRY
Implementing a new TLD system, 15:22749 (R;US)
Surveillance data bases, analysis, and standardization program, 15:21703 (RA;US)
NEUTRON FLUENCE
Nucleonic calculations for possible irradiation experiments in SAPHIR, 15:21721 (R;CH)
NEUTRON MATTER
See NUCLEAR MATTER
NEUTRON REACTIONS
A nuclear cross section calculation system with simplified input-format: Version 2, (SINCROS-II), 15:22940 (R;JP)
Activation cross section data file, (1), 15:22918 (R;JP;In Japanese)
URR [Unresolved Resonance Region] computer code: A code to calculate resonance neutron cross-section probability tables, Bondarenko self-shielding factors, and self-indication ratios for fissile and fertile nuclides, 15:22920 (R;US)
NEUTRON SOURCE FACILITIES
Optimization of the PS-2 core configuration for the ANS [Advanced Neutron Source] Reactor, 15:21781 (R;US)
NEUTRON TRANSPORT
Development of advanced nodal diffusion methods for modern computer architectures, 15:21723 (D;US)
NEUTRONS
Assessment of NJOY generated neutron heating factors based on JEF/EFF-1, 15:21722 (R;CH)
Final state effects in deep inelastic neutron scattering, 15:22951 (R;GB)
Neutron production in deuterium-nobel gas mixtures in a plasma focus, 15:23090 (BA;US)
User's guide for the small-angle neutron scattering facility, 15:22946 (R;NL)
NEVADA
Geologic map of the surficial deposits of the Topopah Spring quadrangle, Nye County, Nevada, 15:22797 (B;US)
NEVADA TEST SITE
Hydrologic activities of the US Geological Survey in support of the Radionuclide Migration Program, Nevada Test Site and vicinity, Nye County, Nevada, fiscal year 1987, 15:21528 (R;US)
Tunnel Review Executive Committee report of programs conducted in the Nevada Test Site tunnel complex, 15:22475 (R;US)
NEW BRUNSWICK
New Brunswick Natural Resources and Energy annual report 1988-1989, 15:21912 (R;CA)
[New Brunswick] Natural Resources and Energy, annual report, 1987-88, 15:21904 (R;CA)
NEW MEXICO
Coring an active hydrothermal system, 15:21634 (J;US)
Environmental sampling and mud sampling program of CSDP [Continental Scientific Drilling Program] core hole VC-2B, Valles Caldera, New Mexico, 15:21633 (R;US)
Significant cenozoic faulting, east margin of the Espanola basin, Rio Grande Rift, New Mexico, 15:22799 (J;US)
NEWFOUNDLAND
Ice data management systems, 15:21327 (R;CA)
NEXT EUROPEAN TORUS
See NET TOKAMAK
NGL
See NATURAL GAS LIQUIDS
NICKEL
An investigation of the dislocation structure of the Ni/Ag phase boundary, 15:22106 (R;US)
Fundamental studies of catalytic gasification: Annual report, October 1, 1988–September 30, 1989, 15:21134 (R;US)
L shell XANES [x-ray absorption near edge structure] for solid metals: Ti, V, Cr, Fe, Ni, Cu, 15:22865 (R;US)
NICKEL 58 TARGET
Populations of excited states and reaction mechanisms in the emission of complex fragments, 15:22926 (R;US)
NICKEL ALLOYS
See also NICKEL BASE ALLOYS
Advances and future directions in superplastic materials, 15:22099 (RA;FR)
Anomalous behavior of the electrical resistivity in alloys near the $PrNi_{5.0}$ composition, 15:22134 (J;CH)
NICKEL BASE ALLOYS
Environmental effects on corrosion in the Tuff repository, 15:21512 (R;US)
The stress corrosion performance of diffusion bonded nickel base alloys, 15:22116 (R;US)
NICKEL COMPOUNDS
See also NICKEL OXIDES
Copper and nickel partitioning in iron meteorites, 15:22803 (J;US)
NICKEL ISOTOPES
Nuclear structure effects in exciton level densities, 15:22928 (R;US)
NICKEL OXIDES
Fundamental studies of catalytic gasification: Quarterly report for October 1, 1989-December 31, 1989, 15:21136 (R;US)
NIGERIA
Chemical composition of bitumen extracts from Nigerian tar sands, 15:21426 (RA;US)
Environmental aspects of heavy crude and tar sands exploration, production, and transportation with special reference to Nigeria, 15:21437 (RA;US)
NIGHTGLOW
See AIRGLOW
NIOBIUM
Corrosion properties of Fe_3Al in H_2S-H_2-H_2O mixtures, 15:21120 (R;US)
NIOBIUM OXIDES
Hydrous metal oxide-supported catalysts: Part 1, Preparation chemistry and physical and chemical properties, 15:21140 (R;US)
NIOSH
NIOSH (National Institute for Occupational Safety and Health) testimony on coal mine health research before the Subcommittee on Labor Standards, House Committee on Education and Labor, by Edward J. Baier, June 29, 1977, 15:21181 (R;US)
NIOSH (National Institute for Occupational Safety and Health) testimony on mine health research before the Subcommittee on Labor, Senate Committee on Human Resources, by Edward J. Baier, March 31, 1977, 15:21896 (R;US)
NIOSH (National Institute for Occupational Safety and Health) testimony on mine health research before the Subcommittee on Compensation, Health and Safety; House Committee on Education and Labor, by Edward J. Baier, April 4, 1977, 15:21895 (R;US)
NIOSH (National Institute for Occupational Safety and Health) testimony on occupational diseases before the Senate Committee on Labor and Human Resources, by Anthony Robbins, April 2, 1979, 15:22734 (R;US)

NITRATES
Data compilation to accompany residence times of Minnesota ground waters. Final report, 15:22609 (R;US)
NITRO COMPOUNDS
Ignition of HMX [cyclotetramethylenetetranitramine] using low energy laser diodes, 15:22469 (R;US)
NITROGEN
Diagnostic development and support of MHD [magnetohydrodynamics] test facilities: Technical progress report, January, February, March 1989, 15:21952 (R;US)
Weldability and microstructural analysis of nuclear-grade austenitic stainless steels, 15:22133 (D;US)
NITROGEN 15
Separation of nitrogen and oxygen isotopes by liquid chromatography, 15:22228 (J;GB)
NITROGEN FLUORIDES
Electron collisions with processing plasma constituents, 15:23080 (BA;US)
NITROGEN NITRIDES
See NITROGEN
NITROGEN OXIDES
See also NITROUS OXIDE
Development of the National Acid Precipitation Assessment Program (NAPAP) National Utility Reference File (NURF) emissions inventory, 1985, Version 2 (for microcomputers). Data file, 15:21666 (R;US)
Liquefied Gaseous Fuels Spill Test Facility program: Eleven additional chemicals: Environmental Assessment, 15:22767 (R;US)
Reduction of NO_x and SO_2 emissions from coal burning pulse combustors: Quarterly technical progress report, October 1, 1989–December 31, 1989, 15:21168 (R;US)
NITROUS OXIDE
Assessment of Substitute N_2O in flue gas, 15:21664 (R;CA)
NO. 2 FUEL OIL
See HEATING OILS
NOBELIUM 254
Studies on the synthesis and characterisation of superheavy elements, 15:22231 (R;DE;In German)
NOISE (REACTOR)
See REACTOR NOISE
NOISE POLLUTION
Cumulative airport noise-exposure metrics: An assessment of evidence for time-of-day weightings. Revision, 15:22779 (R;US)
NOISE THERMOMETERS
Radiometer equation and analysis of systematic errors for the NIST (National Institute of Standards and Technology) automated radiometers. Technical note, 15:22464 (R;US)
NON-EQUILIBRIUM PLASMA
A review of the modeling of low pressure discharges for plasma chemistry and plasma processing, 15:23181 (BA;US)
Electron temperature and current density measurements at the anode of free burning, high intensity arcs, 15:23085 (BA;US)
Feedback control of a polymer producing glow discharge plasma, 15:23088 (BA;US)
NON-INDUCTIVE CURRENT DRIVE
Quasilinear and toroidal effects on current drive by electron cyclotron waves, 15:23046 (R;NL)
NON-PROLIFERATION POLICY
Key nonproliferation issues, 15:22092 (R;US)
NONDESTRUCTIVE TESTING
Evaluation and improvement in nondestructive examination (NDE) reliability for in-service inspection of light water reactors, 15:21695 (RA;US)
Institute for Materials Science and Engineering, Nondestructive Evaluation: technical activities, 1989. Annual report, 15:22287 (R;US)
NONLINEAR OPTICS
Nonlinear optics technology. Phase 2. Area 1. Four-wave-mixing technology. Area 2. Phase conjugated solid state laser technology. Final report, September 1986-January 1988, 15:22315 (R;US)
NONLINEAR PROBLEMS
Dynamic extension of the Simulation Problem Analysis Kernel (SPANK), 15:21996 (R;US)
NONLINEAR SYSTEMS
See NONLINEAR PROBLEMS
NONRADIOACTIVE WASTE DISPOSAL
See WASTE DISPOSAL
NORTHERN IRELAND

Materials control and accounting in a plutonium processing facility, 15:21561 (RA;US)
Measurement control and quality assurance, 15:21558 (RA;US)
PC-DYMAC: Personal Computer—DYnamic Materials ACcounting, 15:21548 (R;US)
Part one: Statistical concepts, 15:21554 (RA;US)
Part two: Error propagation, 15:21555 (RA;US)
Process holdup of special nuclear materials, 15:21557 (RA;US)
Statistical decisions, 15:21556 (RA;US)
Study of relationship between MUF correlation and detection sensitivity of statistical analysis, 15:21550 (R;JP;In Japanese)
Survey of chemical and bulk measurement methods, 15:21562 (RA;US)
The structure of nuclear safeguards systems, 15:21552 (RA;US)
Workshop on materials control and accounting system design, 15:21566 (RA;US)
Workshop on real-time materials accounting simulator, 15:21564 (RA;US)

NUCLEAR MATTER
On the role of quantum tunneling and statistical effects in the liquid gas phase transition of hot nuclei, 15:22939 (R;FR)

NUCLEAR MEDICINE
Follow-up study of persons who had iodine-131 and other diagnostic procedures during childhood and adolescence, 15:22732 (R;US)

NUCLEAR PHYSICS
Center for Radiation Research (of the National Institute of Standards and Technology) technical activities for 1989, 15:21571 (R;US)
Nuclear Science Division annual report for the period October 1, 1987–September 30, 1988, 15:22919 (R;US)

NUCLEAR POWER
1989 GRI baseline projection of US energy supply and demand to 2010: Gas Research Insights, 15:21925 (R;US)
Evaluation of the system of licences and the registration of radioactive materials of the Dutch Nuclear power law: Final report, 15:21716 (R;NL;In Dutch)

NUCLEAR POWER PLANTS
Buildings
Assessment of effects of structural response on plant risk and margin, 15:21823 (RA;US)

Cables
Condition monitoring and aging assessment of Class 1E cables, 15:21807 (RA;US)
Computerized Simulation
Simulator requirements manual: Final report, 15:21689 (R;US)
Equipment
Similarity principles for seismic qualification of equipment by experience data, 15:21831 (RA;US)
Fire Hazards
Risk management application of fire risk analysis, 15:21683 (RA;XA)
Impact Shock
Conception and realization of an expert system to help the interpretation of the mechanical shocks in a nuclear power plant, 15:21726 (R;FR;In French)
Materials Testing
Lessons in solid-state kinetics from nuclear energy research, 15:21728 (J;US)
Nuclear production research expands materials knowledge, 15:21729 (J;US)
Mechanical Structures
Assessment of effects of structural response on plant risk and margin, 15:21823 (RA;US)
Radiation Protection
Status, experience and future prospects for the development of probabilistic safety criteria: Report of a technical committee meeting held in Vienna, 27-31 January 1986, 15:21802 (R;XA)
Radioactive Waste Management
An assessment of high-level radioactive waste disposal for advanced reactor fuel cycles, 15:21469 (R;US)
Reactor Control Systems
Seismic fragility of nuclear power plant components (Phase II): Volume 3, Switchgear, I and C panels (NSSS) and relays, 15:21837 (R;US)
Reactor Instrumentation
Seismic fragility of nuclear power plant components (Phase II): Volume 3, Switchgear, I and C panels (NSSS) and relays, 15:21837 (R;US)
Reactor Operation
Licensee Event Report (LER) compilation for month of January 1990, 15:21715 (R;US)
Reactor Safety
CEC task force on safety goals: Summary, 15:21685 (RA;XA)
Report to Congress on abnormal occurrences, July–September 1989, 15:21804 (R;US)
Status of probabilistic safety criteria in Italy, 15:21701 (RA;XA)
Status, experience and future prospects for the development of probabilistic safety criteria: Report of a technical committee meeting held in Vienna, 27-31 January 1986, 15:21802 (R;XA)
The Swedish view of probabilistic safety criteria - Present status, 15:21672 (RA;XA)
Reactors
[Small and Medium-Size Reactor Expert Group]: Foreign trip report, February 9–14, 1990, 15:21688 (R;US)
Regulations
Closeout of IE Bulletin 80-10: Contamination of nonradioactive system and resulting potential for unmonitored, uncontrolled release of radioactivity to the environment, 15:21844 (R;US)
Closeout of IE Bulletin 85-03: Motor-operated valve common mode failures during plant transients due to improper switch settings, 15:21838 (R;US)
Risk Assessment
A method to incorporate uncertainty and degree of compliance in safety goals, 15:21674 (RA;XA)
Approach to PSA methods and probabilistic safety criteria in licensing of nuclear power plants in the Federal Republic of Germany, 15:21679 (RA;XA)
Comparison of different societal risks: A new limit-line concept, 15:21678 (RA;XA)
PRISIM - A computer program that makes PRA useful, 15:21684 (RA;XA)
Prospects for probabilistic safety criteria (PSC), 15:21675 (RA;XA)
Some questions on the development of probabilistic safety criteria, 15:21686 (RA;XA)
Status of probabilistic safety criteria in Italy, 15:21701 (RA;XA)
The Swedish view of probabilistic safety criteria - Present status, 15:21672 (RA;XA)

COLD LAKE DEPOSIT
Bitumens
Chemical composition of bitumen extracts from Nigerian tar sands, 15:21426 (RA;US)
Exploration
An integrated development plan for the Zuata area of the Orinoco heavy oil belt, 15:21197 (RA;US)
Environmental aspects of heavy crude and tar sands exploration, production, and transportation with special reference to Nigeria, 15:21437 (RA;US)
Geotomography for exploration of heavy oil deposits, 15:21383 (RA;US)
Use of surface geophysical techniques in oil sands exploration, 15:21379 (RA;US)

Geology
Distribution and geological characteristics of heavy oil in China, 15:21185 (RA;US)
Exploration and evaluation of the Orinoco oil belt final results, 15:21192 (RA;US)
Geology and mining of Bemolanga tar sands: Physico-chemical studies, 15:21382 (RA;US)
LAGOVEN's heavy oil fields of southern Monagas, eastern Venezuela basin, 15:21196 (RA;US)
Mineralogy and geology of the clearwater reservoir sands in the Wolf Lake area, Cold Lake, Alberta, 15:21381 (RA;US)
Occurrence of heavy crude oil in Cambay Basin, India, 15:21187 (RA;US)
Oil sands of Sao Paulo state, Brazil and La Brea de Chump, Peru: A geologic perspective, 15:21380 (RA;US)

Hot-Water Processes
Results from a preliminary feasibility study of electromagnetic hot water flooding for tar sands and heavy oil, 15:21237 (RA;US)

Hydraulic Fracturing
Potential use of fracture technology for recovery of bitumen from oil sands, 15:21386 (RA;US)

Hydraulic Mining
Downhole hydraulic mining system, 15:21387 (RA;US)

In-Situ Combustion
An oil sands oxygen in situ combustion project, 15:21407 (RA;US)
Evaluation of the P2-3 sand in situ combustion project in the Miga field of eastern Venezuela, 15:21397 (RA;US)

Mineralogy
Mineralogy and geology of the clearwater reservoir sands in the Wolf Lake area, Cold Lake, Alberta, 15:21381 (RA;US)

Reservoir Rock
Petrophysical evaluation of the Orinoco Heavy Oil Belt area Hamaca-Pao, 15:21195 (RA;US)

Steam Injection
A method for treating recalcitrant oil-in-water emulsions from steam-stimulated bituminous deposits, 15:21239 (RA;US)
Design and development of thermal pilots for recovery of heavy oil from the tar sands of the Ras Gharib field, Gulf of Suez, Egypt, 15:21409 (RA;US)
Evaluation of additives to enhance the in situ steam processes applied to US and Canadian tar sand and heavy oil reservoirs, 15:21411 (RA;US)
Factors affecting producibility of oil sands by steam stimulation, 15:21406 (RA;US)
Investigation of wet oxidation for bitumen and heavy oil recovery operations, 15:21238 (RA;US)
Laboratory comparison of steam recovery experiments using preserved oil sand cores, 15:21405 (RA;US)
Simulation of steam injection through horizontal wellbores for viscous oil recovery, 15:21243 (RA;US)

Steam Soak Processes
Production of heavy crudes in presence of water, 15:21217 (RA;US)

Thermal Recovery
In situ RF heating for oil sand and heavy oil deposits, 15:21404 (RA;US)

Well Drilling
Mud systems and solids control at Wolf Lake, 15:21396 (RA;US)
Optimized cluster drilling in the Orinoco Heavy Oil Belt, 15:21221 (RA;US)

OIL SAND INDUSTRY
Environmental aspects of heavy crude and tar sands exploration, production, and transportation with special reference to Nigeria, 15:21437 (RA;US)
International cooperation concerning heavy crude and tar sands, 15:21431 (RA;US)
Mining and energy challenges, 15:21389 (R;CA)
Saskatchewan heavy oil deposit environmental constraints study, 15:21438 (RA;US)
Selection and application of an atmospheric dispersion model for tropical environments, 15:21436 (RA;US)
The establishment of a legal framework for the development of heavy crude and tar sands resources, 15:21440 (RA;US)
Transforming a white collar professional organization, 15:21434 (RA;CA)

OIL SAND MINING
AOSTRA [Alberta Oil Sands Technology and Research Authority] underground test facility progress and potential, 15:21391 (RA;CA)
Application of conveyor belt monitoring technology to conveyor belt reliability, 15:21393 (RA;CA)
Development of a borehole hydraulic mining method for the OSLO [Other Six Leases Operation] shallow oil sands deposits, 15:21394 (RA;CA)
Exploitation of shallow oil sands beyond surface mining limits, 15:21419 (RA;CA)
Implementation of reliability concepts at Syncrude's Mining Department, 15:21390 (RA;CA)
OSLO [Other Six Leases Operation] project, 15:21392 (RA;CA)
OSLO [Other Six Leases Operation] project mine planning, 15:21378 (RA;CA)
Progress report on the construction of an underground test facility in the Athabasca deposit, Alberta, Canada, 15:21408 (RA;US)
Syncrude Canada Ltd. Environmental challenges into the 1990's, 15:21439 (RA;CA)
The case for a small oil sands mining project, 15:21377 (RA;CA)

OIL SAND OILS
See BITUMENS

OIL SAND PROCESSING PLANTS
Coal, a fuel option for heavy oil recovery operations, 15:21421 (RA;CA)
Heavy oil recovery methods - A classification system, 15:21410 (RA;US)
Microscopic characterization of oil sands processing emulsions, 15:21417 (R;CA)

OIL SAND TAILINGS
Beneficiation of heavy metal minerals from oil sands and oil sand tailings by oil phase agglomeration, 15:21279 (RA;US)
Syncrude Canada Ltd. Environmental challenges into the 1990's, 15:21439 (RA;CA)

OIL SANDS
A biotechnological alternative for recovering heavy oil, 15:21212 (RA;US)
A new extraction technology for tar sand production, 15:21402 (RA;US)
Field observations of steam distribution during injection to the Cold Lake Reservoir, 15:21420 (RA;CA)
Large scale laboratory fracturing test in oil sands, 15:21422 (RA;CA)
New analytical results on oil sands from deposits throughout the world, 15:21395 (RA;US)
Organic matter-mineral interaction in oil sands solids, 15:21278 (RA;US)
Pilot plant test of the Taciuk process on oil sands from Madagascar, 15:21399 (RA;US)
Processing of Athabasca oil sands by agglomeration and solvent extraction, 15:21403 (RA;US)
Recovery of bitumen from tar sands by a thermally coupled fluidized-bed process, 15:21400 (RA;US)
Seven years of successful Venezuelan-German projects in heavy oil production and upgrading, 15:21432 (RA;US)
Tailings pond bitumen extraction and sludge solidification, 15:21435 (RA;US)
Technological advances in oil sand development in syncrude, 15:21388 (RA;US)
The ENPEX project: System design and economic analysis of an integrated tar sands production and upgrading project, 15:21398 (RA;US)
The Herter solvent extraction process for the recovery of heavy oils and tars, 15:21401 (RA;US)
The role of lithology in the generation of heavy oils: A laboratory simulation study, 15:21199 (RA;US)
The role of oil sands in meeting Canada's future energy needs, 15:21376 (RA;US)

OXYGEN 16 TARGET
Evaluation of neutron nuclear data for ^{16}O, 15:22925 (R;JP)
High spin levels populated in multinucleon transfer reaction with 480 MeV ^{12}C, 15:22933 (R;FR)
Nucleon multiplicities after pion absorption in $^{16}0$, 15:22922 (R;NL)
On the spin-orbit deformation in inelastic scattering of polarized protons at intermediate energy, 15:22924 (R;FR)
OXYGEN 17
Separation of nitrogen and oxygen isotopes by liquid chromatography, 15:22228 (J;GB)
OXYGEN 18
Separation of nitrogen and oxygen isotopes by liquid chromatography, 15:22228 (J;GB)
OXYGEN 18 TARGET
On the spin-orbit deformation in inelastic scattering of polarized protons at intermediate energy, 15:22924 (R;FR)
OXYGEN EFFECT (RADIOBIOLOGY)
See OXYGEN
OXYGEN HYDRIDES
See WATER
OXYMETHYLENE
See FORMALDEHYDE
OZONE
Catching our breath: Next steps for reducing urban ozone, 15:22512 (R;US)
1-PROPANOL
See PROPANOLS

P

P REACTOR
Safety issues at the defense production reactors: A report to the US Department of Energy, 15:21790 (R;US)
PACIFIC NORTHWEST REGION
See FEDERAL REGION X
PACKAGING
Moisture control in sealed electronic packages, 15:22261 (R;US)
PAH
See POLYCYCLIC AROMATIC HYDROCARBONS
PALLADIUM
Elementary steps in the formation of highly dispersed palladium in NaY. II. Particle formation and growth, 15:22227 (J;US)
PARALLEL PROCESSING
A parallel particle-in-cell model for the massively parallel processor, 15:23238 (BA;US)
An optimally portable SIMD programming language, 15:23245 (BA;US)
Development of advanced WTA (Weapon Target Assignment) algorithms for parallel processing. Final report, 15:22484 (R;US)
Genetic adaptive system for image understanding and learning research. Phase 1. Final technical report, 1 February-1 August 1989, 15:23206 (R;US)
Hybrid (optical/electronic) computing and digital optical computing. Final report, 1 September 1985-31 August 1988, 15:23203 (R;US)
Implementation of a 3D thermal analysis code on the CM-2 connection machine computer, 15:23237 (BA;US)
On data synchronization for multiprocessors, 15:23240 (BA;US)
Parallel functional computation. Final report, 15 June 1986-14 August 1989, 15:23204 (R;US)
Parallel logic programming and parallel systems software and hardware. Progress report (Final), 1 April 1988-31 March 1989, 15:23205 (R;US)
Pipelined data parallel algorithms: Concept and modeling, 15:23239 (BA;US)
Regular processor arrays, 15:23242 (BA;US)
Simulation and analysis of enhanced switch architectures for interconnection networks in massively parallel shared memory machines, 15:23241 (BA;US)
Supercomputers need super arithmetic. Final report, 15:23221 (R;US)
The epsilon dataflow processor, 15:23236 (BA;US)
Theory for graph-based language specification, analysis, and mapping with application to the development of parallel software. Doctoral thesis, 15:23207 (R;US)
Transputers and the OCCAM programming language. November 1988-December 1989 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for November 1988-December 1989, 15:23226 (R;US)
Transputers and the occam programming language. January 1975-October 1988 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for January 1975-October 1988, 15:23225 (R;US)
Vision-based navigation and parallel computing. Annual report No. 1, May 1988-May 1989, 15:23202 (R;US)
PARAMETRIC ANALYSIS
How good are single zone - monthly based - correlation methods for building energy and comfort performance assessment, 15:22008 (RA;CA)
PARTIAL DIFFERENTIAL EQUATIONS
See also BOLTZMANN-VLASOV EQUATION
NAVIER-STOKES EQUATIONS
The basis spline method and associated techniques, 15:22976 (R;US)
Transition to turbulence via spatiotemporal intermittency, 15:22975 (R;FR)
PARTICLE BEAM FUSION ACCELERATOR
See also ELECTRON BEAM FUSION ACCELERATOR
Design of a laser-produced lithium anode plasma experiment on the Helia extraction diode, 15:23190 (BA;US)
Designing an experimenters database using the Nijssen Information Analysis Methodology (NIAM), 15:23147 (R;US)
Development of the BOLVAPS/LIBORS lithium ion source for the PBFA II accelerator, 15:23158 (BA;US)
High power microwave generation and particle accelerators, 15:23077 (BA;US)
PBFA II: The pulsed power characterization phase, 15:22409 (BA;US)
PBFA-II energy storage system performance and operation, 15:22419 (BA;US)
Plasma opening switch experiments on the Particle Beam Accelerator II, 15:23162 (BA;US)
Progress in ion beam research at Sandia National Laboratories, 15:23168 (BA;US)
Status of plasma opening switch development for the Particle Beam Fusion Accelerator II (PBFA II), 15:22405 (BA;US)
TEM analysis and computer simulations of DEMON and PBFA-II open transmission-line systems, 15:22408 (BA;US)
PARTICLE DISCRIMINATION
The scintillation counter system at the SAPHIR detector, 15:22423 (R;DE;In German)
PARTICLE LOSSES
Current drive and particle control by divertor biasing, 15:23000 (RA;XA)
PARTICLE TRACKS
An analytic model for ionization distributions produced in nanometer sites by protons, 15:22861 (RA;US)
Microscopic dosimetry of ions in nanometer sites: Touchers, 15:22448 (RA;US)
Microscopic track structure of equal linear-energy-transfer heavy ions, 15:22863 (RA;US)
Track structure for 10- to 300-keV protons, 15:22862 (RA;US)

PARTICULATES
Air-pollution sampling of particles. February 1981-April 1986 (Citations from the NTIS data base). Report for February 1981-April 1986, 15:22536 (R;US)
Air-pollution sampling of particles. May 1986-January 1990 (Citations from the NTIS data base). Report for May 1986-January 1990, 15:22537 (R;US)
Guideline series: Guidance document for residential wood-combustion emission-control measures, 15:21894 (R;US)
Hydrodynamic interactions and transport coefficients in a suspension of spherical particles, 15:22276 (R;US)
Particulate matter dynamics and phytoplankton seasonality in a reservoir embayment ecosystem, 15:22608 (R;US)
Shelf Edge Exchange Processes-2: SEEP2-01, R/V ENDEAVOR cruise 172: Hydrographic data report, 15:22784 (R;US)
Shelf Edge Exchange Processes-2: SEEP2-03, R/V ENDEAVOR cruise 178: Hydrographic data report, 15:22786 (R;US)
Shelf Edge Exchange Processes-2: Seep2-02, R/V CAPE HATTERAS cruise CH01-88: Hydrographic data report, 15:22785 (R;US)

PATTERN RECOGNITION
Optimization techniques for feature extraction in automatic pattern recognition. Final report, 15:23246 (R;US)

PBFA
See PARTICLE BEAM FUSION ACCELERATOR

PBX DEVICES
Impurity behavior in PBX L- and H-mode plasmas, 15:23008 (RA;XA)

Plasma transport in ergodized magnetic fields, 15:23013 (RA;XA)
Scaling study of scrape-off layer and divertor plasmas, 15:23002 (RA;XA)

PLASMA SHEATH
High-frequency instability of the sheath-plasma resonance, 15:23061 (R;US)
Measurement of sheath potential in an RF inductive discharge plasma with a DC magnetic field, 15:23079 (BA;US)

PLASMA SIMULATION
A parallel particle-in-cell model for the massively parallel processor, 15:23238 (BA;US)
A review of the modeling of low pressure discharges for plasma chemistry and plasma processing, 15:23181 (BA;US)
A study of binary ion plasma expansion into laboratory generated plasma wakes, 15:23081 (BA;US)
Absorbing boundaries for space plasma simulations, 15:23166 (BA;US)
Analysis and nonlinear simulation of quadrupole and dipole wiggler FELs for millimeter waves, 15:23179 (BA;US)
Auroral breakup during substorm onsets, 15:22842 (BA;US)
Computer simulations of finite plasmas convected across magnetized plasmas, 15:23167 (BA;US)
Design studies of an electrostatic quadrupole channel for transport of a high-brightness H^- beam and comparison with gas focusing, 15:23173 (BA;US)
Dielectric-in-cell and N-body-dielectric simulations of $E\rightarrow \times B\rightarrow$ drifting plasma clouds, 15:23176 (BA;US)
Efficiency optimization in a CARM amplifier, 15:23178 (BA;US)
Excitation of high frequency, electrostatic waves in the magnetospheres of the outer planets, 15:23172 (BA;US)
Experimental investigation of a localized electron temperature elevation near electron cyclotron resonance, 15:23078 (BA;US)
Implicit particle simulation of vortex coalescence in an electrostatic plasma, 15:23163 (BA;US)
Nonlinear mode competition and coherence in low gain FEL oscillators, 15:22342 (BA;US)
Numerical simulation of plasmas on an unstructured grid, 15:23174 (BA;US)
Optimization of the efficiency in gyrotron backward wave oscillator model via tapered axial magnetic field, 15:23089 (BA;US)
Phase locking of ultra-high power relativistic magnetrons, 15:23191 (BA;US)
Plasma armatures in large bore launchers, 15:23171 (BA;US)
Progress in ion beam research at Sandia National Laboratories, 15:23168 (BA;US)
Theory of voltage decay in applied-B ion diodes, 15:23075 (BA;US)
Two-dimensional simulations of imploding gas puff plasmas, 15:23183 (BA;US)

C Codes
CASK: An electromagnetic and electrostatic particle-in-cell simulation code with conformal boundaries, 15:23165 (BA;US)

Calculation Methods
New methods in plasma simulation, 15:23056 (R;US)

Computer Graphics
Computation and graphics in mathematical research: Progress report, June 1, 1989–May 31, 1990, 15:23211 (R;US)

PLASMA SWITCHES
Plasma opening switch experiments on the Particle Beam Accelerator II, 15:23162 (BA;US)
Status of plasma opening switch development for the Particle Beam Fusion Accelerator II (PBFA II), 15:22405 (BA;US)

PLASMA WAVES
Dynamical systems in plasma theory, 15:22994 (R;FR)
Electromagnetic wave scattering in turbulent plasmas, 15:23068 (R;GB)
Excitation of high frequency, electrostatic waves in the magnetospheres of the outer planets, 15:23172 (BA;US)
Particle simulations in magnetospheric plasmas. Final Technical report, 1 November 1988-31 October 1989, 15:23062 (R;US)
Resistive and eruptive instability by ponderomotive force with high-frequency plasma oscillations, 15:23064 (R;US)
Stimulated Raman scattering and ion dynamics: the role of Langmuir wave non-linearities, 15:22984 (R;FR)
Waves in plasmas: Highlights from the past and present, 15:23066 (R;US)

PLASMONS
Collective aspects of charged particle track structure, 15:22956 (R;US)

PLASTICS INDUSTRY
Health assessment for Robintech Site, Broome County, Vestal, New York, Region 2. CERCLIS No. NYD002232957. Preliminary report, 15:22700 (R;US)

PLATES
Study on homogenizing methods of bulk density in coke oven, 15:21129 (RA;JP;In Japanese)

PLATES (FUEL)
See FUEL PLATES

PLATINUM 193
Calculations of Auger-cascade-induced reactions with DNA in aqueous solution, 15:22750 (R;US)

PLATINUM 195
Calculations of Auger-cascade-induced reactions with DNA in aqueous solution, 15:22750 (R;US)

PLESIOTHERAPY
See RADIOTHERAPY

PLUMES
$Y_1Ba_2Cu_3O_{7-x}$ laser-ablation plume dynamics measurement by nanosecond response ion probe: Comparison with optical measurements, 15:22453 (R;US)

PLUTO PLANET
Magnetospheric plasma physics, 15:22841 (R;GB)

PLUTONIUM
Actinide speciation, further development and application of laser induced photoacoustic spectroscopy and voltammetry, 15:22204 (R;GB)
Determination of plutonium oxidation states by solvent extraction, 15:22209 (BA;US)
Differential thermal analyzer for research on plutonium fuels and its application to analysis of phase diagrams for alloy systems, 15:21442 (R;JP;In Japanese)
Measurements of plutonium, 15:22211 (J;US)
Silver, copper, and honest-to-god copper, 15:21786 (J;US)
The geochemistry of fallout plutonium in the North Atlantic: II. $^{240}Pu/^{239}Pu$ ratios and their significance, 15:22708 (J;US)

X-ray diffraction data for plutonium compounds: Volume 1, Plutonium and plutonium binary compounds: Pu, H-Se, 15:22233 (R;US)
X-ray diffraction data for plutonium compounds: Volume 2, Plutonium and plutonium binary compounds: Br-Es, 15:22234 (R;US)

PLUTONIUM 239
Derivation of decay heat benchmarks for U235 and Pu239 by a least squares fit to measured data, 15:21717 (R;GB)
Determination of the plutonium contamination level in biological samples by liquid scintillation, 15:22201 (R;FR;In French)
Revision of fast reactor group constant set JFS-3-J2, 15:21709 (R;JP;In Japanese)

PLUTONIUM 240
Determination of the plutonium contamination level in biological samples by liquid scintillation, 15:22201 (R;FR;In French)

PLUTONIUM 241
Revision of fast reactor group constant set JFS-3-J2, 15:21709 (R;JP;In Japanese)

PLUTONIUM COMPOUNDS
See also PLUTONIUM HYDROXIDES
X-ray diffraction data for plutonium compounds: Volume 1, Plutonium and plutonium binary compounds: Pu, H-Se, 15:22233 (R;US)
X-ray diffraction data for plutonium compounds: Volume 2, Plutonium and plutonium binary compounds: Br-Es, 15:22234 (R;US)

PLUTONIUM DIOXIDE
Solubility products of plutonium(IV) oxide and hydroxide, 15:22237 (RA;DE)
Thermodynamics and speciation: Solubility of PuO_2 and $Pu(OH)_4$ and electrophoretic speciation of Np ions. Progress report for the CEC project MIRAGE II, 15:22236 (R;DE)

PLUTONIUM HYDROXIDES
Solubility products of plutonium(IV) oxide and hydroxide, 15:22237 (RA;DE)
Thermodynamics and speciation: Solubility of PuO_2 and $Pu(OH)_4$ and electrophoretic speciation of Np ions. Progress report for the CEC project MIRAGE II, 15:22236 (R;DE)

PNA

Aging assessment of PWR auxiliary feedwater systems, 15:21817 (RA;US)

Fuel Assemblies
Evaluation of discrepancies in assembly cross-section generator codes: Volume 3, Assembly calculations: Final report, 15:21794 (R;US)

Fuel Elements
Modeling of in-vessel fission product release including fuel morphology effects for severe accident analyses: Advanced Reactor Severe Accident Program, 15:21791 (R;US)

Pipe Joints
Degraded piping program - Phase II. Battelle Columbus Division, 15:21691 (RA;US)

Pressure Vessels
Acoustic emission - flaw relationships for in-service monitoring of nuclear reactor pressure boundaries, 15:21696 (RA;US)
Dosimetry measurement reference data base for LWR pressure vessel irradiation surveillance, 15:21738 (RA;US)
French verification of PWR vessel integrity: Final report, 15:21800 (R;US)
Heavy-section steel technology program, 15:21690 (RA;US)
High-temperature crack-arrest tests using 152-mm-thick SEN wide plates of low-upper-shelf base material: Tests WP-2.2 and WP-2.6, 15:21700 (R;US)
LWR pressure vessel surveillance dosimetry improvement program, 15:21693 (RA;US)
Structural integrity of light water reactor pressure boundary components, 15:21702 (RA;US)
Surveillance data bases, analysis, and standardization program, 15:21703 (RA;US)

Radiation Protection
Progress in radiation control technology: Final report, 15:21799 (R;US)

Reactor Accidents
An exploratory sensitivity study with the MACCS [MELCOR Accident Consequence Code System] Reactor Accident Consequence Model, 15:21850 (R;US)
Reactivity accidents: A reassessment of the design-basis events, 15:21788 (R;US)
SCDAP/RELAP5/MOD2 code manual: Volume 4, MATPRO: A library of materials properties for light-water-reactor accident analysis, 15:21842 (R;US)

Reactor Components
Development and validation of a real-time SAFT-UT system for in-service inspection of LWRs, 15:21697 (RA;US)
Effect of decontamination on aging processes and considerations for life extension, 15:21699 (RA;US)
Elastic-plastic fracture mechanics evaluation of light-water-reactor (LWR) alloys, 15:21692 (RA;US)
Evaluation and improvement in nondestructive examination (NDE) reliability for in-service inspection of light water reactors, 15:21695 (RA;US)
Evaluation of advanced and current leak detection systems, 15:21698 (RA;US)

Reactor Cooling Systems
Closeout of IE Bulletin 79-17: Pipe cracks in stagnant borated water systems at PWR [pressurized water reactors] plants, 15:21843 (R;US)
Guillotine breaks indirectly caused by seismically-induced failures, 15:21819 (RA;US)

Reactor Cores
Melt progression, oxidation, and natural convection in a severely damaged reactor core, 15:21845 (R;US)
Precursors to potential severe core damage accidents: 1988 a status report: Appendixes B and C, 15:21840 (R;US)

Reactor Licensing
Historical data summary of the Systematic Assessment of Licensee Performance: Revision 5, 15:21714 (R;US)
Reactor Monitoring Systems
A study on continuous monitering and self-started diagnosis with signal validation using DISKET, 15:21737 (R;JP;In Japanese)
Reactor Operation
Licensee Event Report (LER) compilation for month of January 1990, 15:21715 (R;US)
Reactor Vessels
Current applications of vibration monitoring and neutron noise analysis: Detection and diagnosis of structural degradation of reactor vessel internals resulting from operational aging, 15:21849 (R;US)
Stainless Steels
Long-term aging embrittlement of cast duplex stainless steels in LWR systems, 15:21694 (RA;US)
Steam Generators
STARRS-MMS [Secondary side Transport And Retention of Radioactive Species-modular modeling system] code: Evaluating steam generator tube ruptures: Volume 3, Users manual, Final report, 15:21742 (R;US)
STARRS-MMS [Secondary-Side Transport And Retention of Radioactive Species-Modular Modeling System] code: Evaluating steam generator tube ruptures: Volume 4: Application, Final report, 15:21798 (R;US)
STARRS-MMS [Secondary-Side Transport And Retention of Radioactive Species-Modular Modeling System] code: Evaluating steam generator tube ruptures: Volume 2: Programmer's manual, Final report, 15:21741 (R;US)
PYRIDINES
[Basic properties of coals and other solids]: Quarterly report No. 2, 15:21150 (R;US)
PYROTECHNIC DEVICES
High-speed photography of energetic materials and components with a copper vapor laser, 15:22195 (BA;US)
Pyrotechnic device technology, 15:22470 (R;US)
PYRROLES
Molecular organization and electrical properties of mixed Langmuir-Blodgett multilayer thin films of polypyrrole, 15:22166 (R;US)

Q

QUADRUPOLE LINACS
Design studies of an electrostatic quadrupole channel for transport of a high-brightness H^- beam and comparison with gas focusing, 15:23173 (BA;US)
QUALITY ASSURANCE
Assessment of quality management systems, 15:22295 (RA;CA)
Quality assurance and verification of the MACCS [MELCOR Accident Consequence Code System] code, Version 1.5, 15:21846 (R;US)
Research and development quality assurance planning, 15:23198 (R;US)
Summary results of an assessment of research projects in the Chemical Toxicology Research Program, 15:22768 (R;US)
QUANTUM CHROMODYNAMICS
Critique of practical methods for computer evaluation of the hadron spectrum, 15:22901 (R;US)
Recent results on jet physics and tests of QCD [Quantum Chromodynamics] in e^+e^- annihilation, 15:22892 (R;US)
QUANTUM FIELD THEORY
See also LAGRANGIAN FIELD THEORY
QUANTUM CHROMODYNAMICS
BRST construction of interacting gauge theories of higher spin fields, 15:22910 (R;FR)
QUANTUM MECHANICS
A finite Zitterbewegung model for relativistic quantum mechanics, 15:22980 (R;US)
Center for Atomic, Molecular, and Optical Physics technical activities, 1989, 15:22857 (R;US)
Fermionic molecular dynamics, 15:22977 (R;DE)
QUARKS
Big Bang nucleosynthesis and the quark-hadron transition, 15:22819 (R;US)
Experimental search for free quarks in matter, 15:22896 (R;US)
QUARTZ
Investigation of the determination of respirable quartz on filter media using Fourier transform infrared spectrophotometry, 15:22510 (R;US)
QUASI-ELASTIC SCATTERING
Wigner-Kirkwood expansion of the quasi-elastic nuclear responses and application to spin-isospin responses, 15:22902 (R;FR)
QUATERNARY ALLOY SYSTEMS
Theoretical and experimental study of solid phase miscibility gaps in III/V quaternary alloys: Progress report, April 1, 1987–June 2, 1989, 15:22105 (R;US)
QUEBEC
The implications of climate change for natural resources in Quebec, 15:22507 (R;CA)

R

R-2 REACTOR
LEU silicide programs at Babcock and Wilcox, 15:21749 (RA;US)
RADAR
Description, operation, and maintenance information on joystick and closed-circuit television MPS-36 radar, Meppen Range, Federal Republic of Germany: Technical manual, 15:22329 (R;US)
RADIANT HEATERS
Basic research on radiant burners. Annual report, February 1988-January 1989, 15:21375 (R;US)
RADIATION ACCIDENTS
Emergency reception of accidents and incidents in working with ionizing radiation, 15:22759 (R;NL;In Dutch)
RADIATION BELTS
PROTEL: Design, fabrication, calibration, testing, and satellite integration of a proton telescope. Environmental research paper, 15:22421 (R;US)
RADIATION BURDEN
See RADIATION DOSES
RADIATION DAMAGE (NONBIOLOGIC)
See RADIATION EFFECTS
RADIATION DECONTAMINATION
See DECONTAMINATION
RADIATION DETECTION AND RANGE
See RADAR
RADIATION DOSE DISTRIBUTIONS
See also TEMPORAL DOSE DISTRIBUTIONS
A method for estimating annual dose equivalent to the lung under varying radon progeny conditions, 15:21969 (R;US)
RADIATION DOSEMETERS
See DOSEMETERS
RADIATION DOSES
A comparison of microscopic dose with average dose near high-energy iron ions, 15:22763 (RA;US)
A computer code TERFOC-N to calculate doses to the public due to atmospheric releases of radionuclides in normal operations of nuclear facilities, 15:23213 (R;JP;In Japanese)
An approach to calculating upper bounds on maximum individual doses from the use of contaminated well water following a WIPP [Waste Isolation Pilot Plant] repository breach, 15:21484 (R;US)
Hanford Environmental Dose Reconstruction Project: Monthly report, February 1990, 15:21521 (R;US)
Is natural background or radiation from nuclear power plants leukemogenic?, 15:22745 (R;US)
Skin carcinogenesis following uniform and non-uniform β irradiation, 15:22747 (R;GB)
The influence of fractionation and repair kinetics on radiation tolerance: Studies on rat lung and kidney, 15:22752 (R;NL)

The significance of certain Rustler aquifer parameters for predicting long-term radiation doses from WIPP [Waste Isolation Pilot Plant], 15:21483 (R;US)
Use of RADFETS (Radiation-Sensitive Field Effect Transistor) in radiation dose measurement: Report on three lots prepared for the US Army. Final report, 18 June 1987-18 September 1989, 15:22452 (R;GB)

RADIATION DOSIMETRY
See DOSIMETRY

RADIATION EFFECTS
See also BIOLOGICAL RADIATION EFFECTS
Dosimetry measurement reference data base for LWR pressure vessel irradiation surveillance, 15:21738 (RA;US)
LWR pressure vessel surveillance dosimetry improvement program, 15:21693 (RA;US)

RADIATION EXPOSURE (DOSES)
See RADIATION DOSES

RADIATION HAZARDS
EEG review comments on the geotechnical reports provided by DOE to EEG under the stipulated agreement through March 1, 1983, 15:21485 (R;US)
NIOSH (National Institute for Occupational Safety and Health) testimony on radiation before the Senate Committee on Commerce, Science, and Transportation, by Elliot Harris, June 28, 1977, 15:22761 (R;US)
Potential problems from shipment of high-curie content Contact-Handled Transuranic (CH-TRU) waste to WIPP [Waste Isolation Pilot Plant], 15:21486 (R;US)
Remediation of contaminated soil using heap leach mining technology, 15:21496 (R;US)
Review comments on the report of the Steering Committee on Waste Acceptance Criteria for the Waste Isolation Pilot Plant, 15:21482 (R;US)
The significance of certain Rustler aquifer parameters for predicting long-term radiation doses from WIPP [Waste Isolation Pilot Plant], 15:21483 (R;US)

RADIATION HYGIENE
See RADIATION PROTECTION

RADIATION MONITORING
Reports from the RIVM 1988, 15:22765 (R;NL;In Dutch)

RADIATION PROTECTION
AFRRI (Armed Forces Radiobiology Research Institute) reports, July, August, September 1989. Technical report, 15:22741 (R;US)
Preliminary study of a blanket handling device and evaluation of the feasibility of eliminating the spread of radioactive contamination, 15:23104 (R;FR)
Progress in radiation control technology: Final report, 15:21799 (R;US)

RADIATION PROTECTION GUIDES
See RECOMMENDATIONS

RADIATION SAFETY
See RADIATION PROTECTION

RADIATION SOURCES

LIGHT SOURCES
SYNCHROTRON RADIATION SOURCES
NIOSH (National Institute for Occupational Safety and Health) testimony on radiation before the Senate Committee on Commerce, Science, and Transportation, by Elliot Harris, June 28, 1977, 15:22761 (R;US)

RADIATION TRANSPORT
See also CHARGED-PARTICLE TRANSPORT
Calculations of Auger-cascade-induced reactions with DNA in aqueous solution, 15:22750 (R;US)
STARRS-MMS [Secondary side Transport And Retention of Radioactive Species-modular modeling system] code: Evaluating steam generator tube ruptures: Volume 3, Users manual, Final report, 15:21742 (R;US)
STARRS-MMS [Secondary-Side Transport And Retention of Radioactive Species-Modular Modeling System] code: Evaluating steam generator tube ruptures: Volume 2: Programmer's manual, Final report, 15:21741 (R;US)

RADIOACTIVE AEROSOLS
Modelling airborne dispersion of coarse particulate material, 15:22496 (R;GB)

RADIOACTIVE BIOLOGICAL WASTES
See RADIOACTIVE WASTES

RADIOACTIVE EFFLUENTS
1988 Annual site environmental report, Sandia National Laboratories, Livermore, California, 15:22539 (R;US)
Environmental Radiation Data: Report 53, January-March 1988. Quarterly report, 15:22521 (R;US)
Environmental Radiation Data: Report 54, April-June 1988. Quarterly report, 15:22522 (R;US)
Radioactivity in surface and coastal waters of the British Isles, 1988, 15:22604 (R;GB)
Rocky Flats Plant site environmental report for 1988, January through December 1988, 15:22581 (R;US)

RADIOACTIVE GASEOUS WASTES
See RADIOACTIVE WASTES

RADIOACTIVE MATERIALS
See also FISSION PRODUCTS
RADIOACTIVE WASTES
Defense Decontamination and Decommissioning Program: Program management plan, 15:21475 (R;US)
Environmental monitoring master sampling schedule, January–December 1990, 15:22706 (R;US)
Personal computer based decision support system for routing nuclear spent fuel, 15:21457 (R;US)
Remedial investigations for quarry bulk wastes: Revision 1, 15:21472 (R;US)

RADIOACTIVE PARTICULATES
See RADIOACTIVE AEROSOLS

RADIOACTIVE WASTE DISPOSAL
Actinide speciation, further development and application of laser induced photoacoustic spectroscopy and voltammetry, 15:22204 (R;GB)
Equilibrium leach testing of low level waste. Pt. 1: Effect of backfill, 15:21507 (R;GB)
Gas evolution and migration in repositories: Current status, May 1989, 15:21506 (R;GB)
Nuclear waste: DOE's method for assigning defense waste disposal costs complies with NWPA, 15:21918 (R;US)
Optimisation of treatment, storage and disposal strategies for (unconditioned and conditioned) radioactive waste: (Disposals II), 15:21479 (R;GB)
Post-closure resaturation of a deep radioactive waste repository, 15:21509 (R;GB)
Progress report for 1987/88 from the Waste Treatment and Disposal Working Party covering joint BNFL/DoE funded work, 15:21477 (R;GB)
Radioactive waste disposal: Waste Isolation Pilot Plants (WIPP). March 1978-November 1989 (Citations from the NTIS data base). Report for Mar 78-Nov 89, 15:21520 (R;US)
STRAW: a source-term code for buried radioactive waste, 15:21510 (R;GB)
Small angle neutron scattering studies of diffusion and permeation through pores in clays, 15:22548 (R;GB)
Studies of environmental radioactivity in Cumbria - Pt. 18: Plutonium and americium behaviour in Cumbrian near-shore waters, 15:22599 (R;GB)
The detection of boundaries in leaky aquifers, 15:21478 (R;GB)

RADIOACTIVE WASTE FACILITIES

HIGH-LEVEL RADIOACTIVE WASTES
INTERMEDIATE-LEVEL RADIOACTIVE WASTES
LOW-LEVEL RADIOACTIVE WASTES
RADIOACTIVE EFFLUENTS

Activity Levels
Activity inventory of the activated decommissioning waste in the Olkiluoto nuclear power plant, 15:21851 (R;FI)

Air Pollution
Health assessment for US Radium-West Orange, Orange, Essex County, New Jersey, Region 2. CERCLIS No. NJD980654172. Preliminary report, 15:21519 (R;US)

Ground Disposal
Environmental regulatory update table, February 1990, 15:22551 (R;US)
Environmental regulatory update table, January 1990, 15:22550 (R;US)

Land Pollution
Health assessment for US Radium-West Orange, Orange, Essex County, New Jersey, Region 2. CERCLIS No. NJD980654172. Preliminary report, 15:21519 (R;US)

Mass Transfer
The transportation operations system: A description, 15:21456 (R;US)

Minimization
Hazardous waste: DOD efforts to reduce waste, 15:21917 (R;US)
Remediation of contaminated soil using heap leach mining technology, 15:21496 (R;US)

Monitored Retrievable Storage
Temporary storage area characterization report: Revision 1, 15:21471 (R;US)

Radioactive Waste Disposal
A demonstration of the applicability of implementing the enhanced Remedial Action Priority System (RAPS) for environmental releases, 15:21522 (R;US)
Analysis of proposed post-closure alternatives for the Bear Creek Burial Grounds, 15:21515 (R;US)
Remedial actions at the former Union Carbide Corporation uranium mill sites, Rifle, Garfield County, Colorado: Final environmental impact statement: Volume 1, Text, 15:21539 (R;US)
Remedial investigations for quarry bulk wastes: Revision 1, 15:21472 (R;US)
Resource conservation and recovery act activities for treatment, storage, and/or disposal units operating at the Hanford Site, 15:21534 (R;US)
The use of additives for reducing hydrogen yield in mortar containing slag and chloride salts, 15:21462 (R;US)

Radioactive Waste Management
Feasibility study for management of the bulk wastes at the Weldon Spring quarry, Weldon Spring, Missouri, 15:21473 (R;US)
Minutes from Department of Energy Hazardous Waste Remedial Actions Program Technology Demonstration Program FY 1990 waste site review and ranking meeting, 15:21465 (R;US)
Proposed plan for the management of bulk wastes at the Weldon Spring quarry, Weldon Spring, Missouri, 15:21474 (R;US)

Radioactive Waste Storage
Resource conservation and recovery act activities for treatment, storage, and/or disposal units operating at the Hanford Site, 15:21534 (R;US)

Synroc Process
Synthesis and microstructural examination of SYNROC B, 15:21494 (RA;DE)

Transport
Temporary storage area characterization report: Revision 1, 15:21471 (R;US)

Underground Disposal
Calculation of thermodynamic properties for monomeric U(IV) hydrolysis products at 298.15 K and zero ionic strength, 15:21499 (R;US)
Cost and uncertainty optimized design of performance-prediction experiments for a nuclear waste container, 15:21470 (R;US)
The significance of certain Rustler aquifer parameters for predicting long-term radiation doses from WIPP [Waste Isolation Pilot Plant], 15:21483 (R;US)

RADIOACTIVITY

RADON
Indoor radon pollution: Control and mitigation. June 1978-December 1989 (Citations from the NTIS data base). Report for June 1978-December 1989, 15:22534 (R;US)
Radon fundamentals and the effectiveness of coatings in reducing soil gas flow through block basement walls. Report for May 1988-March 1989, 15:22526 (R;US)
Results of the independent verification of radiological remedial action at 165 North 1st West Street, Monticello, Utah (MS00014), 15:21546 (R;US)
Results of the independent verification of radiological remedial action at 217 South 2nd East Street, Monticello, Utah (MS00097), 15:21517 (R;US)
Results of the independent verification of radiological remedial action at 281 East 3rd South Street, Monticello, Utah (MS00138), 15:21545 (R;US)
Role of ductile shearing in the concentration of radon in the Brookneal zone, Virginia, 15:22586 (J;US)

RADON 220
Generation and mobility of radon in soil: Annual technical progress report, March 1987–February 1990, 15:21540 (R;US)

RADON 222
A method for estimating annual dose equivalent to the lung under varying radon progeny conditions, 15:21969 (R;US)
Exhalation velocity of radon-222 of Dutch building materials and the influence of paint systems, 15:22030 (R;NL;In Dutch)
Final radon testing results for the Residential Standards Demonstration Progam, 15:21963 (R;US)
Generation and mobility of radon in soil: Annual technical progress report, March 1987–February 1990, 15:21540 (R;US)
Radon transport in dry, cracked soil: Two-dimensional, finite element model, 15:22578 (R;US)
Whole body counting of radon daughters, 15:22748 (R;US)

RAILGUN ACCELERATORS
A 10-stage reconnection demonstration launcher, 15:22035 (R;US)
Application of railgun principle to high-velocity hydrogen pellet injection for magnetic fusion reactor refueling: Technical progress report, 15:23109 (R;US)
Design and performance of a multi-stage cylindrical reconnection launcher, 15:22036 (R;US)
Diagnostics and firing control for the cylindrical reconnection launcher, 15:22037 (R;US)
Exploratory development of the reconnection launcher, 1986–1990, 15:22038 (R;US)
Future trends in pulsed power technology at the Center for Electromechanics at the University of Texas at Austin, 15:22403 (BA;US)
Plasma armatures in large bore launchers, 15:23171 (BA;US)
Results from recent hydrogen pellet acceleration studies with a 2-m railgun, 15:23106 (R;US)
Switching devices used in the lethality test system, 15:22404 (BA;US)
Ultimate velocities for induction launchers, 15:22406 (BA;US)

RAIN WATER
Meteorological testing and analysis of sampling equipment for wet deposition, 15:22502 (R;DE;In German)

RAMAN SPECTRA
Modelling Doppler broadening in Raman propagation, 15:22864 (R;US)

RAMAN SPECTROSCOPY
Method for estimating maximum exposured temperature of coke by laser Raman spectometry, 15:21128 (RA;JP;In Japanese)

RARE EARTH ALLOYS
See also PRASEODYMIUM ALLOYS
A review of the literature on the toxicity of rare-earth metals as it pertains to the engineering demonstration system surrogate testing: Revision 1, 15:22129 (R;US)

RARE EARTH COMPOUNDS
See also EUROPIUM COMPOUNDS
GADOLINIUM COMPOUNDS
LANTHANUM COMPOUNDS
PRASEODYMIUM COMPOUNDS
Electronically induced phase transformations. Final report, 1 October 1975-30 September 1980, 15:22971 (R;US)

RARE EARTH NUCLEI
See also CERIUM 129
CERIUM 130
CERIUM 131
ERBIUM 162
LANTHANUM 147
Alpha-particles as probes of nuclear shape in the rare earths and structure effects on proton emission in the mass 80 region, 15:22914 (R;US)

RARE EARTHS
See also THULIUM
The distribution and uptake of rare-earth elements in the food chain and their use as analogues for the transuranic elements: A literature review, 15:22742 (R;GB)
Weldability and microstructural analysis of nuclear-grade austenitic stainless steels, 15:22133 (D;US)

RATE STRUCTURE
Reasons for decision [in the matter of] Interprovincial Pipe Line Company, a division of Interhome Energy Inc. A toll design study and recommendations in response to NEB [National Energy Board] reasons for Decision RH-4-89, 15:21336 (R;CA)

RATS
Survival after total-body irradiation. 1. Effects of partial small bowel shielding, 15:22739 (R;US)

RAW MATERIALS
Study on homogenizing methods of bulk density in coke oven, 15:21129 (RA;JP;In Japanese)

RAYLEIGH SCATTERING
Measurement of the stimulated thermal Rayleigh scattering instability: Revision 1, 15:22486 (R;US)

REACTOR ACCIDENTS
See also ATWS
An exploratory sensitivity study with the MACCS [MELCOR Accident Consequence Code System] Reactor Accident Consequence Model, 15:21850 (R;US)
Probabilistic trajectory and dose analysis for Finland due to hypothetical radioactive releases at Sosnovyy Bor, 15:21745 (R;FI)
Quality assurance and verification of the MACCS [MELCOR Accident Consequence Code System] code, Version 1.5, 15:21846 (R;US)
Reactivity accidents: A reassessment of the design-basis events, 15:21788 (R;US)
Reactor accident diagnostic expert system: DISKET, 15:21803 (R;JP;In Japanese)
SCDAP/RELAP5/MOD2 code manual: Volume 4, MATPRO: A library of materials properties for light-water-reactor accident analysis, 15:21842 (R;US)

REACTOR CHANNELS
Experimental investigation of onset of nucleate boiling in this rectangular channels, 15:21772 (RA;US)

REACTOR COMPONENTS
See also BREEDING BLANKETS
FUEL ELEMENTS
REACTOR CHANNELS
REACTOR COOLING SYSTEMS
REACTOR CORES
Acoustic emission - flaw relationships for in-service monitoring of nuclear reactor pressure boundaries, 15:21696 (RA;US)
Aging assessment and mitigation for major LWR components, 15:21810 (RA;US)
Degraded piping program - Phase II. Battelle Columbus Division, 15:21691 (RA;US)
Development and validation of a real-time SAFT-UT system for in-service inspection of LWRs, 15:21697 (RA;US)
Effect of decontamination on aging processes and considerations for life extension, 15:21699 (RA;US)
Elastic-plastic fracture mechanics evaluation of light-water-reactor (LWR) alloys, 15:21692 (RA;US)
Evaluation and improvement in nondestructive examination (NDE) reliability for in-service inspection of light water reactors, 15:21695 (RA;US)
Evaluation of advanced and current leak detection systems, 15:21698 (RA;US)
Lessons in solid-state kinetics from nuclear energy research, 15:21728 (J;US)
Seismic fragility of nuclear power plant components (Phase II): Volume 3, Switchgear, I and C panels (NSSS) and relays, 15:21837 (R;US)
The effects of aging on the fire vulnerability of nuclear power plant components, 15:21812 (RA;US)

REACTOR CONTROL SYSTEMS
Development of a robust model-based reactivity control system, 15:21734 (R;US)
Seismic fragility of nuclear power plant components (Phase II): Volume 3, Switchgear, I and C panels (NSSS) and relays, 15:21837 (R;US)
Using formal methods to develop a paradigm for software design, 15:21733 (R;US)

REACTOR CONTROL THEORY
See REACTOR KINETICS

REACTOR COOLING SYSTEMS
See also PRIMARY COOLANT CIRCUITS
RHR SYSTEMS
Application of signature analysis for determining the operational readiness of motor-operated valves under blowdown test conditions, 15:21828 (RA;US)
Closeout of IE Bulletin 79-17: Pipe cracks in stagnant borated water systems at PWR [pressurized water reactors] plants, 15:21843 (R;US)
Environmentally assisted cracking in light water reactors, 15:21830 (RA;US)
Guillotine breaks indirectly caused by seismically-induced failures, 15:21819 (RA;US)
Ichthyoplankton entrainment at Wylfa power station, Anglesey and implications for a further siting proposal, 15:21705 (R;GB)
Piping and fitting dynamic reliability program, 15:21820 (RA;US)
Piping support and gate valve behavior during high level HDR simulated seismic tests, 15:21833 (RA;US)
Probability of crack-induced failure in the BWR recirculation piping, 15:21815 (RA;US)
SHAM: High-level seismic tests of piping at the HDR, 15:21826 (RA;US)
Shippingport aging studies - results and plans, 15:21836 (RA;US)
Thermal-hydraulic analysis of the OSURR pool for power upgrade with natural convection core cooling, 15:21773 (RA;US)
Valve testing for UK PWR safety applications, 15:21832 (RA;US)

REACTOR CORES
See also COUPLED REACTOR CORES

Accidents
Melt progression, oxidation, and natural convection in a severely damaged reactor core, 15:21845 (R;US)

Benchmarks
A benchmark for investigating the radial dependence of C/E for control rod worths in large decoupled cores, 15:21732 (R;US)

Configuration
Study on temperature coefficient of reactivity in JUCA light-water moderated and reflected core effect of moderate/fuel ratio and core shape on this quantity, 15:21764 (RA;US)

Criticality
Measurements and analysis of critical experiments in the La Reina reactor using medium enrichment uranium fuel, 15:21774 (RA;US)

Heat Transfer
Summary of the studies carried out for the definition of the maximum allowed heat flux in the BR2 reactor, 15:21770 (RA;US)
Thermal-hydraulic aspects of flow inversion in a research reactor, 15:21771 (RA;US)

Hydraulics
Thermal-hydraulic aspects of flow inversion in a research reactor, 15:21771 (RA;US)

Modifications
A study of the effect of fabrication variables on the quality of fuel plates, 15:21748 (RA;US)
Analysis of uranium silicide fuel for the Ford nuclear reactor, 15:21783 (RA;US)
Comparison of calculated and measured irradiated wire data for high-enrichment uranium (HEU) and mixed HEU/LEU cores in the ORR, 15:21762 (RA;US)
Examination of U_3Si_2-Al fuel elements from the Oak Ridge Research Reactor, 15:21756 (RA;US)
Experimental investigation of onset of nucleate boiling in this rectangular channels, 15:21772 (RA;US)
Fabrication and irradiation testing of reduced enrichment fuels for Canadian research reactors, 15:21760 (RA;US)
Fuel core moderate enrichment uranium (MEU) fuel demonstration in the JMTR, 15:21763 (RA;US)
Irradiation and nuclear characteristics measurements of JRR-4 LEU fuel elements, 15:21757 (RA;US)
LEU silicide programs at Babcock and Wilcox, 15:21749 (RA;US)
MEU and LEU fuel elements - Nukem's future policy, 15:21750 (RA;US)
MTR fuel development at CERCA status as of October 1986, 15:21751 (RA;US)
Neutronic scoping calculations for OSURR core design with standardized U_3Si_2 fuel plates, 15:21768 (RA;US)
Phase in U-Si alloys, 15:21747 (RA;US)
Physical behavior of the high flux engineering test reactor, 15:21784 (RA;US)
Pilot plant production at Riso of LEU silicide fuel for the Danish reactor DR3, 15:21782 (RA;US)
Post-irradiation examination of low-enrichment uranium (LEU) miniplates in the JMTR, 15:21754 (RA;US)
Preliminary low-enrichment uranium (LEU) fuel cycle analyses for the Belgian BR2 reactor, 15:21765 (RA;US)
Progress report on LEU fuel testing in CEA reactors, 15:21758 (RA;US)
Quality assurance and inspection techniques in use at Babcock and Wilcox, 15:21752 (RA;US)
RERTR program fuel development and testing - the past year and the next, 15:21759 (RA;US)
Refueling the RPI reactor facility with SPERT(F-1) fuel rods, 15:21767 (RA;US)
Selection of fuel type and core pattern and application for low-enrichment uranium (LEU)-licensing of the Danish reactor DR 3, 15:21766 (RA;US)
Standardization of specifications and inspection procedures for low-enrichment uranium (LEU) plate-type research reactor fuels, 15:21753 (RA;US)
The German AF-Program status and final activities, 15:21746 (RA;US)
The effect of fabrication variables on the irradiation performance of uranium silicide dispersion fuel plates, 15:21755 (RA;US)
The transition phase of the whole-core demonstration at the Oak Ridge Research Reactor, 15:21761 (RA;US)
Thermal-hydraulic analysis of the OSURR pool for power upgrade with natural convection core cooling, 15:21773 (RA;US)

Optimization
Optimization of the PS-2 core configuration for the ANS [Advanced Neutron Source] Reactor, 15:21781 (R;US)

Reactor Core Disruption
Precursors to potential severe core damage accidents: 1988 a status report: Appendixes B and C, 15:21840 (R;US)

Specifications
Status of the design of the Munich compact core with involute-shaped fuel plates, 15:21769 (RA;US)

REACTOR FUEL ELEMENTS
See FUEL ELEMENTS

REACTOR FUELS
See NUCLEAR FUELS

REACTOR INSTRUMENTATION
Seismic fragility of nuclear power plant components (Phase II): Volume 3, Switchgear, I and C panels (NSSS) and relays, 15:21837 (R;US)

REACTOR KINETICS
Study on temperature coefficient of reactivity in JUCA light-water moderated and reflected core effect of moderate/fuel ratio and core shape on this quantity, 15:21764 (RA;US)

REACTOR LICENSING
Historical data summary of the Systematic Assessment of Licensee Performance: Revision 5, 15:21714 (R;US)

REACTOR MATERIALS

Problems in the analysis and characterization of bitumen and heavy oils, 15:21427 (RA;US)
Chemical Properties
Distribution and geological characteristics of heavy oil in China, 15:21185 (RA;US)
Chemical Reactions
Laboratory simulation of thermal changes in heavy crudes during thermal recovery, 15:21248 (RA;US)
Coking
Noncatalytic heavy crude upgrading, 15:21254 (RA;US)
Combustion
Suspension burning of heavy residues and petroleum coke in the limits of environmental standards, 15:21349 (RA;US)
Deasphalting
High conversion upgrading of extra-heavy oils by a new process combination, 15:21261 (RA;US)
Noncatalytic heavy crude upgrading, 15:21254 (RA;US)
Upgrading and enhanced recovery of tar sand bitumen and heavy crude using the ART process, 15:21260 (RA;US)
Dehydration
Techniques for treating and dehydrating eastern Venezuelan heavy oil, 15:21224 (RA;US)
Dilution
The use of diluents in S.A. MENEVEN's extra heavy crude oil production and transportation operations, 15:21346 (RA;US)
Emulsification
Heavy and extra-heavy crude oil-in-water emulsions for transportation: Their formulation, formation, and characterization, 15:21343 (RA;US)
Heavy oil emulsion treating in Canada, 15:21335 (RA;US)
The preparation of heavy oil-in-water emulsions for transportation purposes, 15:21342 (RA;US)
Transportation of viscous crude oil-in-water emulsions through pipes, 15:21341 (RA;US)
Exploration
Geotomography for exploration of heavy oil deposits, 15:21383 (RA;US)
Geology
Heavy oil reserves in the Monterey Formation offshore California - Geological and engineering aspects, 15:21191 (RA;US)
Heavy oils of India and the problems in their production, 15:21210 (RA;US)
Hydraulic Transport
Heavy and extra-heavy crude oil-in-water emulsions for transportation: Their formulation, formation, and characterization, 15:21343 (RA;US)
Heavy crude transportation, 15:21333 (RA;US)
Heavy oil emulsion treating in Canada, 15:21335 (RA;US)
Heavy oil transportation: A challenge, 15:21334 (RA;US)
Pipelining of heavy crude oils using core annular flow, 15:21347 (RA;US)
Sizing hot pipelines for the transport of hot emulsified heavy crude oil, 15:21344 (RA;US)
The preparation of heavy oil-in-water emulsions for transportation purposes, 15:21342 (RA;US)
The use of diluents in S.A. MENEVEN's extra heavy crude oil production and transportation operations, 15:21346 (RA;US)
Transportation of Bombay high crude through Salaya-Mathura pipeline system, 15:21348 (RA;US)
Transportation of extra heavy crude oils by heating or dilution, 15:21345 (RA;US)
Transportation of viscous crude oil-in-water emulsions through pipes, 15:21341 (RA;US)
Hydrocracking
A new improved HDM catalyst for heavy crude oils, 15:21273 (RA;US)
Advances in the catalytic hydroprocessing of residues and heavy oils, 15:21270 (RA;US)
CANMET hydrocracking - A Canadian story, 15:21266 (RA;US)
Catalytic hydroprocessing of syncrudes: R and D interests at CANMET, 15:21271 (RA;US)
Deep conversion of heavy oil and bitumen via VEBA-Combi-Cracking - An update, 15:21264 (RA;US)
Hydrotreatment of heavy crudes and residuals, 15:21269 (RA;US)
Idemitsu hydrocracking process produces distillate from residual oil, 15:21272 (RA;US)
Mild resid hydrocracking for middle distillates: A new heavy oil upgrading alternative, 15:21265 (RA;US)
Potential for asphaltenic bottom cracking technology in upgrading ultra-heavy oil, 15:21256 (RA;US)
Upgrading of bitumen by hydropyrolysis - A process for low coke and high syncrude yields, 15:21263 (RA;US)
Microbial Eor
A biotechnological alternative for recovering heavy oil, 15:21212 (RA;US)
Origin
The interaction of hot geothermal brines and crude petroleum, 15:21198 (RA;US)
The role of lithology in the generation of heavy oils: A laboratory simulation study, 15:21199 (RA;US)
Petroleum Refineries
Site selection for a heavy oil upgrader, 15:21209 (RA;US)
Processing
Advances in heavy oil processing, 15:21257 (RA;US)
Grassroot upgrading complex for processing Orinoco heavy crude, 15:21251 (RA;US)
Techniques for treating and dehydrating eastern Venezuelan heavy oil, 15:21224 (RA;US)
Production
Offshore California heavy crude: Potential and production, 15:21235 (RA;US)
Offshore production and transportation of heavy oil, 15:21236 (RA;US)
Recovery
Heavy oil recovery methods - A classification system, 15:21410 (RA;US)
Refining
Advances in heavy oil processing, 15:21257 (RA;US)
Concepts for heavy metal handling in heavy oil upgrading processes, 15:21277 (RA;US)
HDH process for heavy crude upgrading, 15:21262 (RA;US)
High conversion H-Oil ® processing of Cold Lake and Lloydminster residues in support of Husky bi-provincial project, 15:21414 (RA;US)
Kerr-McGee's Rose® process expands on proven extraction technology, 15:21275 (RA;US)
New tools for assessing the economic value of heavy crude oils and fractions, 15:21268 (RA;US)
Small scale upgraders integrated with field production facilities, 15:21253 (RA;US)

Staged heavy crude upgrading, 15:21252 (RA;US)
Technology available for residue upgrading, 15:21255 (RA;US)
The Allied process for upgrading heavy crudes, 15:21267 (RA;US)
The Gulf Canada donor refined bitumen (DRB) process, 15:21259 (RA;US)
The bi-provincial project primary upgrading technology: Why ebullated bed hydrocracking (H-Oil®) was chosen, 15:21413 (RA;US)
Upgrading and enhanced recovery of tar sand bitumen and heavy crude using the ART process, 15:21260 (RA;US)

Reserves
An estimate of world resources of heavy crude oil and natural bitumen, 15:21184 (RA;US)

Resource Potential
The production of heavy crude oil reduces fuel oil imports in Suriname, 15:21317 (RA;US)

Sample Preparation
Problems in the analysis and characterization of bitumen and heavy oils, 15:21427 (RA;US)

Sampling
Problems in the analysis and characterization of bitumen and heavy oils, 15:21427 (RA;US)

Solvent Extraction
High conversion upgrading of extra-heavy oils by a new process combination, 15:21261 (RA;US)

Steam Soak Processes
Heavy oil recovery improvement, 15:21218 (RA;US)

Supply and Demand
Heavy crude oil markets, 15:21314 (RA;US)
Heavy versus light oil: Recent changes in refiners perspectives, 15:21316 (RA;US)

Temperature Effects
Laboratory simulation of thermal changes in heavy crudes during thermal recovery, 15:21248 (RA;US)

Thermal Cracking
First year operating experience of the LAGOVEN Amuay refinery flexicoker, 15:21276 (RA;US)
High conversion upgrading of extra-heavy oils by a new process combination, 15:21261 (RA;US)

Transport
Offshore production and transportation of heavy oil, 15:21236 (RA;US)

Uses
The production of heavy crude oil reduces fuel oil imports in Suriname, 15:21317 (RA;US)

RESIDUES (RADIOACTIVE)
See RADIOACTIVE WASTES

RESINS
Half-scale solidification experiment of spent ion exchange resins, 15:21535 (R;FI;In Finnish)

RESISTAL
See COPPER BASE ALLOYS

RESISTIVITY LOGGING
Relationship of wettability to the Archie saturation exponent, 15:21241 (RA;US)

RESONANCE CAVITIES
See CAVITY RESONATORS

RESONANCE IONIZATION MASS SPECTROSCOPY
Continuous-wave double-resonance ionization mass spectrometry, 15:22577 (RA;US)

RESONANCE STATES

Sandia Technology: Volume 14, No. 1, 15:21915 (R;US)

SANDSTONES
Modelling of a diffusion-sorption experiment on sandstone, 15:22579 (R;CH)

SANITARY LANDFILLS
Health assessment for Hyde Park Landfill National Priorities List (NPL) site, Niagara Falls, New York, Region 2. CERCLIS No. NYD000831644. Final report, 15:22660 (R;US)

Air Pollution
Health assessment for Combe Fill South Landfill, Morris County, New Jersey, Region 2. CERCLIS No. NJD094966611. Final report, 15:22626 (R;US)
Health assessment for Islip Sanitary Landfill, Suffolk County, New York, Region 2. CERCLIS No. NYD980506901. Preliminary report, 15:22658 (R;US)
Health assessment for Juncos Landfill, Juncos, Puerto Rico, Region 2. CERCLIS No. PRD980512362. Final report, 15:22529 (R;US)
Health assessment for Port Washington Landfill, North Hempstead, New York, Region 2. CERCLIS No. NYD980654206. Preliminary report, 15:22703 (R;US)
Health assessment for Syosset Landfill, Nassau County, Syosset, New York, Region 2. CERCLIS No. NYD000511360. Preliminary report, 15:22693 (R;US)

Environmental Exposure
Health assessment for GEMS Landfill National Priorities List (NPL) site, Gloucester Township, Camden County, New Jersey, Region 2. CERCLIS No. NJD980529192. Final report, 15:21900 (R;US)

Implementation
Request for interim approval to operate 218-E-12B Trench 94 as a chemical waste landfill for disposal of polychlorinated biphenyl wastes in submarine reactor compartments, 15:21476 (R;US)

Land Pollution
Health assessment for Barceloneta Landfill, Florida Afuefra, Puerto Rico, Region 2. CERCLIS No. PRD98059129. Preliminary report, 15:22688 (R;US)
Health assessment for Claremont Poly Chemical Corp., Nassau County, Old Bethpage, New York, Region 2. CERCLIS No. NYD002044584. Preliminary report, 15:22673 (R;US)
Health assessment for Colesville Landfill, Broome County, Colesville, New York, Region 2. CERCLIS No. NYD980768691. Preliminary report, 15:22674 (R;US)
Health assessment for Combe Fill North Landfill, Mount Olive Township, New Jersey, Region 2. CERCLIS No. NJD980530596. Final report, 15:22625 (R;US)
Health assessment for Cortese Landfill, Sullivan County, Tusten, New York, Region 2. CERCLIS No. NYD980528475. Preliminary report, 15:22569 (R;US)
Health assessment for D'Imperio Property Site, Hamilton Township, New Jersey, Region 2. CERCLIS No. NJD980529416. Final report, 15:22629 (R;US)
Health assessment for F.M.C. Corporation, Orleans County, Shelby, New York, Region 2. CERCLIS No. NYD000511857. Preliminary report, 15:22570 (R;US)
Health assessment for General Electric Wiring Devices, Juana Diaz, Puerto Rico, Region 2. CERCLIS No. PRD090282757. Final report, 15:22573 (R;US)
Health assessment for Hooker Chemical (102nd Street Landfill), Niagara Falls, New York, Region 2. CERCLIS No. NYD980506810. Preliminary report, 15:22661 (R;US)
Health assessment for Horstmann's Dump, East Hanover, New Jersey, Region 2. CERCLIS No. NJD981084577. Preliminary report, 15:22556 (R;US)
Health assessment for Jones Sanitation Landfill (Jones Septic Site), Hyde Park, Dutchess County, New York, Region 2. CERCLIS No. NYD980534556. Preliminary report, 15:22572 (R;US)
Health assessment for Juncos Landfill, Juncos, Puerto Rico, Region 2. CERCLIS No. PRD980512362. Final report, 15:22529 (R;US)
Health assessment for Kin-Buc Landfill, Edison Township, New Jersey, Region 2. CERCLIS No. NJD049860836. Final report, 15:22637 (R;US)
Health assessment for Lone Pine Landfill National Priorities List (NPL) site, Freehold, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD980505424. Final report, 15:22639 (R;US)
Health assessment for Mannheim Avenue Dump, Galloway Township, New Jersey, Region 2. CERCLIS No. NJD980654180. Preliminary report, 15:22641 (R;US)
Health assessment for Monroe Township Landfill, Monroe, New Jersey, Region 2. CERCLIS No. NJD980505671. Preliminary report, 15:22642 (R;US)
Health assessment for PJP Landfill, Judson County, Jersey City, New Jersey, Region 2. CERCLIS No. NJD980505648. Preliminary report, 15:22648 (R;US)
Health assessment for Ringwood Mines/Landfill National Priorities List (NPL) site, Ringwood, Passaic County, New Jersey, Region 2. CERCLIS No. NJD980529739. Final report, 15:22650 (R;US)

Health assessment for S-Area Landfill/Hooker, Niagara Falls, New York, Region 2. CERCLIS No. NYD000000001. Preliminary report, 15:22567 (R;US)
Health assessment for Sayreville Landfill, Middlesex County, Sayreville, New Jersey, Region 2. CERCLIS No. NJD980505754. Preliminary report, 15:22653 (R;US)
Health assessment for Tabernacle Drum Dump National Priorities List (NPL) site, Tabernacle Township, Burlington County, New Jersey, Region 2. CERCLIS No. NJD980761357. Final report, 15:22656 (R;US)
Health assessment for Volney Landfill, Volney, New York, Region 2. CERCLIS No. NYD980509376. Final report, 15:22691 (R;US)
Health assessment for Warwick Landfill, Orange County, Warwick, New York, Region 2. CERCLIS No. NYD980506679. Preliminary report, 15:22690 (R;US)
Health assessment for Woodlands Route 72 Dump, Woodland Township, Burlington County, New Jersey, Region 2. Cerclis No. NJD980505879. Preliminary report, 15:22617 (R;US)

Remedial Action

Health assessment for Combe Fill South Landfill, Morris County, New Jersey, Region 2. CERCLIS No. NJD094966611. Final report, 15:22626 (R;US)

Water Pollution

Health assessment for Barceloneta Landfill, Florida Afuefra, Puerto Rico, Region 2. CERCLIS No. PRD98059129. Preliminary report, 15:22688 (R;US)
Health assessment for Batavia Landfill, Genesee County, Batavia, New York, Region 2. CERCLIS No. NYD980507693. Preliminary report, 15:22670 (R;US)
Health assessment for Claremont Poly Chemical Corp., Nassau County, Old Bethpage, New York, Region 2. CERCLIS No. NYD002044584. Preliminary report, 15:22673 (R;US)
Health assessment for Colesville Landfill, Broome County, Colesville, New York, Region 2. CERCLIS No. NYD980768691. Preliminary report, 15:22674 (R;US)
Health assessment for Combe Fill North Landfill, Mount Olive Township, New Jersey, Region 2. CERCLIS No. NJD980530596. Final report, 15:22625 (R;US)
Health assessment for Combe Fill South Landfill, Morris County, New Jersey, Region 2. CERCLIS No. NJD094966611. Final report, 15:22626 (R;US)
Health assessment for Cortese Landfill, Sullivan County, Tusten, New York, Region 2. CERCLIS No. NYD980528475. Preliminary report, 15:22569 (R;US)
Health assessment for D'Imperio Property Site, Hamilton Township, New Jersey, Region 2. CERCLIS No. NJD980529416. Final report, 15:22629 (R;US)
Health assessment for F.M.C. Corporation, Orleans County, Shelby, New York, Region 2. CERCLIS No. NYD000511857. Preliminary report, 15:22570 (R;US)
Health assessment for Fort Dix Sanitary Landfill, Pemberton Township, New Jersey, Region 2. CERCLIS No. NJ2210020275. Preliminary report, 15:22634 (R;US)
Health assessment for General Electric Wiring Devices, Juana Diaz, Puerto Rico, Region 2. CERCLIS No. PRD090282757. Final report, 15:22573 (R;US)
Health assessment for Hertel Landfill Inc., Ulster County, Plattekill, New York, Region 2. CERCLIS No. NYD980780779. Preliminary report, 15:22662 (R;US)
Health assessment for Hooker Chemical (102nd Street Landfill), Niagara Falls, New York, Region 2. CERCLIS No. NYD980506810. Preliminary report, 15:22661 (R;US)
Health assessment for Horstmann's Dump, East Hanover, New Jersey, Region 2. CERCLIS No. NJD981084577. Preliminary report, 15:22556 (R;US)
Health assessment for Islip Sanitary Landfill, Suffolk County, New York, Region 2. CERCLIS No. NYD980506901. Preliminary report, 15:22658 (R;US)
Health assessment for Johnstown City Landfill, Fulton County, Johnstown, New York, Region 2. CERCLIS No. NYD980506927. Preliminary report, 15:22677 (R;US)
Health assessment for Jones Sanitation Landfill (Jones Septic Site), Hyde Park, Dutchess County, New York, Region 2. CERCLIS No. NYD980534556. Preliminary report, 15:22572 (R;US)
Health assessment for Kin-Buc Landfill, Edison Township, New Jersey, Region 2. CERCLIS No. NJD049860836. Final report, 15:22637 (R;US)
Health assessment for Lone Pine Landfill National Priorities List (NPL) site, Freehold, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD980505424. Final report, 15:22639 (R;US)
Health assessment for Ludlow Landfill National Priorities List (NPL) site, Clayville, Oneida County, New York, Region 2. CERCLIS No. NYD013468939. Final report, 15:22680 (R;US)
Health assessment for Mannheim Avenue Dump, Galloway Township, New Jersey, Region 2. CERCLIS No. NJD980654180. Preliminary report, 15:22641 (R;US)
Health assessment for Monroe Township Landfill, Monroe, New Jersey, Region 2. CERCLIS No. NJD980505671. Preliminary report, 15:22642 (R;US)
Health assessment for North Sea Landfill, Suffolk County, North Sea, New York, Region 2. CERCLIS No. NYD980762520. Preliminary report, 15:22684 (R;US)
Health assessment for PJP Landfill, Judson County, Jersey City, New Jersey, Region 2. CERCLIS No. NJD980505648. Preliminary report, 15:22648 (R;US)
Health assessment for Port Washington Landfill, North Hempstead, New York, Region 2. CERCLIS No. NYD980654206. Preliminary report, 15:22703 (R;US)
Health assessment for Ramapo Town Landfill, Rockland County, Ramapo, New York, Region 2. CERCLIS No. NYD000511493. Preliminary report, 15:22702 (R;US)
Health assessment for Ringwood Mines/Landfill National Priorities List (NPL) site, Ringwood, Passaic County, New Jersey, Region 2. CERCLIS No. NJD980529739. Final report, 15:22650 (R;US)
Health assessment for S-Area Landfill/Hooker, Niagara Falls, New York, Region 2. CERCLIS No. NYD000000001. Preliminary report, 15:22567 (R;US)
Health assessment for SMS Instruments, Inc., Deer Park, New York, Region 2. CERCLIS No. NYD001533165. Preliminary report, 15:22696 (R;US)
Health assessment for Sayreville Landfill, Middlesex County, Sayreville, New Jersey, Region 2. CERCLIS No. NJD980505754. Preliminary report, 15:22653 (R;US)
Health assessment for Sharkey Landfill, Troy Hills, New Jersey, Region 2. CERCLIS No. NJD980505762. Final report, 15:22654 (R;US)
Health assessment for Syosset Landfill, Nassau County, Syosset, New York, Region 2. CERCLIS No. NYD000511360. Preliminary report, 15:22693 (R;US)
Health assessment for Tabernacle Drum Dump National Priorities List (NPL) site, Tabernacle Township, Burlington County, New Jersey, Region 2. CERCLIS No. NJD980761357. Final report, 15:22656 (R;US)
Health assessment for Volney Landfill, Volney, New York, Region 2. CERCLIS No. NYD980509376. Final report, 15:22691 (R;US)
Health assessment for Warwick Landfill, Orange County, Warwick, New York, Region 2. CERCLIS No. NYD980506679. Preliminary report, 15:22690 (R;US)
Health assessment for Woodland Route 532 Dump, Woodland Township, Burlington County, New Jersey, Region 2. CERCLIS No. NJD980505887. Preliminary report, 15:22657 (R;US)
Health assessment for Woodlands Route 72 Dump, Woodland Township, Burlington County, New Jersey, Region 2. Cerclis No. NJD980505879. Preliminary report, 15:22617 (R;US)
Health assessment for richardson Hill Landfill, Delaware County, Sidney, New York, Region 2. CERCLIS No. NYD980507735. Preliminary report, 15:22701 (R;US)

SAPHIR REACTOR

LEU silicide programs at Babcock and Wilcox, 15:21749 (RA;US)
Nucleonic calculations for possible irradiation experiments in SAPHIR, 15:21721 (R;CH)

SASKATCHEWAN
Lloydminister upgrader, 15:21415 (R;CA)
Lloydminster bi-provincial upgrader: Background papers, 15:21416 (R;CA)
Saskatchewan heavy oil deposit environmental constraints study, 15:21438 (RA;US)
Saskoil annual report 1986, 15:21326 (R;CA)
Water supply constraints to energy development, phase 7: Summary report, 15:22589 (R;CA)
SATELLITES
Exploratory development of the reconnection launcher, 1986–1990, 15:22038 (R;US)
System control and receiving station quarterly report, July–September 1989, 15:22791 (R;US)
SATURN PLANET
Magnetospheric plasma physics, 15:22841 (R;GB)
SAVANNAH RIVER PLANT
Chemometrics/on-line measurements, 15:21739 (J;US)
Data banks for risk assessment at the Savannah River Site, 15:21547 (R;US)
Transaction processing in a quality control laboratory, 15:21444 (R;US)
SAVANNAH RIVER PLANT C REACTOR

SCALE MODELS
Posttest analysis of a 1:6-scale reinforced concrete reactor containment building, 15:21848 (R;US)
SCANDIUM OXIDES
Thermodynamic properties of some metal oxide-zirconia systems, 15:22152 (R;US)
SCATTERING
See also QUASI-ELASTIC SCATTERING
Collision effects on the nuclear dynamics, 15:22935 (R;FR;In French)
SCENEDESMUS
^{60}Co accumulation by scenedesnus obliquus. Mechanism of uptake and relative contribution of radionuclide adsorption and absorption, 15:22746 (R;FR;In French)
SCOTLAND
See UNITED KINGDOM
SCRAP METALS
Health assessment for Curcio Scrap Metal Yard, Saddle Brook Township, Bergen County, New Jersey, Region 2. CERCLIS No. NJD011717584. Preliminary report, 15:22628 (R;US)
SCRUBBERS
Partitioning of metals in rotary-kiln incineration, 15:22052 (R;US)
SCRUBBING
Properties of waste by-products from limestone (lime) dual alkali and limestone (lime) wet scrubbing processes: A literature study, 15:21663 (R;CA)
SEALS
Moisture control in sealed electronic packages, 15:22261 (R;US)
SEASONAL VARIATIONS
Particulate matter dynamics and phytoplankton seasonality in a reservoir embayment ecosystem, 15:22608 (R;US)
SEAWATER
Cycling of the main natural alpha emitters in the coastal marine environment: Final report for the period 1 March 1986 - 30 June 1989, 15:22602 (R;XA)
Japan's Sunshine Project. 1988 Annual summary of comprehensive research, 15:21909 (R;JP;In Japanese)
Japan's Sunshine Project. 1988 Annual summary of comprehensive research, 15:21910 (R;JP)
Spray ice formation, characteristics and adhesion to ship and structure coatings, 15:22310 (RA;CA)
SEBACEOUS GLANDS
See SKIN
SECONDARY BATTERIES
See ELECTRIC BATTERIES
SECONDARY EMISSION
Stimulated desorption induced by hydrogen aggregates (E $\leq$120 keV/u) and by heavy ions (E $\leq$ 400 keV/u). Analytical applications, 15:22966 (R;FR;In French)
SECONDARY RECOVERY
See ENHANCED RECOVERY
SECURITY
A view for security: Thermal imagers, 15:22275 (R;US)
Analysis of software for security-critical systems, 15:23200 (R;US)
SEDIMENT BASINS
See SETTLING PONDS
SEDIMENT-WATER INTERFACES
Contaminant loading to Puget Sound from two marinas. Puget Sound estuary program. Final report, June 1988-October 1988, 15:22613 (R;US)
SEDIMENTARY BASINS
FORTRAN programs for basin analysis and petroleum generation modeling, 15:21206 (R;US)
SEDIMENTARY ROCKS
See also SANDSTONES
SHALES
Direct dating of Phanerozoic sediments by the ^{238}U-^{206}Pb method, 15:22216 (J;GB)
Elastic and viscoelastic calculations of stresses in sedimentary basins, 15:21207 (J;US)
SEDIMENTS
Anaerobic dechlorination of 2,4-dichlorophenol in freshwater sediments in the presence of sulfate, 15:22616 (R;US)
Analysis of proposed post-closure alternatives for the Bear Creek Burial Grounds, 15:21515 (R;US)
Contaminant loading to Puget Sound from two marinas. Puget Sound estuary program. Final report, June 1988-October 1988, 15:22613 (R;US)
The geochemistry of fallout plutonium in the North Atlantic: I. A pore water study in shelf, slope and deep-sea sediments, 15:22709 (J;US)
SEISMIC ARRAYS
See also SEISMIC DETECTORS
Regional Seismic Test Network (RSTN) operations final report, 15:22790 (R;US)
SEISMIC DETECTORS
The long-term measurement of strong-motion earthquakes offshore southern California, 15:21205 (R;US)
SEISMIC EFFECTS
Seismic characterization of fracture properties, 15:21502 (R;US)
System control and receiving station quarterly report, July–September 1989, 15:22791 (R;US)
The role of parameter uncertainty in seismic risk assessment, 15:21824 (RA;US)
SEISMIC EVENTS
See also EARTHQUAKES
Regional Seismic Test Network (RSTN) operations final report, 15:22790 (R;US)
Seismic data processing using digital signal analysis techniques, 15:22480 (R;US)
The long-term measurement of strong-motion earthquakes offshore southern California, 15:21205 (R;US)
SEISMIC NOISE
Microseismic monitoring, 15:21640 (RA;US)
SEISMIC SURVEYS
Application of high resolution reflection seismic to surface mineable oil sands, 15:21384 (RA;CA)
SELENIDES
See also COPPER SELENIDES
INDIUM SELENIDES
Health, safety and environmental issues relating to cadmium usage in photovoltaic energy systems, 15:21627 (R;US)
SELENIUM
Bare soil evaporation at Kesterson Reservoir, Merced County, California: Estimation by physical and chemical methods, 15:22603 (R;US)

Determination of the toxicity, water-quality interactions, and biomagnification of selenium in aquatic food chains. Technical report for 15 August 1987-14 August 1989 (Final), 15:22615 (R;US)

SEMICONDUCTOR DEVICES
See also SEMICONDUCTOR LASERS
SEMICONDUCTOR SWITCHES
CCST [Center for Compound Semiconductor Technology] Research Briefs: Volume 1, Number 1, 15:22184 (R;US)

SEMICONDUCTOR LASERS
Apparatus for the efficient wavelength conversion of laser radiation, 15:22356 (P;US)
Validation of model of external-cavity semiconductor laser and extrapolation from five-element to multielement fiber-coupled high-power laser, 15:22316 (R;US)

SEMICONDUCTOR MATERIALS
Deep level transient spectroscopy in resistive layers, 15:22191 (R;US)
Dependence of the breakdown strength on the lamella orientation at the semiconducting interface in improved XLPE power cables, 15:21863 (R;JP;In Japanese)
Improvement of the insulation near the interface to semiconducting layer on EHV XLPE cables by an additive, 15:21862 (R;JP;In Japanese)

SEMICONDUCTOR SWITCHES
Recent developments in opening photoconductive semiconductor switches, 15:22351 (BA;US)
Toward pulsed power uses for photoconductive semiconductor switches: Closing switches, 15:22346 (BA;US)

SENIOR CENTERS
See PUBLIC BUILDINGS

SEPARATION ENERGY

Bare soil evaporation at Kesterson Reservoir, Merced County, California: Estimation by physical and chemical methods, 15:22603 (R;US)
Biodegradation of old town gas site wastes, 15:21595 (R;US)
Environmental monitoring master sampling schedule, January–December 1990, 15:22706 (R;US)
Health assessment for Rowe Industries, Suffolk County, Sag Harbor, New York, Region 2. CERCLIS No. NYD981486954. Preliminary report, 15:22699 (R;US)
Leaching of heavy metals from thermally decontaminated soils, 15:22553 (R;NL)
Low level waste management handbook series: Environmental monitoring for low level waste disposal sites: Appendices: Revision 2, 15:21468 (R;US)
Low level waste management handbook series: Environmental monitoring for low level waste disposal sites: Revision 2: Volume 1, 15:21467 (R;US)
Minutes from Department of Energy Hazardous Waste Remedial Actions Program Technology Demonstration Program FY 1990 waste site review and ranking meeting, 15:21465 (R;US)
Performance test on testing apparatus for radionuclide migration on ground surface, 15:21493 (R;JP;In Japanese)
Radon transport in dry, cracked soil: Two-dimensional, finite element model, 15:22578 (R;US)
Remediation of contaminated soil using heap leach mining technology, 15:21496 (R;US)
Soil-gas investigations at MGP (manufactured gas plant) sites: An evaluation of alternative compounds. Topical report, January 1989-June 1989. Final report, 15:21596 (R;US)
Water Science and Technology Board annual report, 1988, 15:22592 (R;US)

SOL-GEL PROCESS
Sol-gel processes and materials. November 1971-October 1989 (Citations from the US Patent data base). Report for November 1971-October 1989, 15:22206 (R;US)

SOLAR ACTIVITY
See also SOLAR FLARES
SOLAR WIND
An international discussion on research in solar and space physics, 15:22808 (R;US)
Solar-cycle effects on trapped energetic particles. Technical report, 15:22806 (R;US)
The solar activity measurements experiments (SAMEX) for improved scientific understanding of solar activity, 15:22824 (R;US)

SOLAR ARCHITECTURE
Development of a computer model to predict overheating in passive solar houses, 15:21973 (R;CA)

SOLAR BATTERIES
See SOLAR CELL ARRAYS

SOLAR CELL ARRAYS
Results of the 1989 NASA/JPL balloon flight solar cell calibration program, 15:21618 (R;US)

SOLAR CELLS
See also ALUMINIUM ARSENIDE SOLAR CELLS
CONCENTRATOR SOLAR CELLS
INDIUM PHOSPHIDE SOLAR CELLS
SILICON SOLAR CELLS
Japan's Sunshine Project. 1988 Annual summary of solar energy R and D program, 15:21613 (R;JP)
Japan's Sunshine Project. 1988 Annual summary of solar energy R and D program, 15:21612 (R;JP;In Japanese)
Japan's Sunshine Project. 1988 Annual summary of solar energy R and D program, 15:21613 (R;JP)
Results of the 1989 NASA/JPL balloon flight solar cell calibration program, 15:21618 (R;US)
The photovoltaic properties of an Al In As/InP heterojunctions grown by LPE method. Final technical report, 15:21617 (R;US)

SOLAR COOLING SYSTEMS
Developing, testing, evaluating and optimizing solar heating and cooling systems: Project status report, January 1, 1990–February 28, 1990, 15:21626 (R;US)
Solar buildings program summary, fiscal year 1989: Volume 1, Overview, 15:21625 (R;US)

SOLAR CORONA
MHD (magnetohydrodynamic) slow shocks in coronal and interplanetary space. Final report, 1 June 1986-31 May 1989, 15:22804 (R;US)
Resistive and eruptive instability by ponderomotive force with high-frequency plasma oscillations, 15:23064 (R;US)
Shear-induced inflation of coronal magnetic fields, 15:22821 (R;US)

SOLAR CYCLE
Solar-cycle effects on trapped energetic particles. Technical report, 15:22806 (R;US)

SOLAR ENERGY
Japan's Sunshine Project. 1988 Annual summary of solar energy R and D program, 15:21613 (R;JP)
Japan's Sunshine Project. 1988 Annual summary of solar energy R and D program, 15:21612 (R;JP;In Japanese)
Solar thermal program summary, fiscal year 1989: Volume 1, Overview, 15:21610 (R;US)

SOLAR ENERGY CONVERSION
Indium-tin oxide films. January 1976-January 1990 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for January 1976-January 1990, 15:22328 (R;US)

SOLAR FLARES
Flare dynamics, 15:22829 (RA;GB)
Flare energy release and deposition, 15:22830 (RA;GB)
Large scale magnetic field phenomena, 15:22828 (RA;GB)
Proceedings of the second workshop on thermal-non-thermal interactions in solar flares [TNT-II]: Held at Somerville College, University of Oxford, England on April 10 - 14, 1989 and

arranged by Rutherford Appleton Laboratory, Chilton, Didcot, Oxon., England, 15:22827 (R;GB)
The global energy balance in flares, 15:22831 (RA;GB)

SOLAR HEATING SYSTEMS
Developing, testing, evaluating and optimizing solar heating and cooling systems: Project status report, January 1, 1990–February 28, 1990, 15:21626 (R;US)
Solar buildings program summary, fiscal year 1989: Volume 1, Overview, 15:21625 (R;US)

SOLAR POWER PLANTS
See also OCEAN THERMAL POWER PLANTS
SOLAR THERMAL POWER PLANTS
Spectral solar radiation data base documentation: Volume 1, 15:21611 (R;US)

SOLAR RADIATION
Spectral solar radiation data base documentation: Volume 1, 15:21611 (R;US)

SOLAR SEA POWER PLANTS
See OCEAN THERMAL POWER PLANTS

SOLAR SIMULATORS
Study of harmonic reduction alternatives for the NSTF [National Solar Test Facility] solar simulation: Final report, 15:21609 (R;CA)

SOLAR SYSTEM
Abstracts for the 52nd Annual Meeting of the Meteoritical Society, 15:22822 (R;US)
Allende meteorite: Cosmic rosetta stone. September 1972-November 1989 (Citations from the International Aerospace Abstracts data base). Report for September 1972-November 1989, 15:22825 (R;US)

SOLAR THERMAL POWER PLANTS
Conceptual design study of a 5 kilowatt solar dynamic Brayton power system using a dome Fresnel lens solar concentrator. Final report, 15:21624 (R;US)

SOLAR WIND
MHD (magnetohydrodynamic) slow shocks in coronal and interplanetary space. Final report, 1 June 1986-31 May 1989, 15:22804 (R;US)

SOLDERED JOINTS
The metallurgical mechanisms of solder fatigue, 15:22120 (R;US)

SOLID ELECTROLYTES
Development of planar-geometry solid oxide fuel-cell technology: Phase 2. Annual report, October 1987-October 1988, 15:21958 (R;US)

SOLID LUBRICANTS
Interfacial chemical reactions between MoS2 lubricants and bearing materials, 15:22065 (BA;US)

SOLID SCINTILLATION DETECTORS
Response of BaF_2 detectors to photons of 3-50 MeV energy, 15:22432 (R;DE)

SOLID STATE LASERS
See also NEODYMIUM LASERS
SEMICONDUCTOR LASERS
Gas cooled slab scaling laws and representative designs, 15:22338 (BA;US)
High power and solid state lasers II, 15:22336 (B;US)
Nonlinear optics technology. Phase 2. Area 1. Four-wave-mixing technology. Area 2. Phase conjugated solid state laser technology. Final report, September 1986-January 1988, 15:22315 (R;US)

SOLID WASTES
See also MINERAL WASTES
WOOD WASTES
Analysis of proposed post-closure alternatives for the Bear Creek Burial Grounds, 15:21515 (R;US)
Cyanide in MGP (manufactured gas plant) wastes: Investigation of analytical methods. Topical report, January 1988-June 1989, 15:21577 (R;US)
Partitioning of metals in rotary-kiln incineration, 15:22052 (R;US)
Production of gas fuel and chemicals by the gasification of waste solid and coal. Report for August 1986-July 1987, 15:21139 (R;TW)
Solid-waste incinerators. September 1970-October 1989 (Citations from the US Patent data base). Report for September 1970-October 1989, 15:22054 (R;US)

SOLIDS
Generation and application of ultrafast x-ray sources, 15:23100 (J;US)
[The glow discharge as an atomization and ionization source]: Technical progress report, 15:22457 (R;US)

SOLIDS FLOW
Advanced instrumentation for local measurement of gas-solid suspension flows: Quarterly technical progress report No. 11, 15:21164 (R;US)

SOLVENTS
Enzymology of acetone-butanol-isopropanol formation: Progress report, February 1, 1989–January 31, 1990, 15:22712 (R;US)

SOOT
Kinetics and mechanism of soot formation in hydrocarbon combustion. Final Technical report, 25 October 1985-28 February 1989, 15:22244 (R;US)

SOUND
See SOUND WAVES

SOUND WAVES
Categorizing sound for the establishment of source characteristics, 15:23254 (R;US)

SOUTH DAKOTA
Geothermal monies from Petroleum Violation Escrow Funds, 15:21637 (J;US)

SOUTH KOREA
See REPUBLIC OF KOREA

SOVIET UNION
See USSR

SPACE
See also INTERPLANETARY SPACE
Absorbing boundaries for space plasma simulations, 15:23166 (BA;US)

SPACE POWER REACTORS
SP-100 power system conceptual design for lunar base applications, 15:21712 (R;US)

SPACE VEHICLES
Atomic hydrogen as a launch vehicle propellant, 15:21574 (R;US)
Capillary flow properties of mesh wicks. Interim report, July 1987-August 1988, 15:22270 (R;US)
Design manual for microgravity two-phase flow and heat transfer. Final report, September 1988-June 1989, 15:22271 (R;US)
The US space station and its electric power system, 15:21857 (R;US)
WARP-10: A numerical simulation model for the cylindrical reconnection launcher, 15:22330 (R;US)

SPACECRAFT POWER SUPPLIES
The US space station and its electric power system, 15:21857 (R;US)

SPATIAL DISTRIBUTION
Generation and mobility of radon in soil: Annual technical progress report, March 1987–February 1990, 15:21540 (R;US)
Intermediate-field transport of contaminants: Multiple areal sources in fractured rock and point sources in porous rock, 15:21497 (R;US)

SPENT FUEL CASKS
Design of a high-level waste repository system for the United States, 15:21505 (R;US)
SCANS (Shipping Cask ANalysis System): A microcomputer based analysis system for shipping cask design review: Volume 6, Theory manual: Buckling of circular cylindrical shells, 15:21458 (R;US)

SPENT FUEL ELEMENTS
An assessment of high-level radioactive waste disposal for advanced reactor fuel cycles, 15:21469 (R;US)

SPENT FUELS
Design of a high-level waste repository system for the United States, 15:21505 (R;US)
Examination advice of the location-independent environmental-impact report and advice-direction guides for the location-dependent environmental-impact report concerning

storage and processing of radiactive waste, 15:21529 (R;NL;In Dutch)
The transportation operations system: A description, 15:21456 (R;US)

SPILLWAY
Design of low-cost flowthrough rockfill dams and spillways, 15:21600 (R;CA)

SPRAY PONDS
See SPRAYS

SPRAYS
Spray ice formation, characteristics and adhesion to ship and structure coatings, 15:22310 (RA;CA)

SPUTTERING
A unified integrated model for sputter coating uniformity, 15:22968 (R;US)

STAINLESS STEEL-18-4-1
See STAINLESS STEELS

STAINLESS STEEL-19-9DL
See STAINLESS STEELS

STAINLESS STEEL-310
Corrosion assessment in FBC [fluidized-bed combustion] systems, 15:21165 (R;US)

STAINLESS STEEL-316
Environmentally assisted cracking in light water reactors, 15:21830 (RA;US)

STAINLESS STEEL-Z2CND17-12
See STEEL-CR17NI12MO3-L

STAINLESS STEEL-Z3CND17-12
See STEEL-CR17NI12MO3-L

STAINLESS STEEL-Z6CND17-12
See STEEL-CR17NI12MO3

STAINLESS STEELS
See also CHROMIUM STEELS
Advances and future directions in superplastic materials, 15:22099 (RA;FR)
Creep rupture properties of oxidised 20%Cr austenitic stainless steels, 15:22102 (R;GB)
Initial assessment of the processes and significance of thermal aging in cast stainless steels, 15:21835 (RA;US)
Long-term aging embrittlement of cast duplex stainless steels in LWR systems, 15:21694 (RA;US)
Shippingport aging studies - results and plans, 15:21836 (RA;US)
The role of specimen temperature difference in the elevated temperature pitting/transfer of PE16 and 20/25/Nb SS during impact wear, 15:22101 (R;GB)
Weldability and microstructural analysis of nuclear-grade austenitic stainless steels, 15:22133 (D;US)

STANDING CROP
See BIOMASS

STANFORD LINEAR COLLIDER
A plasma lens for linear collider final focus, 15:23164 (BA;US)
Improving reliability in the SLC [Stanford Linear Collider] control system, 15:22398 (R;US)

STAR CLUSTERS
Further observations of rotationally excited far infrared OH16 and OH18 emission in Orion-KL: Tighter constraints on the nature of the emitting region, 15:22815 (R;DE)

STAR EVOLUTION
Archival research on absorption lines in violently star-forming galaxies, 15:22817 (R;US)

STATE BUILDINGS
See PUBLIC BUILDINGS

STATES (ENERGY)
See ENERGY LEVELS

STEAM GENERATORS
Environmentally assisted cracking in light water reactors, 15:21830 (RA;US)
Production of heavy crude oil using downhole steam generators, 15:21230 (RA;US)
STARRS-MMS [Secondary side Transport And Retention of Radioactive Species-modular modeling system] code: Evaluating steam generator tube ruptures: Volume 3, Users manual, Final report, 15:21742 (R;US)
STARRS-MMS [Secondary-Side Transport And Retention of Radioactive Species-Modular Modeling System] code: Evaluating steam generator tube ruptures: Volume 2: Programmer's manual, Final report, 15:21741 (R;US)
STARRS-MMS [Secondary-Side Transport And Retention of Radioactive Species-Modular Modeling System] code: Evaluating steam generator tube ruptures: Volume 4: Application, Final report, 15:21798 (R;US)
Wet oxidation downhole steam generator for recovery of deep heavy oil, 15:21229 (RA;US)

STEAM INJECTION
Blocking of high permeability zones in steam flooding by emulsions, 15:21246 (RA;US)
Effect of core preparation on laboratory steamflood results, 15:21215 (RA;US)
Evaluation of additives to enhance the in situ steam processes applied to US and Canadian tar sand and heavy oil reservoirs, 15:21411 (RA;US)
Field observations of steam distribution during injection to the Cold Lake Reservoir, 15:21420 (RA;CA)
Oilfield steam distribution, investigation of steam/water two-phase flow problems, 15:21245 (RA;US)
Steam quality measurements by neutron transmission, 15:21219 (RA;US)
Thermal recovery of light crude oils using steam - A laboratory study using a two-dimensional physical model, 15:21284 (RA;US)
Water treatment and steam generation system for enhanced oil recovery using production water, 15:21228 (RA;US)

SUPERCOMPUTERS
A parallel particle-in-cell model for the massively parallel processor, 15:23238 (BA;US)
Computational fluid dynamics: Complex flows requiring supercomputers. January 1975-December 1989 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for January 1975-December 1989, 15:22874 (R;US)
High-performance computing and networking for science. Background paper, 15:23222 (R;US)
Supercomputers need super arithmetic. Final report, 15:23221 (R;US)
Supercomputers. December 1985-January 1988 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for December 1985-January 1988, 15:23223 (R;US)
Supercomputers. February 1988-December 1989 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for February 1988-December 1989, 15:23224 (R;US)
The Livermore Distributed Storage System: Requirements and overview, 15:23234 (R;US)
SUPERCONDUCTING COILS
WARP-10: A numerical simulation model for the cylindrical reconnection launcher, 15:22330 (R;US)
SUPERCONDUCTING DEVICES
See also SUPERCONDUCTING MAGNETS
High-quality tunnel-junction devices using high-T(c) superconductors, 15:22355 (P;US)
SUPERCONDUCTING FILMS
High-quality tunnel-junction devices using high-T(c) superconductors, 15:22355 (P;US)
$Y_1Ba_2Cu_3O_{7-x}$ laser-ablation plume dynamics measurement by nanosecond response ion probe: Comparison with optical measurements, 15:22453 (R;US)
SUPERCONDUCTING MAGNETS
Heat leak measurements in superconducting dipole magnet supports, 15:22389 (R;SU;In Russian)

Influence of interlayers seams on the superconducting winding temperature regime, 15:22386 (R;SU;In Russian)
Large high-field spaceborne experimental magnet systems: Design considerations, 15:23175 (BA;US)

SUPERCONDUCTING WIRES
Development of the methods and means of precise forming and geometry control of superconducting current-carrying element for the UNR pulsed dipoles, 15:22388 (R;SU;In Russian)

SUPERCONDUCTIVITY
Stabilization of high $T_c$superconductivity in cadmium sulfide: Progress report, February 1989–February 1990, 15:22172 (R;US)

SUPERCONDUCTORS
Band electronic structures and crystal packing forces: Progress report, January 1989–February 1990, 15:22171 (R;US)
Electronically induced phase transformations. Final report, 1 October 1975-30 September 1980, 15:22971 (R;US)
Fabrication of superconducting cable by explosive compaction, 15:22157 (R;US)
High temperature chemistry of oxide superconductors, 15:22127 (R;US)
Neutrons: The kinder, gentler probe of condensed matter, 15:22945 (R;US)
Polarized x-ray absorption studies of oxide superconductors, 15:22974 (BA;US)
Systematics in positron annihilation lifetime analysis of high $T_c$superconducting transitions, 15:22333 (R;US)
The electronic properties of high $T_c$superconductors probed by positron annihilation, 15:22973 (R;US)
Toughened $YBa_2Cu_3O_x/ZrO_2$ composites, 15:22139 (R;US)
Vortex lattices in theory and practice, 15:22877 (BA;US)
preparation of 110K (Bi, Pb)-Sr-Ca-Cu-O superconductor from glass precursor, 15:22181 (R;US)

SUPERCRITICAL FLOW
See TURBULENT FLOW

SUPERCRITICAL FLUID CHROMATOGRAPHY
Supercritical fluid chromatography and mass spectrometry development for fossil fuels, 15:22208 (RA;US)

SUPERFUND
Health assessment for Anchor Lith Kemko, Hicksville, New York, Region 2. CERCLIS No. NYD001485226. Preliminary report, 15:22672 (R;US)
Health assessment for Applied Environmental Services, Glenwood Landing, New York, Region 2. CERCLIS No. NYD980535652. Preliminary report, 15:22568 (R;US)
Health assessment for Barceloneta Landfill, Florida Afuefra, Puerto Rico, Region 2. CERCLIS No. PRD98059129. Preliminary report, 15:22688 (R;US)
Health assessment for Batavia Landfill, Genesee County, Batavia, New York, Region 2. CERCLIS No. NYD980507693. Preliminary report, 15:22670 (R;US)
Health assessment for Beachwood Borough and Berkeley Township National Priorities List (NPL) Site, Ocean County, New Jersey, Region 2. CERCLIS No. NJD980654123. Final report, 15:22618 (R;US)
Health assessment for Bog Creek Farm Site (BCFS) National Priorities List (NPL) site, Howell Township, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD063157150. Final report, 15:22619 (R;US)
Health assessment for Burnt Fly Bog National Priorities List Site, Marlboro, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD980504997. Final report, 15:22620 (R;US)
Health assessment for Byron Barrel, Genesee County, Byron, New York, Region 2. CERCLIS No. NYD980780670. Preliminary report, 15:22671 (R;US)
Health assessment for CPS/Madison Industries, Old Bridge Township, Middlesex County, New Jersey, Region 2. CERCLIS No. NJD002141190. Preliminary report, 15:22627 (R;US)
Health assessment for Caldwell Trucking Company, Fairfield, New Jersey, Region 2. CERCLIS No. NJD048798953. Preliminary report, 15:22554 (R;US)
Health assessment for Chemical Control Corporation, Elizabeth, New Jersey, Region 2. CERCLIS No. NJD000607481. Final report, 15:22621 (R;US)
Health assessment for Chemical Leaman Tank Lines, Inc. (CLTL) NPL (National Oriorities List) site, Logan Township, Gloucester County, New Jersey, Region 2. CERCLIS No. NJD047321443. Final report, 15:22622 (R;US)
Health assessment for Chemsol Inc., Piscataway, Middlesex County, New Jersey, Region 2. CERCLIS No. NJD980528889. Preliminary report, 15:22623 (R;US)
Health assessment for Ciba-Geigy National Priorities List (NPL) site, Dover Township, Ocean County, New Jersey, Region 2. CERCLIS No. NJD00150217. Final report, 15:22624 (R;US)
Health assessment for Claremont Poly Chemical Corp., Nassau County, Old Bethpage, New York, Region 2. CERCLIS No. NYD002044584. Preliminary report, 15:22673 (R;US)
Health assessment for Colesville Landfill, Broome County, Colesville, New York, Region 2. CERCLIS No. NYD980768691. Preliminary report, 15:22674 (R;US)
Health assessment for Cortese Landfill, Sullivan County, Tusten, New York, Region 2. CERCLIS No. NYD980528475. Preliminary report, 15:22569 (R;US)
Health assessment for Cosden Chemical Coatings NPL (National Priorities List) site, Beverly, New Jersey, Region 2. CERCLIS No. NJD000565531. Preliminary report, 15:22555 (R;US)
Health assessment for Curcio Scrap Metal Yard, Saddle Brook Township, Bergen County, New Jersey, Region 2. CERCLIS No. NJD011717584. Preliminary report, 15:22628 (R;US)
Health assessment for D'Imperio Property Site, Hamilton Township, New Jersey, Region 2. CERCLIS No. NJD980529416. Final report, 15:22629 (R;US)
Health assessment for Derewal Chemical Company National Priorities List (NPL) site, Kingwood Township, Hunterdon County, New Jersey, Region 2. CERCLIS No. NJD980761373. Preliminary report, 15:22630 (R;US)
Health assessment for Diamond Alkali/80 Lister Avenue, Newark, New Jersey, Region 2. CERCLIS No. NJD980528996. Final report, 15:22631 (R;US)
Health assessment for Evor Phillips Leasing, Old Bridge Township, Middlesex County, New Jersey, Region 2. CERCLIS No. NJD980654222. Preliminary report, 15:22632 (R;US)
Health assessment for F.M.C. Corporation, Orleans County, Shelby, New York, Region 2. CERCLIS No. NYD000511857. Preliminary report, 15:22570 (R;US)
Health assessment for Facet Enterprises, Inc., Chemung County, Elmira Heights, New York, Region 2. CERCLIS No. NYD073675514. Preliminary report, 15:22676 (R;US)
Health assessment for Fairlawn Wellfield, Fairlawn, New Jersey, Region 2. CERCLIS No. NJD980654107. Preliminary report, 15:22633 (R;US)
Health assessment for Fibers Public Supply Wells, Guayama, Puerto Rico, Region 2. CERCLIS No. PRD980763783. Preliminary report, 15:22574 (R;US)
Health assessment for Fort Dix Sanitary Landfill, Pemberton Township, New Jersey, Region 2. CERCLIS No. NJ2210020275. Preliminary report, 15:22634 (R;US)
Health assessment for Fulton Terminals Site, Fulton, New York, Region 2. CERCLIS No. NYD980593099. Final report, 15:22669 (R;US)
Health assessment for General Electric Wiring Devices, Juana Diaz, Puerto Rico, Region 2. CERCLIS No. PRD090282757. Final report, 15:22573 (R;US)
Health assessment for General Motors Central Foundry, St. Lawrence County, Massena, New York, Region 2. CERCLIS No. NYD091972554. Preliminary report, 15:22667 (R;US)
Health assessment for Genzale Plating, Franklin Square, New York, Region 2. CERCLIS No. NYD002050110. Preliminary report, 15:22666 (R;US)
Health assessment for Goldisc Recording, Holbrook, New York, Region 2. CERCLIS No. NYD980768717. Preliminary report, 15:22665 (R;US)
Health assessment for Goose Farm National Priorities List (NPL) site, Plumsted Township, Ocean County, New Jersey, Region 2. CERCLIS No. NJD980530109. Final report, 15:22635 (R;US)

Health assessment for Griffiss Air Force Base NPL (National Priorities List) site, Rome, Oneida County, New York, Region 2. CERCLIS No. NY4571924451. Final report, 15:22664 (R;US)

Health assessment for Haviland Complex National Priorities List (NPL) site, Hyde Park, New York, Region 2. CERCLIS No. NYD980785661. Final report, 15:22663 (R;US)

Health assessment for Hercules Inc., Gibbstown, Glocester County, New Jersey, Region 2. CERCLIS No. NJD002349058. Preliminary report, 15:22636 (R;US)

Health assessment for Hertel Landfill Inc., Ulster County, Plattekill, New York, Region 2. CERCLIS No. NYD980780779. Preliminary report, 15:22662 (R;US)

Health assessment for Hooker Chemical (102nd Street Landfill), Niagara Falls, New York, Region 2. CERCLIS No. NYD980506810. Preliminary report, 15:22661 (R;US)

Health assessment for Hooker/Ruco, Hicksville, New York, Region 2. CERCLIS No. NYD002920312. Preliminary report, 15:22566 (R;US)

Health assessment for Horstmann's Dump, East Hanover, New Jersey, Region 2. CERCLIS No. NJD981084577. Preliminary report, 15:22556 (R;US)

Health assessment for Hudson River PCB (polychlorinated biphenyl) NPL (National Priorities List) site, State of New York, Region 2. CERCLIS No. NYD980763841. Final report, 15:22659 (R;US)

Health assessment for Islip Sanitary Landfill, Suffolk County, New York, Region 2. CERCLIS No. NYD980506901. Preliminary report, 15:22658 (R;US)

Health assessment for Johnstown City Landfill, Fulton County, Johnstown, New York, Region 2. CERCLIS No. NYD980506927. Preliminary report, 15:22677 (R;US)

Health assessment for Jones Sanitation Landfill (Jones Septic Site), Hyde Park, Dutchess County, New York, Region 2. CERCLIS No. NYD980534556. Preliminary report, 15:22572 (R;US)

Health assessment for Kentucky Avenue Wellfield National Priorities List (NPL) site, Horseheads, Chemung County, New York, Region 2. CERCLIS No. NYD981560428. Final report, 15:22678 (R;US)

Health assessment for Kin-Buc Landfill, Edison Township, New Jersey, Region 2. CERCLIS No. NJD049860836. Final report, 15:22637 (R;US)

Health assessment for Lang Property National Priorities List (NPL) site, Pemberton Township, Burlington County, New Jersey, Region 2. CERCLIS No. NJD980505382. Final report, 15:22638 (R;US)

Health assessment for Liberty Industrial Finishing, Nassau County, Farmingdale, New York, Region 2. CERCLIS No. NYD000337295. Preliminary report, 15:22679 (R;US)

Health assessment for Lone Pine Landfill National Priorities List (NPL) site, Freehold, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD980505424. Final report, 15:22639 (R;US)

Health assessment for Ludlow Landfill National Priorities List (NPL) site, Clayville, Oneida County, New York, Region 2. CERCLIS No. NYD013468939. Final report, 15:22680 (R;US)

Health assessment for Malta Rocket Test Site, Saratoga County, Malta, New York, Region 2. CERCLIS No. NYD980535124. Preliminary report, 15:22681 (R;US)

Health assessment for Mannheim Avenue Dump, Galloway Township, New Jersey, Region 2. CERCLIS No. NJD980654180. Preliminary report, 15:22641 (R;US)

Health assessment for Marathon Battery, Cold Springs, New York, Region 2. CERCLIS No. NYD001959757. Preliminary report, 15:22571 (R;US)

Health assessment for Matlack, Incorporated, Swedesboro, Gloucester County, New Jersey, Region 2. CERCLIS No. NJD043584101. Preliminary report, 15:22640 (R;US)

Health assessment for Monroe Township Landfill, Monroe, New Jersey, Region 2. CERCLIS No. NJD980505671. Preliminary report, 15:22642 (R;US)

Health assessment for Montgomery Township Housing Development, Montgomery, New Jersey, Region 2. CERCLIS No. NJD980654164. Final report, 15:22643 (R;US)

Health assessment for Myers Property, Franklin Township, New Jersey, Region 2. CERCLIS No. NJD980654198. Preliminary report, 15:22557 (R;US)

Health assessment for N.L. Industries, Inc., Pedricktown, New Jersey, Region 2. CERCLIS No. NJD061843249. Preliminary report, 15:22647 (R;US)

Health assessment for Naval Air Engineering Center, Lakehurst, Ocean County, New Jersey, Region 2. CERCLIS No. NJ7170023744. Preliminary report, 15:22645 (R;US)

Health assessment for Naval Weapons Station-Site A, Colts Neck, New Jersey, Region 2. CERCLIS No. NJ0170022172. Preliminary report, 15:22646 (R;US)

Health assessment for Nepera Chemical Co., Orange County, Maybrook, New York, Region 2. CERCLIS No. NYD000511451. Preliminary report, 15:22682 (R;US)

Health assessment for Niagara County Refuse Disposal, Niagara County, New York, Region 2. CERCLIS No. NYD000514257. Preliminary report, 15:22683 (R;US)

Health assessment for North Sea Landfill, Suffolk County, North Sea, New York, Region 2. CERCLIS No. NYD980762520. Preliminary report, 15:22684 (R;US)

Health assessment for PJP Landfill, Judson County, Jersey City, New Jersey, Region 2. CERCLIS No. NJD980505648. Preliminary report, 15:22648 (R;US)

Health assessment for Pasley Solvents and Chemical, Garden City, New York, Region 2. CERCLIS No. NYD991292004. Preliminary report, 15:22575 (R;US)

Health assessment for Pijak Farm, Plumsted Township, New Jersey, Region 2. CERCLIS No. NJD980532808. Final report, 15:22558 (R;US)

Health assessment for Port Washington Landfill, North Hempstead, New York, Region 2. CERCLIS No. NYD980654206. Preliminary report, 15:22703 (R;US)

Health assessment for RCA del Caribe, Inc., Barceloneta, Puerto Rico, Region 2. CERCLIS No. PRD090370537. Preliminary report, 15:22687 (R;US)

Health assessment for Ramapo Town Landfill, Rockland County, Ramapo, New York, Region 2. CERCLIS No. NYD000511493. Preliminary report, 15:22702 (R;US)

Health assessment for Reich Farm National Priorities List (NPL) site, Pleasant Plains, Ocean County, New Jersey, Region 2. CERCLIS No. NJD980529713. Final report, 15:22559 (R;US)

Health assessment for Renora Site, Edison Township (bonhantown), New Jersey, Region 2. CERCLIS No. NJD070415005. Final report, 15:22649 (R;US)

Health assessment for Ringwood Mines/Landfill National Priorities List (NPL) site, Ringwood, Passaic County, New Jersey, Region 2. CERCLIS No. NJD980529739. Final report, 15:22650 (R;US)

Health assessment for Robintech Site, Broome County, Vestal, New York, Region 2. CERCLIS No. NYD002232957. Preliminary report, 15:22700 (R;US)

Health assessment for Rockaway Borough Well Field National Priorities List (NPL) site, Borough of Rockaway, Morris County, New Jersey, Region 2. CERCLIS No. NJD980654115. Final report, 15:22651 (R;US)

Health assessment for Rocky Hill Municipal Wellfield, Rocky Hill, New Jersey, Region 2. CERCLIS No. NJD980654156. Final report, 15:22652 (R;US)

Health assessment for Rowe Industries, Suffolk County, Sag Harbor, New York, Region 2. CERCLIS No. NYD981486954. Preliminary report, 15:22699 (R;US)

Health assessment for S-Area Landfill/Hooker, Niagara Falls, New York, Region 2. CERCLIS No. NYD000000001. Preliminary report, 15:22567 (R;US)

Health assessment for SMS Instruments, Inc., Deer Park, New York, Region 2. CERCLIS No. NYD001533165. Preliminary report, 15:22696 (R;US)

Health assessment for Sarney Property, Amenia, New York, Region 2. CERCLIS No. NYD980535165. Preliminary report, 15:22698 (R;US)

Health assessment for Sayreville Landfill, Middlesex County, Sayreville, New Jersey, Region 2. CERCLIS No. NJD980505754. Preliminary report, 15:22653 (R;US)

Health assessment for Scientific Chemical Processing, Carlstadt, Bergen County, New Jersey, Region 2. CERCLIS No. NJD070565403. Preliminary report, 15:22560 (R;US)
Health assessment for Sharkey Landfill, Troy Hills, New Jersey, Region 2. CERCLIS No. NJD980505762. Final report, 15:22654 (R;US)
Health assessment for Shieldalloy Corporation, Newfield Borough, Gloucester County, New Jersey, Region 2. CERCLIS No. NJD002365930. Preliminary report, 15:22655 (R;US)
Health assessment for Sinclair Refinery, Allegany County, Wellsville, New York, Region 2. CERCLIS No. NYD980535125. Preliminary report, 15:22697 (R;US)
Health assessment for Solvent Savers, Chenango County, Lincklaen, New York, Region 2. CERCLIS No. NYD980421176. Preliminary report, 15:22695 (R;US)
Health assessment for Spence Farm, Ocean County, Plumsted Township, New Jersey, Region 2. CERCLIS No. NJD980532816. Final report, 15:22561 (R;US)
Health assessment for Suffern Well Field NPL (National Priorities List) site, Village of Suffern, Rockland County, New York, Region 2. CERCLIS No. NYD980780878. Final report, 15:22694 (R;US)
Health assessment for Swope Oil Company, Pennsauken, Camden County, New Jersey, Region 2. CERCLIS No. NJD041743220. Final report, 15:22562 (R;US)
Health assessment for Syosset Landfill, Nassau County, Syosset, New York, Region 2. CERCLIS No. NYD000511360. Preliminary report, 15:22693 (R;US)
Health assessment for Tabernacle Drum Dump National Priorities List (NPL) site, Tabernacle Township, Burlington County, New Jersey, Region 2. CERCLIS No. NJD980761357. Final report, 15:22656 (R;US)
Health assessment for US Radium-West Orange, Orange, Essex County, New Jersey, Region 2. CERCLIS No. NJD980654172. Preliminary report, 15:21519 (R;US)
Health assessment for Universal Oil Products National Priorities List (NPL) site, East Rutherford, New Jersey, Region 2. CERCLIS No. NJD002005106. Preliminary report, 15:22563 (R;US)
Health assessment for Ventron/Velsicol, Wood-Ridge Borough, Bergen County, New Jersey, Region 2. CERCLIS No. NJD980529879. Preliminary report, 15:22564 (R;US)
Health assessment for Volney Landfill, Volney, New York, Region 2. CERCLIS No. NYD980509376. Final report, 15:22691 (R;US)
Health assessment for Waldick Aerospace Devices, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD054981337. Final report, 15:22565 (R;US)
Health assessment for Warwick Landfill, Orange County, Warwick, New York, Region 2. CERCLIS No. NYD980506679. Preliminary report, 15:22690 (R;US)
Health assessment for Woodland Route 532 Dump, Woodland Township, Burlington County, New Jersey, Region 2. CERCLIS No. NJD980505887. Preliminary report, 15:22657 (R;US)
Health assessment for Woodlands Route 72 Dump, Woodland Township, Burlington County, New Jersey, Region 2. Cerclis No. NJD980505879. Preliminary report, 15:22617 (R;US)
Health assessment for York Oil Company, Moira, New York, Region 2. CERCLIS No. NYD000511733. Final report, 15:22689 (R;US)
Health assessment for richardson Hill Landfill, Delaware County, Sidney, New York, Region 2. CERCLIS No. NYD980507735. Preliminary report, 15:22701 (R;US)
Health assessment for the Endicott Wellfield Site, Broome County, New York, Region 2. CERCLIS No. NYD980780746. Final report, 15:22675 (R;US)
Manufactured gas plants and the National Priorities List: A technical review. Topical report, August 1988-July 1989. Final report, 15:21597 (R;US)

Remedial Action

Health assessment for Combe Fill North Landfill, Mount Olive Township, New Jersey, Region 2. CERCLIS No. NJD980530596. Final report, 15:22625 (R;US)
Health assessment for Combe Fill South Landfill, Morris County, New Jersey, Region 2. CERCLIS No. NJD094966611. Final report, 15:22626 (R;US)
Health assessment for GEMS Landfill National Priorities List (NPL) site, Gloucester Township, Camden County, New Jersey, Region 2. CERCLIS No. NJD980529192. Final report, 15:21900 (R;US)
Health assessment for Ge-Moreau, South Glen Falls, New York, Region 2. CERCLIS No. NYD980052335. Final report, 15:22668 (R;US)
Health assessment for Hyde Park Landfill National Priorities List (NPL) site, Niagara Falls, New York, Region 2. CERCLIS No. NYD000831644. Final report, 15:22660 (R;US)
Health assessment for Nascolite Corporation, Millville, New Jersey, Region 2. CERCLIS No. NJD002362705. Final report, 15:22644 (R;US)
Health assessment for Olean Well Field National Priorities List (NPL) site, Olean Cattaraugus County, New York, Region 2. CERCLIS No. NYD980528657. Final report, 15:22685 (R;US)
Health assessment for Tronic Plating Co. Inc., Suffolk County, Farmingdale, New York, Region 2. CERCLIS No. NYD002059517. Preliminary report, 15:22692 (R;US)
Health assessment for Vega Alta Public Supply Wells Site, Vega Alta, Puerto Rico, Region 2. CERCLIS No. PRS187147. Final report, 15:22686 (R;US)

TEXAS EXPERIMENTAL TOKAMAK
See TEXT DEVICES

TEXT DEVICES
Impurity behaviour during ECH in the Texas experimental tokamak, 15:23007 (RA;XA)

TEXTILE INDUSTRY
Byssinosis and small airways disease: Terminal progress report, 15:22733 (R;US)

TEXTOR TOKAMAK
Plasma transport in ergodized magnetic fields, 15:23013 (RA;XA)

TFTR DEVICE
See TFTR TOKAMAK

TFTR REACTORS
See TFTR TOKAMAK

TFTR TOKAMAK
Measurements of the charge state distribution and transport of iron impurity ions in TFTR plasmas by a multi-chord X-ray crystal spectrometer, 15:23006 (RA;XA)
RF field measurements in the vicinity of an ICRF antenna, 15:23087 (BA;US)

THALLIUM OXIDES
Structure studies on Tl-Ca-Ba-Cu-O high-Tc superconductors. Effects of cation disorder and oxygen vacancies, 15:22160 (J;NL)

THERAPEUTIC AGENTS
See DRUGS

THERMAL COMFORT
Predictions of thermal comfort and pollutant distribution for a thermostatically-controlled, air-conditioned, partitioned room: Numerical results and enhanced graphical presentation, 15:22012 (RA;CA)

THERMAL CONDUCTIVITY
Area Over Length (AOL): A program for the calculation of effective two-dimensional thermal conductance through an arbitrarily shaped region, 15:22978 (R;US)

THERMAL EFFECTS
See TEMPERATURE EFFECTS

THERMAL EFFLUENTS
Perturbations in atmospheric density caused by high rise buildings and their effects on astronomical observations: A case study, 15:22506 (RA;CA)

THERMAL EQUILIBRIUM
A new model to compute air distribution, 15:22010 (RA;CA)

THERMAL FATIGUE
Thermal fatigue durability for advanced propulsion materials, 15:22123 (R;US)

THERMAL INSULATION
Indium-tin oxide films. January 1976-January 1990 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for January 1976-January 1990, 15:22328 (R;US)

THERMAL POLLUTION (AIR)
See AIR POLLUTION

THERMAL POLLUTION (WATER)
See WATER POLLUTION

THERMAL PROPERTIES
See THERMODYNAMIC PROPERTIES

THERMAL RECOVERY
Heavy oil and the potential of thermal recovery in the United States, 15:21315 (RA;US)
Laboratory simulation of thermal changes in heavy crudes during thermal recovery, 15:21248 (RA;US)

THERMAL SPRINGS
See also HOT SPRINGS
Geochemistry, isotopic composition, and origin of fluids emanating from mud volcanoes in the Copper River basin, Alaska, 15:22798 (J;US)

THERMIONIC DIODES
High current proton beams in multi-stage linear induction accelerators, 15:22373 (BA;US)
Theory of voltage decay in applied-B ion diodes, 15:23075 (BA;US)

THERMODYNAMIC PROPERTIES
See also ENTHALPY
THERMAL CONDUCTIVITY
Calculation of thermodynamic properties for monomeric U(IV) hydrolysis products at 298.15 K and zero ionic strength, 15:21499 (R;US)

THERMOMETERS
See also NOISE THERMOMETERS
A nonintrusive method for measuring the operating temperature of a solenoid-operated valve, 15:22281 (R;US)

THERMONUCLEAR DEVICES
See also ICF DEVICES
PINCH DEVICES
Proceedings of the sixth IEEE pulsed power conference (technical papers), 15:22337 (B;US)

THERMONUCLEAR IGNITION
Application of uncertainty analysis of ignition performance to the Engineering Test Reactor, 15:23149 (R;US)

THERMONUCLEAR REACTIONS
A parallel particle-in-cell model for the massively parallel processor, 15:23238 (BA;US)
A search for neutrons and gamma rays associated with tritium production in deuterated metals, 15:22982 (R:US)
Calorimeter measurements in relativistic heavy-ion research: Progress in research, 15:22915 (R;US)

THERMONUCLEAR REACTOR MATERIALS
An interim report on the materials and selection criteria analysis for the Compact Ignition Tokamak toroidal field coil turn-to-turn insulation system: Volume 2, Photographic summary of laboratory testing: Interim results, 15:23134 (R;US)
Fusion reactor materials semiannual progress report for the period ending September 30, 1989, 15:23108 (R;US)
Implications of neutron spectrum and flux defferences on fission-fusion correlations at high neutron fluence, 15:23140 (R;US)
Irradiation creep and swelling of the fusion heats of PCA, HT9 and 9Cr-1Mo irradiated to high neutron fluence, 15:23143 (R;US)
Neutron-induced changes in density and electrical conductivity of copper alloys at 16 to 98 dpa and 420°C, 15:23141 (R;US)
Tensile behavior and swelling of ternary austenitic alloys irradiated in different neutron spectra, 15:23142 (R;US)
Tritium release from irradiated beryllium at elevated temperatures, 15:23144 (R;US)

THERMONUCLEAR REACTOR WALLS
See also FIRST WALL
Behavior of light impurity in beam heated JT-60 plasmas with graphite walls, 15:23011 (RA;XA)
First wall and divertor plate sputtering in a tokamak reactor, 15:23004 (RA;XA)
Performance of JT-60 first wall, 15:23112 (RA;XA)
Radiation losses and global power balance of JT-60 plasmas, 15:23012 (RA;XA)

THERMONUCLEAR REACTORS

Deterrence of arms control treaty evasion by suspect site inspections, 15:22093 (R;US)

TRIBOLOGY
Fundamentals of tribology at the atomic level, 15:22064 (BA;US)
Measurements of tribological behavior of advanced materials: Summary of US results on VAMAS (Versailles Advanced Materials and Standards) Round-Robin No. 2, 15:22286 (R;US)
New materials approaches to tribology: Theory and applications; Proceedings of the Symposium, Boston, MA, Nov. 29-Dec. 2, 1988, 15:22063 (B;US)
The evaluation of materials for tribological applications, 15:22070 (BA;US)
Tribological applications for advanced ceramics, 15:22068 (BA;US)
Tribology. June 1970-May 1985 (Citations from the NTIS data base). Report for June 1970-May 1985, 15:22288 (R;US)
Tribology. June 1985-December 1989 (Citations from the NTIS data base). Report for June 1985-December 1989, 15:22289 (R;US)

TRIGGER CIRCUITS
The muon trigger of the SAPHIR shower detector, 15:22427 (R;DE;In German)

TRINIDAD AND TOBAGO
A thermal classification model for Trinidad crude oils: A thermal analysis approach, 15:21340 (RA;US)

TRIPLET PARTICLES
See QUARKS

TRITIATED WATER
See TRITIUM OXIDES

TRITIUM
Data compilation to accompany residence times of Minnesota ground waters. Final report, 15:22609 (R;US)
In-vessel maintenance on the IGNITEX experiment, 15:23186 (BA;US)
Low level waste management handbook series: Environmental monitoring for low level waste disposal sites: Revision 2: Volume 1, 15:21467 (R;US)
Low level waste management handbook series: Environmental monitoring for low level waste disposal sites: Appendices: Revision 2, 15:21468 (R;US)
Measurements and material accounting, 15:21569 (J;US)
Plasma diagnosis in the IGNITEX experiment, 15:23094 (BA;US)
Studies on tritiated water recycle process, 15:21454 (R;JP;In Japanese)
Tritium distribution ratios between the 30 % tributyl phosphate(TBP)-normal dodecane(nDD) organic phase and uranyl nitrate-nitric acid aqueous phase, 15:21452 (R;JP)

TRITIUM OXIDES
Tritium distribution ratios between the 30 % tributyl phosphate(TBP)-normal dodecane(nDD) organic phase and uranyl nitrate-nitric acid aqueous phase, 15:21452 (R;JP)

TRITIUM PRODUCTION REACTORS
Assurance for the future, 15:21785 (R;US)

TROUT
Effects of environmental and physiological variables on the uptake of hydrophobic contaminants by the gills of rainbow trout, Salmo gairdneri (Richardson), 15:22598 (R;US)
Protection of wild adult steelhead in Idaho by adipose fin removal: Five year completion report: Final report, 15:21604 (R;US)

TRU WASTES
See ALPHA-BEARING WASTES

TUBES
STARRS-MMS [Secondary side Transport And Retention of Radioactive Species-modular modeling system] code: Evaluating steam generator tube ruptures: Volume 3, Users manual, Final report, 15:21742 (R;US)
STARRS-MMS [Secondary-Side Transport And Retention of Radioactive Species-Modular Modeling System] code: Evaluating steam generator tube ruptures: Volume 4: Application, Final report, 15:21798 (R;US)

STARRS-MMS [Secondary-Side Transport And Retention of Radioactive Species-Modular Modeling System] code: Evaluating steam generator tube ruptures: Volume 2: Programmer's manual, Final report, 15:21741 (R;US)

TUBES (CONDUITS)
See PIPES

TUMORS
See NEOPLASMS

TUNGSTEN
Nuclear production research expands materials knowledge, 15:21729 (J;US)

TUNGSTEN ALLOYS
Experimental evaluation of new alloy coatings. Final report, November 1986-January 1989, 15:22098 (R;US)

TUNNEL EFFECT
High-quality tunnel-junction devices using high-T(c) superconductors, 15:22355 (P;US)

TUNNEL FURNACES
Turbulence measurements in the swirling flow at the entrance to the CCRL [Combustion and Carbonization Research Laboratory] tunnel furance facility, 15:22291 (R;CA)

TUNNEL KILNS
See TUNNEL FURNACES

TUNNELS
Heart-disease mortality among bridge and tunnel officers exposed to carbon monoxide, 15:22517 (R;US)
Tunnel Review Executive Committee report of programs conducted in the Nevada Test Site tunnel complex, 15:22475 (R;US)

TURBINE BLADES
Application of a two-dimensional unsteady viscous analysis code to a supersonic throughflow fan stage, 15:22272 (R;US)

TURBULENT FLOW
Turbulence measurements in the swirling flow at the entrance to the CCRL [Combustion and Carbonization Research Laboratory] tunnel furance facility, 15:22291 (R;CA)

TVO-1 REACTOR
Monitoring of radioactivity in the environs of Finnish nuclear power stations in 1987: Supplement 5 to annual report STUK-A-74, 15:21743 (R;FI)

TVO-2 REACTOR
Monitoring of radioactivity in the environs of Finnish nuclear power stations in 1987: Supplement 5 to annual report STUK-A-74, 15:21743 (R;FI)

TWO-DIMENSIONAL CALCULATIONS
Radon transport in dry, cracked soil: Two-dimensional, finite element model, 15:22578 (R;US)
Two-dimensional fractal geometry, critical phenomena and conformal invariance, 15:22905 (R;FR)

TWO-PHASE FLOW
Lubricated pipelining: Stability of core-annular flow. Part 2, 15:22278 (R;US)

2-DIMENSIONAL CALCULATIONS
See TWO-DIMENSIONAL CALCULATIONS

2-PROPANOL
See PROPANOLS

U

U CODES
URR [Unresolved Resonance Region] computer code: A code to calculate resonance neutron cross-section probability tables, Bondarenko self-shielding factors, and self-indication ratios for fissile and fertile nuclides, 15:22920 (R;US)

U3O8

UHV DC SYSTEMS
Dependence of the breakdown strength on the lamella orientation at the semiconducting interface in improved XLPE power cables, 15:21863 (R;JP;In Japanese)

UK ATOMIC ENERGY AGENCY
See UKAEA

UKAEA
Health Physics, Safety and Medical Services report for 1988, 15:23197 (R;GB)

ULCC
See TANKER SHIPS

ULTRACOLD NEUTRONS
The 2nd KEK symposium on ultracold neutrons (UCN) and fundamental physics with slow neutrons, 15:22947 (R;JP;In Japanese)

ULTRAHIGH VOLTAGE DIRECT CURRENT SYSTEMS
See UHV DC SYSTEMS

ULTRAHIGH-SPEED PHOTOGRAPHY
High-speed photography of energetic materials and components with a copper vapor laser, 15:22195 (BA;US)

ULTRASONIC TESTING
Studies on the controllability of sampling concepts for ultrasonic testing of welds in nuclear engineering, 15:22280 (R;DE;In German)
Studies on the controllability of sampling concepts for ultrasonic testing of welds in nuclear engineering, 15:22279 (R;DE;In German)

ULTRAVIOLET RADIATION
Fundamental aspects of the mechanisms of gamma-radiation and ultraviolet-radiation, 15:22766 (RA;NL;In Dutch)

UNDERGROUND DISPOSAL
Analysis of proposed post-closure alternatives for the Bear Creek Burial Grounds, 15:21515 (R;US)
Design of a high-level waste repository system for the United States, 15:21505 (R;US)
The Nirex safety assessment research programme: Annual report for 1987/88, 15:21508 (R;GB)
[The role of colloidal particles on the subsurface transport of contaminants]: Foreign trip report, January 31, 1990–February 9, 1990, 15:21514 (R;US)

UNDERGROUND EXPLOSIONS
A linear filtering technique for removal of low-frequency noise, 15:22481 (R;US)
Comparison of the spectral characteristics of nuclear explosions detonated below and above the water table. Report for March 1988-February 1989, 15:22479 (R;US)

UNDERWATER OPERATIONS
A diverless pipeline repair system using hyperbaric welding and remote vehicle, 15:22306 (RA;CA)
Self propelled pipeline trencher for offshore Arctic application, 15:22292 (RA;CA)
Subsea multiwell silo drilling/production system, 15:21298 (RA;CA)

UNLEADED GASOLINE
CRC (Coordinating Research Council) octane number requirement survey, 1988, 15:21306 (R;US)

URANIUM
Actinide speciation, further development and application of laser induced photoacoustic spectroscopy and voltammetry, 15:22204 (R;GB)
Environmental regulatory update table, February 1990, 15:22551 (R;US)
Environmental regulatory update table, January 1990, 15:22550 (R;US)
IGT world reserves survey: A survey of United States and total world production, proved reserves, and remaining recoverable resources of fossil fuels and uranium as of December 31, 1987, 15:21161 (R;US)
In the beginning: Measurements of uranium, 15:21446 (J;US)
Measurements of minor and trace elements in nuclear materials, 15:21447 (J;US)

URANIUM 235
Derivation of decay heat benchmarks for U235 and Pu239 by a least squares fit to measured data, 15:21717 (R;GB)
Rapid chemical separation of fission products by ion-chromatography, 15:22205 (RA;JP;In Japanese)
Revision of fast reactor group constant set JFS-3-J2, 15:21709 (R;JP;In Japanese)

URANIUM 238
Revision of fast reactor group constant set JFS-3-J2, 15:21709 (R;JP;In Japanese)

URANIUM ALLOYS
See also URANIUM BASE ALLOYS
Mechanical behavior of aged uranium-3/4 weight percent titanium alloy, 15:22118 (R;US)
Phase in U-Si alloys, 15:21747 (RA;US)

URANIUM BASE ALLOYS
Differential thermal analyzer for research on plutonium fuels and its application to analysis of phase diagrams for alloy systems, 15:21442 (R;JP;In Japanese)
High energy magnetic neutron scattering in heavy fermion compounds, 15:22967 (R;GB)

URANIUM COMPOUNDS
See also URANIUM OXIDES
URANIUM SILICIDES
Reaction of Tris(cyclopentadienyl)uranium compounds with amines, azides, and related ligands, 15:22235 (R;US)

URANIUM DEPOSITS
Role of ductile shearing in the concentration of radon in the Brookneal zone, Virginia, 15:22586 (J;US)

URANIUM DIOXIDE
Calculation of thermodynamic properties for monomeric U(IV) hydrolysis products at 298.15 K and zero ionic strength, 15:21499 (R;US)
On fabrication of UO_2 microspheres by internal gelation process, 15:21443 (R;JP)

URANIUM HEXAFLUORIDE
Liquid-phase compositions from vapor-phase analyses: 7, Preliminary calculations concerning arsenic trifluoride (AsFsub 3) and arsenic pentafluoride (AsFsub 5), 15:21450 (R;US)

URANIUM OXIDES
See also URANIUM DIOXIDE
URANIUM OXIDES U3O8
Radiative properties of UO^+. Technical report, 15 April 1988-15 April 1989. 15:22844 (R;US)

URANIUM OXIDES U3O8
Properties of U_3O_8-aluminum cermet fuel, 15:21451 (R;US)
Reactions during the processing of U_3O_8-Al cermet fuels, 15:21441 (R;US)

URANIUM SILICIDES
Analysis of uranium silicide fuel for the Ford nuclear reactor, 15:21783 (RA;US)
LEU silicide programs at Babcock and Wilcox, 15:21749 (RA;US)
Neutronic scoping calculations for OSURR core design with standardized U_3Si_2 fuel plates, 15:21768 (RA;US)
Safety studies on the production of silicide fuel with low uranium enrichment in the framework of the AF programme, project no. 13. Final report, 15:21731 (R;DE;In German)

URANUS PLANET
Magnetospheric plasma physics, 15:22841 (R;GB)

URBAN AREAS
Catching our breath: Next steps for reducing urban ozone, 15:22512 (R;US)

UREA
Modern biofuel cells for waste recycling in life support systems. Final report, 15:21957 (R;US)

WATER POLLUTION
Health assessment for Combe Fill South Landfill, Morris County, New Jersey, Region 2. CERCLIS No. NJD094966611. Final report, 15:22626 (R;US)
Initiation decision report: Nonpoint source discharge. Technical note (Final), July 1987-June 1988, 15:22587 (R;US)
Quantity and quality of stormwater runoff recharged to the Floridan aquifer system through two drainage wells in the Orlando, Florida area, 15:22610 (R;US)

Environmental Exposure
Health assessment for Anchor Lith Kemko, Hicksville, New York, Region 2. CERCLIS No. NYD001485226. Preliminary report, 15:22672 (R;US)
Health assessment for Applied Environmental Services, Glenwood Landing, New York, Region 2. CERCLIS No. NYD980535652. Preliminary report, 15:22568 (R;US)
Health assessment for Barceloneta Landfill, Florida Afuefra, Puerto Rico, Region 2. CERCLIS No. PRD98059129. Preliminary report, 15:22688 (R;US)
Health assessment for Batavia Landfill, Genesee County, Batavia, New York, Region 2. CERCLIS No. NYD980507693. Preliminary report, 15:22670 (R;US)
Health assessment for Beachwood Borough and Berkeley Township National Priorities List (NPL) Site, Ocean County, New Jersey, Region 2. CERCLIS No. NJD980654123. Final report, 15:22618 (R;US)
Health assessment for Bog Creek Farm Site (BCFS) National Priorities List (NPL) site, Howell Township, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD063157150. Final report, 15:22619 (R;US)
Health assessment for Burnt Fly Bog National Priorities List Site, Marlboro, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD980504997. Final report, 15:22620 (R;US)
Health assessment for Byron Barrel, Genesee County, Byron, New York, Region 2. CERCLIS No. NYD980780670. Preliminary report, 15:22671 (R;US)
Health assessment for CPS/Madison Industries, Old Bridge Township, Middlesex County, New Jersey, Region 2. CERCLIS No. NJD002141190. Preliminary report, 15:22627 (R;US)
Health assessment for Caldwell Trucking Company, Fairfield, New Jersey, Region 2. CERCLIS No. NJD048798953. Preliminary report, 15:22554 (R;US)
Health assessment for Chemical Control Corporation, Elizabeth, New Jersey, Region 2. CERCLIS No. NJD000607481. Final report, 15:22621 (R;US)
Health assessment for Chemical Leaman Tank Lines, Inc. (CLTL) NPL (National Oriorities List) site, Logan Township, Gloucester County, New Jersey, Region 2. CERCLIS No. NJD047321443. Final report, 15:22622 (R;US)
Health assessment for Chemsol Inc., Piscataway, Middlesex County, New Jersey, Region 2. CERCLIS No. NJD980528889. Preliminary report, 15:22623 (R;US)
Health assessment for Ciba-Geigy National Priorities List (NPL) site, Dover Township, Ocean County, New Jersey, Region 2. CERCLIS No. NJD00150217. Final report, 15:22624 (R;US)

Health assessment for Claremont Poly Chemical Corp., Nassau County, Old Bethpage, New York, Region 2. CERCLIS No. NYD002044584. Preliminary report, 15:22673 (R;US)

Health assessment for Colesville Landfill, Broome County, Colesville, New York, Region 2. CERCLIS No. NYD980768691. Preliminary report, 15:22674 (R;US)

Health assessment for Cortese Landfill, Sullivan County, Tusten, New York, Region 2. CERCLIS No. NYD980528475. Preliminary report, 15:22569 (R;US)

Health assessment for Curcio Scrap Metal Yard, Saddle Brook Township, Bergen County, New Jersey, Region 2. CERCLIS No. NJD011717584. Preliminary report, 15:22628 (R;US)

Health assessment for D'Imperio Property Site, Hamilton Township, New Jersey, Region 2. CERCLIS No. NJD980529416. Final report, 15:22629 (R;US)

Health assessment for Derewal Chemical Company National Priorities List (NPL) site, Kingwood Township, Hunterdon County, New Jersey, Region 2. CERCLIS No. NJD980761373. Preliminary report, 15:22630 (R;US)

Health assessment for Diamond Alkali/80 Lister Avenue, Newark, New Jersey, Region 2. CERCLIS No. NJD980528996. Final report, 15:22631 (R;US)

Health assessment for Evor Phillips Leasing, Old Bridge Township, Middlesex County, New Jersey, Region 2. CERCLIS No. NJD980654222. Preliminary report, 15:22632 (R;US)

Health assessment for F.M.C. Corporation, Orleans County, Shelby, New York, Region 2. CERCLIS No. NYD000511857. Preliminary report, 15:22570 (R;US)

Health assessment for Facet Enterprises, Inc., Chemung County, Elmira Heights, New York, Region 2. CERCLIS No. NYD073675514. Preliminary report, 15:22676 (R;US)

Health assessment for Fairlawn Wellfield, Fairlawn, New Jersey, Region 2. CERCLIS No. NJD980654107. Preliminary report, 15:22633 (R;US)

Health assessment for Fibers Public Supply Wells, Guayama, Puerto Rico, Region 2. CERCLIS No. PRD980763783. Preliminary report, 15:22574 (R;US)

Health assessment for Fort Dix Sanitary Landfill, Pemberton Township, New Jersey, Region 2. CERCLIS No. NJ2210020275. Preliminary report, 15:22634 (R;US)

Health assessment for Fulton Terminals Site, Fulton, New York, Region 2. CERCLIS No. NYD980593099. Final report, 15:22669 (R;US)

Health assessment for General Electric Wiring Devices, Juana Diaz, Puerto Rico, Region 2. CERCLIS No. PRD090282757. Final report, 15:22573 (R;US)

Health assessment for General Motors Central Foundry, St. Lawrence County, Massena, New York, Region 2. CERCLIS No. NYD091972554. Preliminary report, 15:22667 (R;US)

Health assessment for Genzale Plating, Franklin Square, New York, Region 2. CERCLIS No. NYD002050110. Preliminary report, 15:22666 (R;US)

Health assessment for Goldisc Recording, Holbrook, New York, Region 2. CERCLIS No. NYD980768717. Preliminary report, 15:22665 (R;US)

Health assessment for Goose Farm National Priorities List (NPL) site, Plumsted Township, Ocean County, New Jersey, Region 2. CERCLIS No. NJD980530109. Final report, 15:22635 (R;US)

Health assessment for Griffiss Air Force Base NPL (National Priorities List) site, Rome, Oneida County, New York, Region 2. CERCLIS No. NY4571924451. Final report, 15:22664 (R;US)

Health assessment for Haviland Complex National Priorities List (NPL) site, Hyde Park, New York, Region 2. CERCLIS No. NYD980785661. Final report, 15:22663 (R;US)

Health assessment for Hercules Inc., Gibbstown, Glocester County, New Jersey, Region 2. CERCLIS No. NJD002349058. Preliminary report, 15:22636 (R;US)

Health assessment for Hertel Landfill Inc., Ulster County, Plattekill, New York, Region 2. CERCLIS No. NYD980780779. Preliminary report, 15:22662 (R;US)

Health assessment for Hooker Chemical (102nd Street Landfill), Niagara Falls, New York, Region 2. CERCLIS No. NYD980506810. Preliminary report, 15:22661 (R;US)

Health assessment for Hooker/Ruco, Hicksville, New York, Region 2. CERCLIS No. NYD002920312. Preliminary report, 15:22566 (R;US)

Health assessment for Horstmann's Dump, East Hanover, New Jersey, Region 2. CERCLIS No. NJD981084577. Preliminary report, 15:22556 (R;US)

Health assessment for Hudson River PCB (polychlorinated biphenyl) NPL (National Priorities List) site, State of New York, Region 2. CERCLIS No. NYD980763841. Final report, 15:22659 (R;US)

Health assessment for Hyde Park Landfill National Priorities List (NPL) site, Niagara Falls, New York, Region 2. CERCLIS No. NYD000831644. Final report, 15:22660 (R;US)

Health assessment for Islip Sanitary Landfill, Suffolk County, New York, Region 2. CERCLIS No. NYD980506901. Preliminary report, 15:22658 (R;US)

Health assessment for Johnstown City Landfill, Fulton County, Johnstown, New York, Region 2. CERCLIS No. NYD980506927. Preliminary report, 15:22677 (R;US)

Health assessment for Jones Sanitation Landfill (Jones Septic Site), Hyde Park, Dutchess County, New York, Region 2 CERCLIS No. NYD980534556. Preliminary report, 15:22572 (R;US)

Health assessment for Juncos Landfill, Juncos, Puerto Rico, Region 2. CERCLIS No. PRD980512362. Final report, 15:22529 (R;US)

Health assessment for Kentucky Avenue Wellfield National Priorities List (NPL) site, Horseheads, Chemung County, New York, Region 2. CERCLIS No. NYD981560428. Final report, 15:22678 (R;US)

Health assessment for Kin-Buc Landfill, Edison Township, New Jersey, Region 2. CERCLIS No. NJD049860836. Final report, 15:22637 (R;US)

Health assessment for Lang Property National Priorities List (NPL) site, Pemberton Township, Burlington County, New Jersey, Region 2. CERCLIS No. NJD980505382. Final report, 15:22638 (R;US)

Health assessment for Liberty Industrial Finishing, Nassau County, Farmingdale, New York, Region 2. CERCLIS No. NYD000337295. Preliminary report, 15:22679 (R;US)

Health assessment for Lone Pine Landfill National Priorities List (NPL) site, Freehold, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD980505424. Final report, 15:22639 (R;US)

Health assessment for Ludlow Landfill National Priorities List (NPL) site, Clayville, Oneida County, New York, Region 2. CERCLIS No. NYD013468939. Final report, 15:22680 (R;US)

Health assessment for Malta Rocket Test Site, Saratoga County, Malta, New York, Region 2. CERCLIS No. NYD980535124. Preliminary report, 15:22681 (R;US)

Health assessment for Mannheim Avenue Dump, Galloway Township, New Jersey, Region 2. CERCLIS No. NJD980654180. Preliminary report, 15:22641 (R;US)

Health assessment for Marathon Battery, Cold Springs, New York, Region 2. CERCLIS No. NYD001959757. Preliminary report, 15:22571 (R;US)

Health assessment for Matlack, Incorporated, Swedesboro, Gloucester County, New Jersey, Region 2. CERCLIS No. NJD043584101. Preliminary report, 15:22640 (R;US)

Health assessment for Monroe Township Landfill, Monroe, New Jersey, Region 2. CERCLIS No. NJD980505671. Preliminary report, 15:22642 (R;US)

Health assessment for Montgomery Township Housing Development, Montgomery, New Jersey, Region 2. CERCLIS No. NJD980654164. Final report, 15:22643 (R;US)

Health assessment for N.L. Industries, Inc., Pedricktown, New Jersey, Region 2. CERCLIS No. NJD061843249. Preliminary report, 15:22647 (R;US)

Health assessment for Nascolite Corporation, Millville, New Jersey, Region 2. CERCLIS No. NJD002362705. Final report, 15:22644 (R;US)

Health assessment for Naval Air Engineering Center, Lakehurst, Ocean County, New Jersey, Region 2. CERCLIS No. NJ7170023744. Preliminary report, 15:22645 (R;US)

Health assessment for Nepera Chemical Co., Orange County, Maybrook, New York, Region 2. CERCLIS No. NYD000511451. Preliminary report, 15:22682 (R;US)

Health assessment for Niagara County Refuse Disposal, Niagara County, New York, Region 2. CERCLIS No. NYD000514257. Preliminary report, 15:22683 (R;US)

Health assessment for North Sea Landfill, Suffolk County, North Sea, New York, Region 2. CERCLIS No. NYD980762520. Preliminary report, 15:22684 (R;US)

Health assessment for Olean Well Field National Priorities List (NPL) site, Olean Cattaraugus County, New York, Region 2. CERCLIS No. NYD980528657. Final report, 15:22685 (R;US)

Health assessment for PJP Landfill, Judson County, Jersey City, New Jersey, Region 2. CERCLIS No. NJD980505648. Preliminary report, 15:22648 (R;US)

Health assessment for Pasley Solvents and Chemical, Garden City, New York, Region 2. CERCLIS No. NYD991292004. Preliminary report, 15:22575 (R;US)

Health assessment for Pijak Farm, Plumsted Township, New Jersey, Region 2. CERCLIS No. NJD980532808. Final report, 15:22558 (R;US)

Health assessment for Port Washington Landfill, North Hempstead, New York, Region 2. CERCLIS No. NYD980654206. Preliminary report, 15:22703 (R;US)

Health assessment for RCA del Caribe, Inc., Barceloneta, Puerto Rico, Region 2. CERCLIS No. PRD090370537. Preliminary report, 15:22687 (R;US)

Health assessment for Ramapo Town Landfill, Rockland County, Ramapo, New York, Region 2. CERCLIS No. NYD000511493. Preliminary report, 15:22702 (R;US)

Health assessment for Reich Farm National Priorities List (NPL) site, Pleasant Plains, Ocean County, New Jersey, Region 2. CERCLIS No. NJD980529713. Final report, 15:22559 (R;US)

Health assessment for Renora Site, Edison Township (bonhamtown), New Jersey, Region 2. CERCLIS No. NJD070415005. Final report, 15:22649 (R;US)

Health assessment for Syosset Landfill, Nassau County, Syosset, New York, Region 2. CERCLIS No. NYD000511360. Preliminary report, 15:22693 (R;US)

Health assessment for Tabernacle Drum Dump National Priorities List (NPL) site, Tabernacle Township, Burlington County, New Jersey, Region 2. CERCLIS No. NJD980761357. Final report, 15:22656 (R;US)

Health assessment for Tronic Plating Co. Inc., Suffolk County, Farmingdale, New York, Region 2. CERCLIS No. NYD002059517. Preliminary report, 15:22692 (R;US)

Health assessment for Universal Oil Products National Priorities List (NPL) site, East Rutherford, New Jersey, Region 2. CERCLIS No. NJD002005106. Preliminary report, 15:22563 (R;US)

Health assessment for Vega Alta Public Supply Wells Site, Vega Alta, Puerto Rico, Region 2. CERCLIS No. PRS187147. Final report, 15:22686 (R;US)

Health assessment for Ventron/Velsicol, Wood-Ridge Borough, Bergen County, New Jersey, Region 2. CERCLIS No. NJD980529879. Preliminary report, 15:22564 (R;US)

Health assessment for Volney Landfill, Volney, New York, Region 2. CERCLIS No. NYD980509376. Final report, 15:22691 (R;US)

Health assessment for Waldick Aerospace Devices, Monmouth County, New Jersey, Region 2. CERCLIS No. NJD054981337. Final report, 15:22565 (R;US)

Health assessment for Warwick Landfill, Orange County, Warwick, New York, Region 2. CERCLIS No. NYD980506679. Preliminary report, 15:22690 (R;US)

Health assessment for Woodland Route 532 Dump, Woodland Township, Burlington County, New Jersey, Region 2. CERCLIS No. NJD980505887. Preliminary report, 15:22657 (R;US)

Health assessment for Woodlands Route 72 Dump, Woodland Township, Burlington County, New Jersey, Region 2. Cerclis No. NJD980505879. Preliminary report, 15:22617 (R;US)

Health assessment for York Oil Company, Moira, New York, Region 2. CERCLIS No. NYD000511733. Final report, 15:22689 (R;US)

Health assessment for richardson Hill Landfill, Delaware County, Sidney, New York, Region 2. CERCLIS No. NYD980507735. Preliminary report, 15:22701 (R;US)

Health assessment for the Endicott Wellfield Site, Broome County, New York, Region 2. CERCLIS No. NYD980780746. Final report, 15:22675 (R;US)

Remedial Action

Hazardous materials waste disposal. June 1987-May 1989 (Citations from the NTIS data base). Report for June 1987-May 1989, 15:22060 (R;US)

Hazardous materials waste disposal. June 1989-January 1990 (Citations from the NTIS data base). Report for June 1989-January 1990, 15:22061 (R;US)

Health assessment for Combe Fill North Landfill, Mount Olive Township, New Jersey, Region 2. CERCLIS No. NJD980530596. Final report, 15:22625 (R;US)

Health assessment for Ge-Moreau, South Glen Falls, New York, Region 2. CERCLIS No. NYD980052335. Final report, 15:22668 (R;US)

Remote Sensing

Remote sensing applied to environmental-pollution detection and management. July 1987-January 1990 (Citations from the NTIS data base). Report for July 1987-January 1990, 15:22535 (R;US)

WATER POLLUTION ABATEMENT
Mechanisms for stream corridor protection. Final report, 15:22614 (R;US)

WATER QUALITY
Environmental sampling and mud sampling program of CSDP [Continental Scientific Drilling Program] core hole VC-2B, Valles Caldera, New Mexico, 15:21633 (R;US)
Mechanisms for stream corridor protection. Final report, 15:22614 (R;US)
Trend detection in the presence of covariates: Stagewise versus multiple regression, 15:22590 (R;US)
Water Science and Technology Board annual report, 1984: [Final report], 15:22596 (R;US)
Water Science and Technology Board annual report, 1985: [Final report], 15:22595 (R;US)
Water Science and Technology Board annual report, 1986: Annual report, 1986, 15:22594 (R;US)
Water Science and Technology Board annual report, 1987: Annual report, 1987, 15:22593 (R;US)
Water Science and Technology Board annual report, 1988, 15:22592 (R;US)
Water quality monitoring, 15:21638 (RA;US)

WATER RECLAMATION
Alberta's Reclamation Research Program, 15:21914 (RA;CA)

WATER SOURCE HEAT PUMPS
Direct expansion systems, 15:22048 (RA;DE)
Pilot study of commercial water-loop heat pump compressor life: Final report, 15:21972 (R;US)
System configurations, 15:21977 (RA;DE)

WATER SUPPLY
Health assessment for Montgomery Township Housing Development, Montgomery, New Jersey, Region 2. CERCLIS No. NJD980654164. Final report, 15:22643 (R;US)
Health assessment for Olean Well Field National Priorities List (NPL) site, Olean Cattaraugus County, New York, Region 2. CERCLIS No. NYD980528657. Final report, 15:22685 (R;US)
Health assessment for Suffern Well Field NPL (National Priorities List) site, Village of Suffern, Rockland County, New York, Region 2. CERCLIS No. NYD980780878. Final report, 15:22694 (R;US)
Health assessment for Vega Alta Public Supply Wells Site, Vega Alta, Puerto Rico, Region 2. CERCLIS No. PRS187147. Final report, 15:22686 (R;US)

WATER TREATMENT
Activated charcoal filters: Water treatment, pollution control, and industrial applications. October 1970-October 1989 (Citations from the US Patent data base). Report for October 1970-October 1989, 15:22705 (R;US)
Incineration of creosote and pentachlorophenol wood-preserving waste-water-treatment sludges. Report for October 1986-September 1989, 15:22051 (R;US)
Water treatment by reverse osmosis. November 1970-October 1989 (Citations from the US Patent data base). Report for November 1970-October 1989, 15:22704 (R;US)

WATER VAPOR
Comparison of the layer structure of vapor phase and leached SRL glass by use of AEM [analytical electron microscopy] (Yucca Mountain Project), 15:21461 (R;US)

WATER WELLS
Environmental effects on corrosion in the Tuff repository, 15:21512 (R;US)
Selected quality assurance data for water samples collected by the US Geological Survey, Idaho National Engineering Laboratory, Idaho, 1980 to 1988, 15:22543 (R;US)

WATERBORNE PARTICLES
See PARTICULATES

WATERFLOODING
A three-dimensional, three-phase, simulator for permeability modification treatments using gelled polymers, 15:21288 (R;US)
Microseismic monitoring of the Chaveroo oil field, New Mexico, 15:21287 (R;US)

WAVE PROPAGATION
Experimental and theoretical study of artificial plasma layers produced by two intersecting beams in a chamber, 15:23060 (R;US)

WAVEGUIDES
Theory of a periodic cylindrical waveguide with a nonuniform metal-dielectric filling, 15:22368 (R;SU;In Russian)

WAVES (SHOCK)
See SHOCK WAVES

WAZ 16
See NICKEL BASE ALLOYS

WEAK INTERACTIONS
Neutrino oscillations at accelerators, 15:22894 (R;FR)

WEAPONS
See also CHEMICAL WARFARE AGENTS
NUCLEAR WEAPONS
Chemistry and materials science research report: Second half FY89, 15:22476 (R;US)

WEAR
Measurements of tribological behavior of advanced materials: Summary of US results on VAMAS (Versailles Advanced Materials and Standards) Round-Robin No. 2, 15:22286 (R;US)
Tribology. June 1970-May 1985 (Citations from the NTIS data base). Report for June 1970-May 1985, 15:22288 (R;US)
Tribology. June 1985-December 1989 (Citations from the NTIS data base). Report for June 1985-December 1989, 15:22289 (R;US)

WECS
See WIND TURBINES

WELDED JOINTS
Properties of hyperbaric flux cored arc welds: Weld metal chemistry, 15:22114 (R;DE)
Properties of wet welded joints, 15:22113 (R;DE)
Studies on the controllability of sampling concepts for ultrasonic testing of welds in nuclear engineering, 15:22280 (R;DE;In German)
Studies on the controllability of sampling concepts for ultrasonic testing of welds in nuclear engineering, 15:22279 (R;DE;In German)
Weld repair issues in thick section austenitic pipework, 15:21725 (R;GB)

WELDS
See WELDED JOINTS

WELL CASINGS
Geomechanics monitoring of cyclic steam stimulation operations in the Clearwater Formation, 15:21423 (RA;CA)

WELL DRILLING
Optimized cluster drilling in the Orinoco Heavy Oil Belt, 15:21221 (RA;US)

WELL LOGGING EQUIPMENT
Thermal front tracking with cross borehole electromagnetic imaging, 15:21280 (RA;US)

WELLHEADS
Gloryhole tool design, fabrication and opeation, 15:21301 (RA;CA)
Subsea multiwell silo drilling/production system, 15:21298 (RA;CA)

WENDELSTEIN-7 STELLARATOR
Overview on Wendelstein VII-X, 15:23023 (RA;DE)
Ballooning Instability
Resistive ballooning modes in a Helias configuration, 15:23027 (RA;DE)
Resistive ballooning modes in stellarators, 15:23026 (RA;DE)
Beam Injection Heating
NBI-heating of W7X using ASDEX-upgrade type NI-boxes, 15:23127 (RA;DE)
Confinement Time
Plasma parameter estimates for Wendelstein VII-X, 15:23034 (RA;DE)
Current-Drive Heating
ECRH for WVII-X: Heating and current drive, 15:23037 (RA;DE)
Experiments in W 7AS and projections to W 7X, 15:23033 (RA;DE)

Ecr Heating
ECRH for WVII-X: Heating and current drive, 15:23037 (RA;DE)
Experiments in W 7AS and projections to W 7X, 15:23033 (RA;DE)
Equilibrium Plasma
Non-local MHD-mode analysis of Helias equilibria, 15:23025 (RA;DE)
Icr Heating
ICRH for W VII-X, 15:23036 (RA;DE)
Magnet Coils
Coil studies for Helias configurations, 15:23115 (RA;DE)
Engineering status of the W VII-AS coil system, 15:23119 (RA;DE)
Forces and stresses Helias coil systems, 15:23117 (RA;DE)
On normal-conducting versions for W VII-X, 15:23120 (RA;DE)
On separation in mechanical behaviour of non-planar coil systems, 15:23118 (RA;DE)
Parameter variations for W VII-X vacuum fields, 15:23116 (RA;DE)
Magnetic Fields
On edge fields and limiter/wall loads in HS5-8, 15:23122 (RA;DE)
Parameter variations for W VII-X vacuum fields, 15:23116 (RA;DE)
Magnetic Islands
Island formation in stellarators, 15:23123 (RA;DE)
On natural magnetic islands and external perturbations in Helias vacuum fields, 15:23125 (RA;DE)
On the reduction of magnetic islands, residues in HS 5-7, 15:23124 (RA;DE)
Magnetohydrodynamics
Non-local MHD-mode analysis of Helias equilibria, 15:23025 (RA;DE)
Meetings
Proceedings of the 3rd workshop on Wendelstein VII-X, 15:23022 (R;DE)
Neoclassical Transport Theory
Monte Carlo calculations for Helias configurations, 15:23028 (RA;DE)
Neoclassical transport (DKES code), 15:23030 (RA;DE)
Ripple transport in a modular Helias, 15:23029 (RA;DE)
Neutral Atom Beam Injection
NBI-heating of W7X using ASDEX-upgrade type NI-boxes, 15:23127 (RA;DE)
Neutral injection into Wendelstein VII-X, 15:23126 (RA;DE)
Neutral Particles
Neutral gas behaviour in the plasma edge of Wendelstein VII-X, 15:23032 (RA;DE)
Optimization
Optimization of Helias for W VII-X, 15:23024 (RA;DE)
Plasma Confinement
Experiments in W 7AS and projections to W 7X, 15:23033 (RA;DE)
Superconducting Coils
Tests for superconducting W VII-X coils (short samples, small test coil, prototype coil with KfK-LCT coil), 15:23121 (RA;DE)
Superconducting Magnets
W VII-X engineering, 15:23114 (RA;DE)
Thermal Conductivity
Plasma parameter estimates for Wendelstein VII-X, 15:23034 (RA;DE)

WEST GERMANY
See FEDERAL REPUBLIC OF GERMANY

WEST VIRGINIA
Analysis of Devonian shale stratigraphic, production, and completion data in West Virginia. Final report, July 1, 1984-July 31, 1988, 15:21355 (R;US)

WETLANDS
Environmental feasibility of using wetlands to treat runoff pollution. Final report, 15:22588 (R;US)

WHISKERS
Synthesis of alumina-coated SiC whiskers for production of SiC whisker-reinforced alumina composite materials, 15:22150 (R;US)

WHOLE-BODY IRRADIATION
Survival after total-body irradiation. 1. Effects of partial small bowel shielding, 15:22739 (R;US)

WIGGLER MAGNETS
Analysis and nonlinear simulation of quadrupole and dipole wiggler FELs for millimeter waves, 15:23179 (BA;US)
Computation of synchrotron radiation from bending magnet and wiggler, 15:23214 (R;JP)

WILD ANIMALS
Biological and ecological site characterization of the Feed Materials Production Center, June 1986–June 1987, 15:21542 (R;US)
Environmental monitoring master sampling schedule, January–December 1990, 15:22706 (R;US)
The ecology of hydric hammocks: A community profile, 15:22542 (R;US)

WILDERNESS AREAS
See NATURE RESERVES

WIND
Retrieval of wind fields from Doppler measurements of a single radar and application on a cold front with narrow rain band, 15:22497 (R;DE;In German)

WIND ENERGY CONVERSION SYSTEMS
See WIND TURBINES

WIND GENERATORS
See ELECTRIC GENERATORS
WIND TURBINES

WIND POWER
Japan's Sunshine Project. 1988 Annual summary of comprehensive research, 15:21909 (R;JP;In Japanese)
Japan's Sunshine Project. 1988 Annual summary of comprehensive research, 15:21910 (R;JP)
Prospecting site technical summary for 1987/88, 15:21653 (R;CA)

WIND POWER PLANTS
Wind turbines and generators for wind power plants. January 1976-April 1985 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for January 1976-April 1985, 15:21650 (R;US)
Wind turbines and generators for wind power plants. May 1985-December 1989 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for May 1985-December 1989, 15:21651 (R;US)

WIND TURBINES
See also HORIZONTAL AXIS TURBINES
VERTICAL AXIS TURBINES
A study on Wind Energy Conversion Systems (WECS), cost evaluation, and prospects for cost reduction: Final report, 15:21645 (R;CA)
PC-based PCM telemetry data reduction system software, 15:21652 (R;US)
Wind turbines and generators for wind power plants. January 1976-April 1985 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for January 1976-April 1985, 15:21650 (R;US)
Wind turbines and generators for wind power plants. May 1985-December 1989 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for May 1985-December 1989, 15:21651 (R;US)

WINDOWS
Porous transparent aerogels: Development of superinsulating window technology: Appendix 2, 15:22174 (R;CA)

WIPP
An approach to calculating upper bounds on maximum individual doses from the use of contaminated well water following a WIPP [Waste Isolation Pilot Plant] repository breach, 15:21484 (R;US)
EEG review comments on the geotechnical reports provided by DOE to EEG under the stipulated agreement through March 1, 1983, 15:21485 (R;US)
Occurrence of gases in the Salado information, 15:21487 (R;US)
Potential problems from shipment of high-curie content Contact-Handled Transuranic (CH-TRU) waste to WIPP [Waste Isolation Pilot Plant], 15:21486 (R;US)

Radioactive waste disposal: Waste Isolation Pilot Plants (WIPP). March 1978-November 1989 (Citations from the NTIS data base). Report for Mar 78-Nov 89, 15:21520 (R;US)
Review comments on the report of the Steering Committee on Waste Acceptance Criteria for the Waste Isolation Pilot Plant, 15:21482 (R;US)
The significance of certain Rustler aquifer parameters for predicting long-term radiation doses from WIPP [Waste Isolation Pilot Plant], 15:21483 (R;US)

WIRES
See also SUPERCONDUCTING WIRES
Comparison of calculated and measured irradiated wire data for high-enrichment uranium (HEU) and mixed HEU/LEU cores in the ORR, 15:21762 (RA;US)

WOLFRAM
See TUNGSTEN

WOOD
Charcoal production in Tanzania using improved traditional earth kilns, 15:21585 (R;CA)
Chemicals and fuels from biomass flash pyrolysis- part of the Bioenergy Development Program (BDP), 15:21586 (R;CA)
Methanogenic gasification of wood, 15:21580 (R;US)

WOOD ALCOHOL
See METHANOL

WOOD BURNING APPLIANCES
See also WOOD BURNING FURNACES
Guideline series: Guidance document for residential wood-combustion emission-control measures, 15:21894 (R;US)
How to use the CSA B415 performance standard to improve furnace efficiency, 15:21587 (R;CA)

WOOD BURNING FURNACES
Evaluation of and operating experience with a Heat Harvester green chip pre-furnance, 1985-1986, 15:21588 (R;CA)

WOOD PRODUCTS INDUSTRY
Evaluation of emission-control devices at waferboard plants. Final report, 15:22519 (R;US)

WOOD WASTES
A test burn of chlorophenol contiminated wood wastes at Northwood pulp mill, Prince George, B.C. [British Columbia]: Summary report, 15:21592 (R;CA)
Establishment of operating parameters for effective mechanical dewatering of wood residues, 15:21583 (R;CA)
Hog fuel availability in the north coastal and interior regions of British Columbia, 1986, 15:21591 (R;CA)

WORKERS
See PERSONNEL

X

X RADIATION
See also SOFT X RADIATION
Prospects for x-ray amplification with charge-displacement self-channeling, 15:22354 (J;US)
Synchrotron studies of x-ray reflectivity from surfaces, 15:22107 (R;US)
X ray microimaging by diffractive techniques: Progress report, 15:22381 (R;US)

X-RASERS
See X-RAY LASERS

X-RAY FLUORESCENCE ANALYZERS
Design, development and construction of an X-ray total reflection module: Final report for the period 15 March 1986 - 11 March 1989, 15:22433 (R;XA)

X-RAY LASERS
Pulsed power driven x-ray laser research at Physics International Company, 15:23192 (BA;US)
The effect of prepulse on x-ray laser development using a powerful subpicosecond KrF- laser, 15:23145 (R;US)
X-ray laser gain optimization studies as function of Z and pump laser wavelength, 15:22343 (BA;US)

X-RAY SPECTROMETERS
High resolution soft X-Ray spectrometer with 5-picosecond time-resolution for laser-produced plasma diagnostics, 15:22986 (R;FR)
Spatially resolved soft x-ray (1 - 33 nm) spectroscopy of tokamak plasmas, 15:22430 (R;FR)

XENON 124
The effective moment of inertia in ^{124}Xe, ^{126}Ba, ^{128}Ba, ^{129}Ce, ^{131}Ce and ^{162}Er isotopes, 15:22917 (R;FR)

XENON FLUORIDES
TOF electron drift measurements in xenon difluoride (XeF_2) and hydrogen sulfide (H_2S) gas mixtures, 15:23083 (BA;US)

Y

Y'RESONANCES
See BARYONS

YELLOW CAKE
See URANIUM OXIDES U3O8

YTTERBIUM OXIDES
Thermodynamic properties of some metal oxide-zirconia systems, 15:22152 (R;US)

YTTRIUM
Corrosion properties of Fe_3Al in H_2S-H_2-H_2O mixtures, 15:21120 (R;US)

YTTRIUM 101
Study of transitional nuclei at TRISTAN: Progress report, 15:22929 (R;US)

YTTRIUM ALUMINIUM GARNETS
See ALUMINIUM OXIDES
YTTRIUM COMPOUNDS

YTTRIUM COMPOUNDS
See also YTTRIUM OXIDES
Elementary steps in the formation of highly dispersed palladium in NaY. II. Particle formation and growth, 15:22227 (J;US)
High resolution transmission electron microscopy study of defect structures in mixed-phase YBaCuO, 15:22972 (R;US)

YTTRIUM OXIDES
Deformation processing of $YBa_2Cu_3O_x$, 15:22140 (R;US)
Polarized x-ray absorption studies of oxide superconductors, 15:22974 (BA;US)
The role of lattice anion vacancies in the activation of CO and as the catalytic site for methanol synthesis over zirconium dioxide and yttria-doped zirconium dioxide, 15:21146 (J;US)
Thermodynamic properties of some metal oxide-zirconia systems, 15:22152 (R;US)

YUCCA MOUNTAIN
Basaltic volcanic episodes of the Yucca Mountain region, 15:21495 (R;US)
Combined analytical/numerical approaches to solving fluid flow problems in the unsaturated zone at Yucca Mountain, 15:21503 (R;US)
Electrochemical corrosion studies on copper-base waste package container materials in unirradiated 0.1 N $NaNO_3$ at 95°C, 15:21524 (R;US)
Study of fractal aperture distribution and flow in fractures, 15:21504 (R;US)
The application of vertical seismic profiling and cross-hole tomographic imaging for fracture characterization at Yucca Mountain, 15:21500 (R;US)
Yucca Mountain Project technical status report, April–September 1989, 15:21513 (R;US)

YUKON TERRITORY
Groundwater resources protection from drilling waste, Northwest Territories and Yukon, 15:21328 (R;CA)

Z

Z PINCH DEVICES (LINEAR)
See LINEAR Z PINCH DEVICES

ZEOLITES
Flexibility of the zeolite RHO framework in-situ x-ray and neutron powder structural characterizations of divalent cation-exchanged zeolite RHO, 15:22198 (R;US)
Fluidized-bed catalytic cracking (FFC) catalyst fabrication: Final report and appendix, 15:21302 (R;CA)

ZINC ARSENIDES
Crystallographic and magnetic properties of $(C_6D_{11}ND_3)CuBr_3$ and $(Zn_{1-x}Mn_x)_3As_2$: A neutron scattering study, 15:22173 (R;NL)

ZIRCONIUM
Corrosion properties of Fe_3Al in H_2S-H_2-H_2O mixtures, 15:21120 (R;US)

ZIRCONIUM 101
Nuclear spectroscopy of neutron-rich odd-A N = 61 isotones in the deformed A ≈ 100 region, 15:22873 (D;US)

ZIRCONIUM 96
In-beam studies of ^{96}Zr and ^{98}Zr: Collective excitations, 15:22931 (R;US)

ZIRCONIUM 98
In-beam studies of ^{96}Zr and ^{98}Zr: Collective excitations, 15:22931 (R;US)

ZIRCONIUM ALLOYS
Studies of the structure and properties of amorphous a-Ar76Fe24Hx, 15:22136 (R;US)

ZIRCONIUM ISOTOPES
See also ZIRCONIUM 101
ZIRCONIUM 96
ZIRCONIUM 98
Nuclear structure effects in exciton level densities, 15:22928 (R;US)

ZIRCONIUM OXIDES
Advances and future directions in superplastic materials, 15:22099 (RA;FR)
Determination of impurities in fine ceramics by inductively coupled plasma atomic emission spectrometry, 15:22155 (R;JP)
Hydrous metal oxide-supported catalysts: Part 1, Preparation chemistry and physical and chemical properties, 15:21140 (R;US)
Influence of diesel engine combustion on the rupture strength of partially stabilized zirconia, 15:22163 (J;US)
The role of lattice anion vacancies in the activation of CO and as the catalytic site for methanol synthesis over zirconium dioxide and yttria-doped zirconium dioxide, 15:21146 (J;US)
Thermodynamic properties of some metal oxide-zirconia systems, 15:22152 (R;US)

Contract Number Index

Numbers assigned to DOE contracts announced in documents in this publication are listed. Contract numbers are sorted alphanumerically and list the primary corporate author of the document cited, the citation number, and the report number or other document identification.

Contract No.	Abstract No.	Report No.
AC01-86IE10509	**ERC International, Fairfax, VA (USA)**

Report Number Index

The report number index consists of the alphanumeric identifiers assigned to report literature as well as patent and conference literature cited in this publication. Entries provide the abstract number; the source(s) of availability of the document; the GPO file prefix for GPO depository library documents; the order number for OSTI and NTIS report ordering purposes; and, if the document was distributed under the DOE distribution program, the category number is shown for paper copy (PC), microfiche (MF), or no distribution (ND). These categories are included to assist DOE librarians in responding to requests for reports in their collections. The index also lists secondary numbers, with the corresponding abstract numbers and cross-references to other identifying numbers.

Report Number	*Abstract Number*	*Source of Availability*	*GPO Dep.*	*Order Number*	*Distribution Category*

Codes Used on Index Lines

Following the citation numbers in the Corporate Author, Personal Author, and Subject Indexes, codes are used to designate the type of document, country of publication, and language of the document, e.g., (R;SU;In Russian). The language designator does not appear if the document is published in English.

ORDER FORM

DOE and DOE Contractors: Fill in Parts I, II, and IV. **Others:** Fill in Parts I, III, and IV. Mark appropriate blanks in Part IV to indicate quantity and form (microfiche or paper copy).

I. SHIPPING AND PAYMENT INFORMATION

Ordering Address

Name _____ Telephone _____

Address _____

City _____ State _____ Zip _____

Shipping Address (if different from above)

Name _____

Address _____

City _____ State _____ Zip _____

_____

SIGNATURE (Required to validate ALL orders)

II. OSTI ORDERS (DOE and DOE contractors can order from OSTI.)

☐ Charge OSTI deposit account no. _____

Mail orders to: U.S. Department of Energy
Office of Scientific and Technical Information
P.O. Box 62
Oak Ridge, TN 37831

III. NTIS ORDERS

☐ Charge NTIS deposit account no.

☐ Check/Money Order enclosed for $

☐ Charge to my ☐ American Express ☐ VISA ☐ Mastercard

_____ _____
Account Number **Card expiration date**

☐ Ship and Bill (see below for restrictions)

Employer identification number (9 digits) _ _–_ _ _ _ _ _ _

Purchase Order number _____

Phone number of billing office _____
(Required for Ship & Bill orders)

Ship & Bill service is restricted to North American business locations for an extra $7.50 per order (or per Custom Search). The business' employer identification number plus the phone number of the office paying the bill are required to process these requests. A late payment charge will be applied to billings more than 30 days overdue. Prepaying, using an NTIS Deposit Account or a charge account, speeds order processing. Be sure payment and order are sent together. Checks, payable to NTIS, must be in U.S. dollars.

Mail orders to: U.S. Department of Commerce
National Technical Information Service
5285 Port Royal Road
Springfield, VA 22161

IF NO METHOD OF PAYMENT IS INDICATED, YOUR ORDER WILL BE RETURNED TO YOU AS A PRICE QUOTE UNPROCESSED.

IV. SELECTIONS

Order number _____ Report number _____

Federal Depository Library Program

As a result of an agreement between the U.S. Government Printing Office (GPO) and the Department of Energy, beginning in 1984 DOE reports with unlimited distribution are now included in the Federal Depository Library Program. The Regional Depository Libraries listed below receive and retain at least one copy of nearly every Federal Government publication, either in printed or microfilm form, for use by the general public. These libraries provide reference services and interlibrary loans; however, they are not sales outlets. You may wish to ask your local library to contact a Regional Depository to help you locate specific publications, or you may contact the Regional Depository yourself. Do not send checks or orders to these libraries.
